Unofficial Comment Form

Project 2023-06 CIP-014 Risk Assessment Refinement

Be aware that this is a public proceeding, and comments are publicly available upon submission. DO NOT include any CEII or otherwise sensitive information in your comments.

Do not use this form for submitting comments. Use the Standards Balloting and Commenting System (SBS) to submit comments on **Project 2023-06 Risk Assessment Refinement** by **8 p.m. Eastern, Wednesday, November 6, 2024.**

Additional information is available on the project page. If you have questions, contact Senior Standards Developer, Ben Wu (via email), or at 470-542-6882.

Background Information

Due to an increase in reports of physical attacks on electric substations, the Federal Energy Regulatory Commission (FERC) issued the December 2022 Order in Docket No. RD23-2-000 directing NERC to evaluate the effectiveness of the Physical Security Reliability Standard CIP-014-3 in mitigating the risks to the Bulk-Power System (BPS) associated with physical attacks. In the report filed in response to a FERC directive, NERC staff identified continuing inconsistency in registered entity CIP-014-3 risk assessments to most appropriately identify critical infrastructure. FERC directed NERC to evaluate whether the physical security protection requirements in NERC's Reliability Standards are adequate to address the risks associated with physical attacks on BPS Facilities, including the adequacy of the required risk assessment in CIP-014-3 Requirement R1. In the report, NERC found that CIP-014-3 required revision to assure adequate and consistent approach in evaluating instability as well as the identification of infrastructure critical to the operation of the BPS.

Questions

1. Do you agree with the modifications made in CIP-014-4 with modified Requirement R1 to address the issues identified in the SAR?

   ☐ Yes
   ☐ No

   Comments:

2. Do you agree with the modifications made in CIP-014-4 with new Requirement R2 to address the issues identified in the SAR?

   ☐ Yes
   ☐ No

   Comments:

3. Do you agree with the modifications made in CIP-014-4 with new Requirement R3 to address the issues identified in the SAR?

   ☐ Yes
   ☐ No

   Comments:

4. Do you agree with the modifications made in CIP-014-4 with new Requirement R4 to address the issues identified in the SAR?

   ☐ Yes
   ☐ No

   Comments:

5. Do you agree with the modifications made in CIP-014-4 with adding Requirement R5 to address the issues identified in the SAR?

   ☐ Yes
   ☐ No

   Comments:

6. Do you agree with the Implementation Plan for CIP-014-4?

   ☐ Yes
   ☐ No

   Comments:

7. Do you agree that CIP-014-4 is cost effective to address the reliability issue of physical security? If no, why not?

   ☐ Yes
   ☐ No

   Comments:

8. Provide any additional comments for the standard drafting team to consider, if desired.

Standards Announcement

Project 2023-06 CIP-014 Risk Assessment Refinement

Be aware that this is a public proceeding, and comments are publicly available upon submission. DO NOT include any CEII or otherwise sensitive information in your comments.

Formal Comment Period Open through November 6, 2024

Now Available

A 45-day formal comment period for **Project 2023-06 CIP-014 Risk Assessment Refinement** is open through **8 p.m. Eastern, Wednesday, November 6, 2024** for the following standard and implementation plan:

- CIP-014-4 – Physical Security
- Implementation Plan

The standard drafting team's considerations of the responses received from the previous comment period are reflected in this draft of the standard.

Reminder Regarding Corporate RBB Memberships

Under the NERC Rules of Procedure, each entity and its affiliates is collectively permitted one voting membership per Registered Ballot Body Segment. Each entity that undergoes a change in corporate structure (such as a merger or acquisition) that results in the entity or affiliated entities having more than the one permitted representative in a particular Segment must withdraw the duplicate membership(s) prior to joining new ballot pools or voting on anything as part of an existing ballot pool. Contact ballotadmin@nerc.net to assist with the removal of any duplicate registrations.

Commenting

Use the Standards Balloting and Commenting System (SBS) to submit comments. An unofficial Word version of the comment form is posted on the project page.

- *Contact NERC IT support directly at https://support.nerc.net/ (Monday – Friday, 8 a.m. - 5 p.m. Eastern) for problems regarding accessing the SBS due to a forgotten password, incorrect credential error messages, or system lock-out.*
- *Passwords expire every **6 months** and must be reset.*
- *The SBS **is not** supported for use on mobile devices.*
- *Please be mindful of ballot and comment period closing dates. We ask to **allow at least 48 hours** for NERC support staff to assist with inquiries. Therefore, it is recommended that users try logging into their SBS accounts **prior to the last day** of a comment/ballot period.*

Next Steps

Additional ballots for the standard and implementation plan, as well as the non-binding poll of the associated Violation Risk Factors and Violation Severity Levels will be conducted **October 28 – November 6, 2024**.

For information on the Standards Development Process, refer to the Standard Processes Manual.

For more information or assistance, contact Senior Standards Developer**,** Ben Wu (via email) or at 470-542-6882. Subscribe to this project's observer mailing list by selecting "NERC Email Distribution Lists" from the "Service" drop-down menu and specify “Project 2023-06 CIP-014 Risk Assessment Refinement observer list” in the Description Box.

1. Do you agree with the modifications made in CIP-014-4 with modified Requirement R1 to address the issues identified in the SAR?

Kevin Conway - Western Power Pool - 4

Answer	No
Document Name	

Comment

There is a disconnect between the listed responsibility in the Applicability Section 4.1 and R1. Does the Drafting team expect ALL TOPs to comply to R1, or ONLY those who have facilities that meet the criteria of Attachment 1? There is a high likelihood that auditors will interpret that ALL TOPs will have to complete R1 and show that they scored their facilities to determine applicability under Attachment 1.

We suggest that the applicability section include ALL TOPs, and the requirements be modified to have all TOPs complete R1, then if they have not met the criteria of Attachment 1, they stop and have no additional compliance obligation. This would more clearly identify who is applicable to the Standard and eliminate a lot of ambiguity of what the auditors will need to verify that an entity is not applicable to the standard.

Tamarra Hardie - Tamarra Hardie On Behalf of: Diane E Landry, Public Utility District No. 1 of Chelan County, 3, 5, 1, 6; - Public Utility District No. 1 of Chelan County - 6, Group Name CHPD

Answer	No
Document Name	Near-Term vs Long-Term - Glossary of Terms.docx

Comment

It appears that the Draft 2 changes to R1 clarified that the list is to be documented once every 36 months for all applicable stations “that are existing or planned to be in service within 36 months”, which is an improvement from the previous draft version. This improves clarity but the R1 VRF Time Horizon still states that R1 applies to ‘Long-term Planning Horizon’, whereas the NERC Glossary of Terms defines the ‘Near-Term Planning Horizon’ as the window covering year 1 through 5. This requirement references ‘within 36 months’, so it is recommended that the R1 VRF Time Horizon language is updated to reference the ‘Near-Term Transmission Planning Horizon’. Please see attached document “Near-Term vs Long-Term - Glossary of Terms”.

Comment
Eversource is looking for clarity on what is meant by the phrase “Planned to be in service.” Eversource suggests either providing more prescriptive language around at what point in the process a project is considered “planned,” or make the following change: Each Transmission Owner, at least once every 36 calendar months, shall document a list of applicable Transmission station(s) and Transmission substation(s) meeting any of the criteria in Attachment 1 that are either existing or planned, **as defined by the Transmission Owner,** to be in service within 36 calendar months**.**

Comment
BPA believes the current language of R1 seems to be intended to create auditable documentation of the same outcome that is already achieved when a Registered Entity evaluates the current Applicability section. BPA suggests restoring applicability content to the Applicability section and changing R1 language for applicable Registered Entities to maintain the list of applicable stations or substations obtained through evaluation of the Applicability section.

MPC strongly disagrees with the use of a 36-month timeframe for utilities who have not previously identified stations or substations as critical for the same reasons specified in our comments for Question 5.

Lucinda Bradshaw - Lucinda Bradshaw On Behalf of: Byron Booker, Oncor Electric Delivery, 1; - Lucinda Bradshaw	
Answer	No
Document Name	
Comment	

Oncor does not agree with the provision requiring consideration of Transmission station(s) and Transmission substation(s) that are planned to be in service within 36 calendar months because that time frame is beyond Oncor’s accurate planning time frame, particularly given the large amount of growth currently being experienced in Oncor’s service area. Instead, Oncor recommends that the provision be revised to require consideration of Transmission station(s) and Transmission substation(s) that are planned to be in service within 24 months.

Comment

Duke Energy still has concerns that the timeline for the performance of R1 is not clear. We recommend that the assessment be performed within 36 months of *the completion* of the previous R1 assessment. We also recommend the end of R1 specify “planned to be in service in the model year three years out from the year in which the assessment is performed”. Years capture more accurately how planning is conducted. As written in draft 2, if the assessment is performed in October 2024, will using a planning model from Summer 2027 be acceptable? With the current language using 36 months, we have concerns that it would not be.

If the drafting team is not willing to consider referencing years for modeling, we recommend that they consider clarifying with a footnote that for planning purposes, the model year should be at least three years out from the start of the assessment.

We agree with the intent of CIP-014-4 to address issues identified in the SAR, however we would like to suggest changes to improve readability.

There is some interplay between R1 and R2 through Attachment 1 that makes identification of “applicable” stations confusing. R1 refers to Attachment 1 to identify “applicable” stations based on the weighting criteria in Table 1. Attachment 1 section 2.1 requires user to refer to R2 and apply proximity criteria to stations that were not applicable in R1.

To meet the intent of SAR to identify station “groups” that meet applicability criteria of Attachment 1, it may be best to identify station groups separately under R2 as a sub-requirement (i.e. move Section 2.1 from Attachment 1 to sub-requirement R2.2) and make Attachment 1 agnostic of stations or station groups. This separates intent of R1 and R2 and allows both requirements to reference Attachment 1 applicability criteria. R1 will identify individual stations that meet Attachment 1 applicability criteria. R2 will identify station groups with stations that were individually non-applicable under R1, but when combined with other non-applicable station(s) - based on proximity criteria of R2, may be applicable per Attachment 1 Table 1.

The CIP-014-4 standard introduces a significant change by requiring the inclusion of stations within a 1/2-mile line of sight or easily accessible from a common roadway. However, the standard lacks clear guidelines for selecting stations. This could lead to inconsistencies and challenges in implementation, as different Transmission Owners and Transmission Operators may interpret and apply the criteria differently.

To improve clarity and ensure consistent implementation, the standard should provide more detailed guidance on the selection of stations, including specific criteria for evaluating lines of sight and ease of access from common roadways. This would help Transmission Owners and Transmission Operators to better understand the requirements and apply them consistently, ensuring the reliability and security of the electrical grid.

The proposed 36 months for the period is not realistic as it is beyond a planning timeframe that would produce meaningful results. Limiting the period to 24 months accounts for issues such as supply chain, construction constraints, and outage planning to maintain a reliable system.

a) From a compliance perspective, it is recommended to provide more prescriptive language in the standard or within the technical rationale, to help entities in identifying planned projects around how a project is considered “planned,” or make the following change:

Each Transmission Owner, at least once every 36 calendar months, shall document a list of applicable Transmission station(s) and Transmission substation(s) meeting any of the criteria in Attachment 1 that are either existing or planned, **as defined by the Transmission Owner**, to be in service within 36 calendar months

b) With respect to the scoring in Attachment one, it’s unclear if transmission lines in series with a stepdown transformer would be included if the secondary voltage was 138 kV (as one example). Could the SDT identify if the scoring is based on the high side voltage or low side voltage? LIPA suggests a footnote identifying the voltage class used to determine qualification should be added below the scoring table.

c) In addition, since 500 kV facilities meet the Attachment 1 criteria 1, it seems as though the line item in the table for 500 kV and above may be removed as to avoid confusion.

There needs to be more explanation on how the ½ mile criteria works with 2.1 and 2.2. As is written, the language in this section is confusing.

Is the ½ mile the maximum distance to consider, but you need to consider the line of sight too criteria too?
If two stations are within ½ mile of each other, but not in a direct line of sight, how does that impact the qualifications?

ATC recommends eliminating 2.1 and 2.2 to remove the confusion or to have some clarifying examples or sentences in the standard to explain how these sections work together.

Also, the inclusion of non-owned substations (i.e., the “irrespective of ownership” language) may also introduce further complications for TOs in their study analysis and should be further clarified what steps need to be taken to account for these non-owned stations.

½ mile is a very wide separation criterion for adjacency. A reasonable separation within 200 feet or so seems a more practical consideration for adjacent substations that may be impacted by a single physical event. An event simultaneously impacting 2 stations with ½ mile separation will be difficult to protect from physical security standpoint and cost prohibitive. This aligns with PSE past comments (in June 2024): *It is not clear the type of events CIP-014-4 intends to address that can simultaneously impact 2 or more stations. The standard depends on physical security measures to mitigate such events, however mitigation to the extent may not be feasible nor cost effective.*

Alison Nickells - NiSource - Northern Indiana Public Service Co. - 1	

Answer	No
Document Name	

Comment

NIPSCO agrees with CenterPoint Energy Houston Electric, LLC (CEHE). *"Line of sight" or "ease of access" in Requirement R2 are arbitrary values and should not be used to comply with NERC requirements*

NIPSCO also agrees with AEP. *The intent is to identify close physical proximity such that a singular event could impact both stations; other ranges are irrelevant.* ***Emphasize explicitly in the standard language or Guidelines and Technical Basis that this considers only a single, simultaneous attack****. Considering non-simultaneous attacks makes the number of scenarios infinite and is not feasible to analyze or protect against.*

NIPSCO also agrees with Georgia Transmission Corp: *The intent of the requirement is understood and appreciated. However, the nature of the "single physical attack" needs clarification. Interpretations of this attack can range from events where elements are lost with some time delay between failures (gun shots for example) to a simultaneous loss of all elements (large explosion?). Clarity on the nature of the physical attack or parameters that can be applied to define the attack are needed to avoid differing interpretations of what event is to be studied and how this requirement is to be audited.*

Additionally, this guidance is appropriately located in the TPL space to clarify to planning entities what type of extreme event needs to be evaluated and subsequently communicated to the Transmission

Ellese Murphy - Ellese Murphy On Behalf of: Katherine Street, Duke Energy , 5, 6, 1, 1; - Ellese Murphy

Answer	No
Document Name	

Comment

Duke Energy does not support the language proposed for R2. The fundamental issue still exists that R2 is not tied to likely threat vectors identified within an entity's security program. We understand that due to the sequencing of the requirements that linking to R8 is not feasible but do think that more general reference to likely threat vectors identified by the entity would create a more meaningful requirement. If the Drafting Team prefers to create R2 in a way that has a uniform distance requirement for proximity sites, we believe that the distance should be based on ballistic threats and a more reasonable distance would be 1000ft. We do not find the ½ mile radius to be technically justified. Duke Energy supports prescribing that line of sight be addressed in documented criteria but does not support prescribing ease of access from a common roadway and supports EEI's comments on this. Ease of access from a common roadway is far more subjective than line of sight and less immediately relevant for a coordinated attack.

It is also still unclear how the criteria can use sites in proximity irrespective of ownership and Duke Energy supports EEI membership's concern on this issue. The requirement to study sites identified in R2 that are not owned by your company creates an unclear path forward for conducting the studies. It is likely that many of these proximity sites will not even be part of the BES and could be owned by entities that do not have any BES assets. There is no mechanism to force these entities to provide the data that would be needed to perform the R3 analysis and comply with CIP-014. We encourage the Drafting Team to consider whether it makes more sense to account for sites of differing ownership when they are determined to be applicable in accordance with Requirement R1 by a different registered entity. Duke Energy recommends the following language for R2:

Each Transmission Owner shall have documented criteria to determine their Transmission station(s) or Transmission substation(s), that are adjacent, adjacent meaning having a perimeter fence within 1000 ft of the perimeter fence of an applicable Transmission station or Transmission substation documented in Requirement R1, that could be impacted by a single physical attack that from likely threats vectors. The Transmission Owner must also include in their criteria identification of adjacent transmission station(s) or substation(s) that are owned and determined to be applicable in accordance with Requirement R1 by a different registered entity. From the adjacent Transmission station(s) or Transmission substation(s), the criteria shall also identify Transmission station(s) or Transmission substation(s) within line of sight from a single location without obstruction of an applicable Transmission station or Transmission substation documented in Requirement R1.

Gail Elliott - Gail Elliott On Behalf of: Michael Moltane, International Transmission Company Holdings Corporation, 1; - Gail Elliott

Answer	No
Document Name	

Comment

Comments: {C}{C}{C} {C}{C}ITC does not support the changes identified in R2. ITC recommends R2 and all its subparts be revised. The proposed R2 language by the drafting team provides concerns due to the high probability of missing a substation located within the 0.5 mile radius as the TO would not have the required information of all existing nearby facilities nor have the information necessary to identify that the electric facility is a transmission station. Furthermore, a TO is to identify any future transmission stations that could be constructed within 3 years which would be even more difficult to locate. ITC proposes the following for R2 and its sub-parts.

If the TO has identified that it has multiple fenced areas on a site that it considers as one station, there is not clarity if R2 would be applicable. Would these instead just apply to R1?

R2. Each Transmission Owner shall have documented criteria to determine those of its Transmission station(s) and Transmission substation(s) within ½ mile of an applicable Transmission station or Transmission substation documented in Requirement R1 that could be impacted by a single physical attack. The criteria shall address at a minimum the following:

{C}2.1 Line of sight between multiple Transmission station(s) or Transmission substation(s) from a single location without obstruction.

If an entity has multiple fenced areas on a property site but they consider these all one station would they be non-compliant if the loss of all sites was not studied.

Finally, the identification of a physically adjacent site to an applicable station as being critical has issues if the site is not owned by the same entity as the applicable site. If mitigation measures are needed, which entity shall determine the scope of these mitigations and who should pay for them.

John Pearson - ISO New England, Inc. - 2	
Answer	No
Document Name	

Comment

R2, when combined with other requirements such as R3.3, can lead to an overly conservative outcome. In R2, stations can be grouped together due to being in close proximity to each other. Then testing is done to understand the impact of the loss of the proximity group under R3.3. By way of example, assume that there are two stations near each other, one being a very large station with numerous transmission lines connecting to it, where if tested individually, would result in significant concerns on the remaining system. The second station is a very small station, that if tested individually would

have no meaningful impact on the remaining system. When they are grouped together, the results would not be meaningfully worse than the event occurring at the large, well-interconnected station, yet the second station would get swept into needing CIP-014 upgrades simply because of its proximity, rather than the results of the test being worse. This would require customers to pay for unnecessary physical protection measures to be installed at the smaller station.

Further clarification required to stations in proximity. Understandably the standard is trying to not be too prescriptive. Is the expectation that the TO use their own discretion to determine which stations are impacted by proximity stations? And then take actions accordingly? Could the wording in the standard result in entities all performing their own methodology (from very limited to thorough) which will result in a request to form another SDT to review and be more prescriptive because they are inconsistent. Clarification is required on what is the expectation and responsibility of a TO inform a neighboring entity they station needs to be reviewed to comply with CIP-014, if it is in proximity. How much can this be enforced by one entity to another. What do we do if its not a transmitter, but a GO.

Comment
Complying with this requirement may present several challenges. (R2) We believe having a clearly defined proximity criteria of ½ mile is acceptable. It should be made clear that both sub-requirements (R2.1 and R2.2) are required to be applicable with an “and”.

(R2.1) It may be challenging to establish, document and audit what constitutes as “line of sight”. Factors such as terrain, vegetation, and existing infrastructure can obscure the view. Additionally, these factors may be point-in-time and line of sight could be obscured during initial risk assessment but visible during an Audit site visit.

(R2.2) Assessing the ease of access from roadways requires a thorough understanding of public access. Identifying all routes to a facility, especially in rural or less developed areas, can be challenging.

Also, this requirement may bring new Registered Entities that do not meet R1 into scope. Following the identification of an applicable substation per R2 owned by another Registered Entity, how will a TO ensure that necessary security measures are put in place by the adjacent TO that does not own CIP-014 R1 applicable substations?

Comment
We request clarification of the proximity requirement to be physical distance of ½ mile, not electrical distance. We request clarification of acceptable proximity obstruction exclusions such as trees, buildings, highway, etc. Clarify that if an adjacent substation is radial from the substation under study, it is not applicable.

Richard Vendetti - NextEra Energy - 5	
Answer	No
Document Name	

Comment
NextEra supports the comments provided by EEI below: EEI provides the following revisions for consideration: EEI suggests striking Requirement R2, Part 2.2. The Project Scope described in the SAR for Project 2023-06 does not include ease of access as a needed revision to CIP-014-3 but does explicitly include line-of-sight. Ease of access from a common public roadway may be an appropriate consideration in some scenarios, but it is not appropriate in all cases such as rural scenarios where a common public roadway or common roadway does not exist between stations or where an alternative such as the transmission right of way are more likely access paths. The inclusion of the ½ mile distance and line-of-sight requirement address the primary objectives in the SAR, and the “shall address at a minimum” language provides flexibility to consider additional criteria. Additionally, EEI is concerned with the inclusion of the “irrespective of ownership” language in Requirement R2 because it is not possible to compel non-registered entities, or registered entities that are not subject to CIP-014 to share the information required by the proposed Standard. While we do not have revised language to recommend, we ask the drafting team to consider ways to manage differing ownership that are scoped to registered entities who must comply with CIP-014, or to make revisions that provide flexibility by allowing the Transmission Owner to determine how to manage differing ownership as part of their criteria or methodology. EEI asks the drafting team to consider adding examples or explanations to the technical rationale describing: a. ½ mile distance – Please add a justification for selecting ½ mile as the appropriate distance. Clarify if the drafting team intended for the distance to be based on driving distance, or as the crow flies. b. Line of sight – Please clarify by adding examples of how to apply this. For example, if an entity performed site visits during the summer, line of sight could be impacted by trees/vegetation during the summer that would not impact line of sight during the winter.

Comment	
SERC appreciates the ongoing efforts to refine the CIP-014 Risk Assessment portion of the standard. As commented in previous ballots, SERC believes the removal of subrequirement 2.1 would provide additional clarity as those elements are difficult to measure and may change seasonally and over time, and create an uncertain mix of objective and subjective criteria. SERC also believes that further clarity could be added to the ½ mile threshold in R2, to clarify that ½ mile is the distance between closest substation fencelines or Elements – as some large EHV substations may have nearly ¼ mile or more of fenceline among one side.

EEI provides the following revisions for consideration:

EEI suggests striking Requirement R2, Part 2.2. The Project Scope described in the SAR for Project 2023-06 does not include ease of access as a needed revision to CIP-014-3 but does explicitly include line-of-sight. Ease of access from a common public roadway may be an appropriate consideration in some scenarios, but it is not appropriate in all cases such as rural scenarios where a common public roadway or common roadway does not exist between stations or where an alternative such as the transmission right of way are more likely access paths. The inclusion of the ½ mile distance and line-of-sight requirement address the primary objectives in the SAR, and the “shall address at a minimum” language provides flexibility to consider additional criteria.

Additionally, EEI is concerned with the inclusion of the “irrespective of ownership” language in Requirement R2 because it is not possible to compel non-registered entities, or registered entities that are not subject to CIP-014 to share the information required by the proposed Standard. While we do not have revised language to recommend, we ask the drafting team to consider ways to manage differing ownership that are scoped to registered entities who must comply with CIP-014, or to make revisions that provide flexibility by allowing the Transmission Owner to determine how to manage differing ownership as part of their criteria or methodology.

EEI asks the drafting team to consider adding examples or explanations to the technical rationale describing:

a. ½ mile distance – Please add a justification for selecting ½ mile as the appropriate distance. Clarify if the drafting team intended for the distance to be based on driving distance, or as the crow flies.

b. Line of sight – Please clarify by adding examples of how to apply this. For example, if an entity performed site visits during the summer, line of sight could be impacted by trees/vegetation during the summer that would not impact line of sight during the winter.

Lucinda Bradshaw - Lucinda Bradshaw On Behalf of: Byron Booker, Oncor Electric Delivery, 1; - Lucinda Bradshaw	
Answer	No
Document Name	

Comment

Oncor does not agree that the modifications made in CIP-014-4 Requirement R2 to address the issues identified in the SAR because the proposed sub-requirements in R2 are still ambiguous and fail to create the consistent approach in the identification of infrastructure critical to the operation of the BPS as sought with the SAR. Due to varying geographical locations of facilities and the overall flexibility to document the criteria used to determine

proximity, inconsistencies in approaches to perform risk assessments will remain. We recommend that R2.1 and R2.2 be replaced with specific and measurable criteria. For example, the Director of National Intelligence Joint Counterterrorism Assessment Team (JCAT) has published bomb threat standoff distances in which the mandatory evacuation distances for an SUV/VAN explosive threat is 400 feet. Guidelines such as these are used by Physical Security Professionals when performing the evaluation required by CIP-014-3 R6. For consistency, we recommend that a distance between 400 feet to 1000 feet be specified in CIP-014-4 R2.

Additionally, we request clarification of the proposed R2 language concerning voltage classes applicable to stations in proximity. While the proposed R2 language points to R1 stations concerning proximity, and R1 points to Attachment 1, in which lines less than 200 kV are not applicable, it is unclear that the same "less than 200 kV" exclusion applies to those facilities that are in physical proximity to facilities to which R1 is applicable. We request that R2 be clarified to state that only facilities above 200 kV and in proximity to applicable facilities under R1 are to be considered.

As revised, R2 now places the burden on a Transmission Owner ("TO") to track those Transmission stations and Transmission substations that are within ½ mile of that TO's own Transmission station or Transmission substation even if they are *owned by other parties*. Not all TOs willingly disclose the exact location of their stations or substations, and some consider the geographic locations of their stations and substations to constitute CEII. Both of these scenarios will impede a TO's ability to obtain the necessary location information. In addition, this proposed approach could present significant issues for entities that are in competition with one another, which is the case in certain areas of Texas in which multiple entities are certificated to provide service in the same geographic area or in areas containing numerous Transmission stations or Transmission substations owned by various entities in close proximity.

We also point out that the language in R2 "that could be impacted by a single physical attack" is too vague and could create significant disparities in how threat assessments are performed in accordance with R2. Under CIP-014-4 R2, each TO would be responsible for determining what an "impact" is and when it could occur. As a result, this vague requirement may create challenges when stations or substations are within the same line of sight from a single location or share access from a common roadway, but are owned by different entities. If those different TO are not aligned in how "impact" is determined and the procedures and processes implemented to ensure compliance with CIP-014-4 R2, then disagreements between those entities on whether their stations or substations could have been impacted by a single physical attack could arise. Such disagreements could make determining compliance with CIP-014-4 R2 for each of the disagreeing entities particularly difficult.

The intent of the requirement is understood and appreciated. However, the nature of the “single physical attack” needs clarification. Interpretations of this attack can range from events where elements are lost with some time delay between failures (gun shots for example) to a simultaneous loss of all	

elements (large explosion?). Clarity on the nature of the physical attack or parameters that can be applied to define the attack are needed to avoid differing interpretations of what event is to be studied and how this requirement is to be audited.

Additionally, this guidance is appropriately located in the TPL space to clarify to planning entities what type of extreme event needs to be evaluated and subsequently communicated to the Transmission Owner.

This particular requirement does not identify a need for a TO with facilities that meet the requirement to inform an adjacent TO (i.e., a TO that is a different owner) who's facilities fall under the distance identified under R2. It seems unreasonable for a TO to have to assess another TO's facilities or know if their future plans would create an impact to them due to proximity of where the facility is installed. LIPA would suggest adding language requiring TO's who identify facilities under R2 to coordinate and notify adjacent TO's in support of their own assessment. There is also a concern in the event two different entities disagree with a line of sight risk assessment. We suggest adding a common form and/or process to reconcile CIP-014 line of sight assessments / disagreements so to avert non-compliance by either entity. We would recommend issuing formal guidance on a "line of sight" and "common roadway" and how to assess those two terms.

The intent is to identify close physical proximity such that a singular event could impact both stations; other ranges are irrelevant. **Emphasize explicitly in the standard language or Guidelines and Technical Basis that this considers only a single, simultaneous attack**. Considering non-simultaneous attacks makes the number of scenarios infinite and is not feasible to analyze or protect against.

BPA recognizes a significant improvement in the language of R2, however BPA finds the proximity text is still highly subjective. BPA asks "What does the process look like when one Registered Entity brings in owners of other facilities?" BPA sees a potentially dramatic increase in modeling concerns considering multiple Facilities owned by multiple entities. BPA believes there is insufficient detail about expected actions when new Facilities are added due to proximity and recommends adding clarity to the expected actions. As an example, when a new facility is added, a study should be conducted with the option of ruling out the criticality of the new facility. Finally, BPA believes the intent of CIP-014 is changing from identifying a very small number of absolutely critical substations to requiring Registered Entities to expand their lists due to proximity.

Dwanique Spiller - Berkshire Hathaway - NV Energy - 5

Answer	Yes
Document Name	

Comment

NV Energy appreciates the addition of the ½ mile bright line criteria to remove ambiguity and subjectivity.

NV Energy requests that the SDT provide clarity on the following items:

Clarify in the rationale that the Transmission stations within a ½ mile of an applicable Transmission station is based on distance “as the crow flies” and not electrical distance.

Clarify using examples of what are acceptable proximity exclusion obstructions such as trees, buildings, highway, etc. or is this up to each individual assessment criteria?

Clarify in the rationale if an adjacent substation is radial from the substation under study, then it is not applicable. Add examples to the rationale to address the various scenarios involving a substation under study and any adjacent substations meeting the ½ mile proximity. For example: Are they faulted simultaneously or individually with or without the same damage or inoperability? Are these questions up to each individual assessment methodology?

3. Do you agree with the modifications made in CIP-014-4 with new Requirement R3 to address the issues identified in the SAR?

Kevin Conway - Western Power Pool - 4

Answer	No
Document Name	

Comment

The loss of any single substation under R3 is essentially studied as part of the TPL standards yearly. The R3 requirement should be limited to those facilities identified in R2. This avoids duplication of other standards and work, especially for smaller organizations that do not have dedicated planning staff.

Transmission Owners do not have planning staff to do steady-state and dynamic studies, that is a Transmission Planner function. Transmission Owners are responsible to build and maintain transmission assets. R3 should be focused on Transmission Planners to complete these studies and distribute them to the TO entities to implement action plans when there are negative findings. TOs should be required to provide information needed to the Transmission Planners so the studies can be relevant and accurate.

We recommend removing the word “proximity” and making it consistent with R2 wording.

We recommend the SDT to consider that planning and simulation studies (Part 3.1) are not solely be located in a physical security standard regardless of how load is lost (hurricane, fire, earthquake, physical attack, etc.)

We also recommend removing “proximity” from 3.3 and make it consistent with the rest of the standard.

A suggestion for R3.1: As currently written the terms "instability, uncontrolled separation, or Cascading within an Interconnection" are unclear within the context of a given Entity and do not provide a solid basis for the Entity to implement their program or for oversight to compare. MRO recommends that the Entity be required to define these terms in the context of the studies within their system and to identify criteria when "instability, uncontrolled separation, or Cascading within an Interconnection" occur. A suggestion for R3.2: MRO finds the term "more likely to contribute" to be vague and subjective. Consider enhancing by adding the requirement to document the rationale for the condition selections; for example justification based on historical events, and conditions identified in other studies. The proposed language for R3.3 motivates MRO's negative vote on this draft. Specifically, the use of the term "fault" opens the door to the usage of less severe faults. We recommend changing "fault" to "a fault that will cause the most severe consequences at that substation" to ensure the most serious scenario is studied. We believe the currently drafted language will reduce the effectiveness of the standard.

The ‘line-of-sight’ and ‘ease of access’ term usage concerns mentioned in comment section 2 above also applies to R3 since R3.3 refers to R2 station applicability. However, edits to R3.4.2 appear to provide more flexibility to entities and are an improvement from the previous draft version.

Comment

[R3.3] states the analysis should include a fault at the R1 applicable station and a fault at any proximate R2 station. [R3.4] states the fault simulation should assume loss of communication and protection system at the station being studied. Existing language is not clear whether one is to assume loss of protection system on only the proximate facility or both the applicable and proximate facility at the same time.

Adrian Lazo:

[R3.4.2.] Consider removal of the word “more” in requirement. “More conservative” implies the actual clearing times are known and you then assume a more conservative value. However, you would use a conservative estimate when the actual clearing times are not known.

3.4.2. Actual or more conservative estimates of clearing times shall be used unless otherwise technically substantiated.

Adrian Lazo:

[R3.2.2.] Adding unstable generators tripped from the dynamic stability study to the steady-state contingency definition would create overly conservative results. Historically, both studies have been done in parallel and not directly informed each other.

Steady-state studies typically assume constant power loads where power does not vary with changes in voltage magnitude. This is a valid assumption for steady state studies but in reality, loads do not behave this way and differs greatly from how loads are represented in dynamic studies.

For dynamic studies the composite load model (CMLD) has seen increased adoption among utilities and more accurately reflects the aggregate behavior of motors. The model includes parameters which dictate fractions of the motor load components that do not restart, even if voltage recovers above the undervoltage trip thresholds. There is currently no industry consensus on whether this fraction of non-restart able motor loss is consequential or non-consequential load loss. Entergy’s stance is that this is consequential load loss as it’s impossible to prevent and would occur even for normally cleared faults due to typical undervoltage time delays of 2-3 cycles. Consequential load loss is commonly excluded from steady-state load loss criteria.

In summary, reflecting tripped generators from the stability study to the steady-state study would only make sense if loads were also reduced by the fraction of non-restart able motor loss. This would be extremely tedious as there is currently no practical way to achieve this with the tools available to Transmission Planners. There may be other issues that may need to be considered. Removal of the “including any tripped elements from dynamic simulations” language or a written exclusion for unstable generators should be considered.

Comment	
Eversource has concerns with the phrase “other unacceptable post-event response within an Interconnection” in R3.1.1. A Transmission Planner may not know what is considered acceptable post-event response for an entire Interconnection. Direction on how to coordinate with the entire Interconnection or a minimum expectation should be provided. For example, Eversource is located in ISO New England; ISO New England may have certain acceptable frequency of 58 Hz but Pennsylvania may have a stricter 59 Hz limit, unbeknownst to the Transmission Planner. Another example would be power flow, where an acceptable amount of generation loss would not be known for an entire Interconnection, as impacts could occur outside the TP’s immediate area.

1. Please either remove 3.1.1 or merge it into 3.1. 2. The phrase "other unacceptable post-event response within an interconnection" in 3.1.1 should be limited to instability, uncontrolled separation, or Cascading. This phrase is too open ended and ill-defined. It is enough to now be adding generation loss and load loss to the instability, uncontrolled separation, and Cascading of the approved version. The SDT now has five measures of station criticality; there is no need to open the door for more. Therefore, please replace this phrase with "instability, uncontrolled separation, or cascading" or remove it entirely. 3. For clarity, we suggest expanding 3.1 to a numbered list as follows: "Technically supported thresholds and rationale for determining: 3.1.1 the amount of acceptable load loss, 3.1.2 the amount of acceptable generation loss, 3.1.3 post-event response resulting in instability having a critical impact on the operation of the interconnection, 3.1.4 uncontrolled separation, and 3.1.5 Cascading" 4. The phrase "System conditions that are more likely to contribute" in 3.2 is too open ended and ill-defined. Please replace this with "one System peak load case or System off-peak load case, whichever may be more likely to contribute..." 5. 3.2.2. Feeding dynamic outages into steady state cases will lead to significant nonconvergence issues in steady state if applied in the contingency or even if a base case is created with these outages because the appropriate timing delay cannot be reflected. If outages are applied individually and manually post-contingency this will be a significant increase in the burden of the steady state analysis.

Please consider language that is clear/specific regarding what is required, at a minimum, to meet the requirements of the standard. Having language in a requirement saying "and any additional considerations recognized as" and "that are more likely to" are too general and broad. This introduces challenges, inconsistencies, and confusion regarding what specifically must be considered in order to meet compliance with the requirement. Suggested language is provided below. Reordering of the subparts of Requirement R3 should be considered depending on the language that is ultimately chosen.

R3. Each Transmission Owner shall have a documented risk assessment methodology for evaluating the loss due to a physical attack of each applicable Transmission station(s) and Transmission substation(s) documented in Requirement R1 and Transmission substation(s) or Transmission station(s) determined to be in proximity per Requirement R2. The methodology shall include, at a minimum, the following:

3.1. Technical rationale for determining the amount of acceptable post-event load loss and generation loss.

3.2. The criteria or methodology used to identify instability, uncontrolled separation, or Cascading within an Interconnection.

3.3 Rationale for the System conditions selected for performing the studies.

3.4 For each applicable Transmission station or Transmission substation listed in accordance with Requirement R1, analysis shall include the following:

3.4.1. A Fault at the applicable Transmission station or Transmission substation and each Transmission station or Transmission substation identified in accordance with Requirement R2 as being in proximity to the applicable Transmission station or Transmission substation.

3.4.2. The removal of all Elements that the Protection System and other automatic controls are expected to disconnect for each event.

3.4.3. Steady-state simulations shall include any additional tripped Elements identified from the dynamic simulation of an event.

3.4.4. Dynamic simulations that assume the loss of communication and the Protection System at the Transmission station(s) or Transmission substation(s) shall use the following:

3.4.4.1 Delayed (remote-end) clearing times unless otherwise technically substantiated.

3.4.4.2 Actual or more conservative estimates of clearing times unless otherwise technically substantiated.

a) We recommend removing the word “proximity” from R2 and R 3.3 and making the wording consistent with the R2 wording.

b) The wording for R3.2, R3.3 and R3.4 is written a little out of context with the intent of R3, which is to develop a documented risk assessment methodology. It is recommended to consider moving R3.2, R3.3 and R3.4 to be sub-requirements of R5.

Southern Company appreciates the efforts the drafting team made to add flexibility to the simulation of a physical attack as it pertains to Requirement R3.3. However, the SAR differentiates the CIP-014 assessment from other planning assessments in that “the risk assessment requires the entire transmission station to be considered as rendered inoperable or damaged as the result of physical attack rather than just particular elements electrically connected to a single electrical disturbance.” Southern Company requests the SDT add more clarity to Requirement R3.3 to address this portion of the SAR while still maintaining some flexibility that was evident in this draft. Otherwise, we are concerned the industry will have vastly different interpretations of this requirement that lead to inconsistency in analysis and verification.

Developing steady-state and dynamic simulation criteria is a planning function and should not be required of a Transmission Owner. The sub-requirements go further into addressing what a transmission planning study should include but applies this requirement incorrectly to the Transmission owner. The intent of R3 is more appropriately applicable to the TPL body of standards. CIP-014 should reference output from a study performed in accordance with a clearly defined TPL requirement for an extreme event involving the loss of an applicable Transmission station(s) or substation(s).

CEHE supports EEI's comments for requirements 3.1 and 3.3. In addition, CEHE has concerns with planning assessments to simulate "the loss of communications and system protection" as listed in Requirement 3, part R3.4. CEHE believes it is an unnecessary burden on TPs, where now TPs are required to perform steady state assessments but also stability simulations. The loss of any single substation under R3 is already studied annually as part of TPL standards. Requirement R3, Part 3.2.2 goes beyond the scope of what is documented in the SAR by requiring additional steady-state analysis after the steady-state and dynamic simulations show acceptable system response. The SAR specifically states that "[t]o ensure that a station is effectively identified as non-critical, registered entities need to have performed both steady-state and dynamic studies" but does not go into further detail about performing another steady-state analysis that includes any tripped Elements from the dynamic simulations. We suggest striking Requirement R3, Part 3.2.2.

The referenced “System conditions that are more likely to contribute to instability, uncontrolled separation, or Cascading within an Interconnection” mentioned in R3.2 need to be clarified. In ERCOT, a TO can explain why it selected the study cases it did, but each utility can only select those cases based on its experience with its own system. If there are specific “System conditions” that need to be studied, those “System conditions” should be specified and explained in R3.2.

EEI proposes the following revisions for consideration:

The term "proximity" is not used in Requirement R2. EEI suggests removing it from Requirement R3 and its sub parts.

R3. Each Transmission Owner shall have a documented risk assessment methodology, including criteria for steady-state and dynamic simulations, for evaluating the loss due to a physical attack of each applicable Transmission station(s) and Transmission substation(s) documented in Requirement R1 and Transmission substation(s) or Transmission station(s) determined per Requirement R2. The methodology shall include, at a minimum, the following:

Requirement R3, Parts 3.1 and 3.1.1 include duplicative concepts that could lead to confusion implementing and/or documenting the requirement parts. As an example, Requirement R3 requires the Transmission Owner to have a documented risk assessment methodology, including criteria for steady-state and dynamic simulations. Requirement R3, Part 3.1 requires the methodology to include technically supported thresholds and rationale, and Part 3.1.1 restates the requirement for the technical rationale to include steady-state and dynamic system response to events. EEI suggests consolidating the requirement parts as written below:

3.1 Technically supported thresholds and rationale for determining the amount of acceptable load loss, the amount of acceptable generation loss post-event response, and any additional considerations recognized as resulting in instability, uncontrolled separation, or Cascading within an Interconnection.

Requirement R3, Part 3.2.2 goes beyond the scope of what is documented in the SAR by requiring additional steady-state analysis after the steady-state and dynamic simulations show acceptable system response. The SAR specifically states that "[t]o ensure that a station is effectively identified as non-critical, registered entities need to have performed both steady-state and dynamic studies" but does not go into further detail about performing another steady-state analysis that includes any tripped Elements from the dynamic simulations. We suggest striking Requirement R3, Part 3.2.2.

Requirement R3, Part 3.3 could be further clarified and reference to proximity should be removed in favor the reference to R2, we suggest the following language:

3.3 For each applicable Transmission station or Transmission substation listed in accordance with Requirement R1, analysis shall include a Fault **in the simulation** at the applicable Transmission station or Transmission substation and **then at** each Transmission station or Transmission substation identified in accordance with Requirement R2.

Requirement R3, Part 3.4 is not clear as written. If the intention of the drafting team is for 3.4 to require fault simulations that assume the loss of communication and Protection System at all of the Transmission station(s) or Transmission substation(s) studied under Requirements R3, Parts 3.2 and 3.3 simultaneously, we suggest the following revision:

3.4. Fault simulations that assume the loss of communication and Protection System at **all of** the Transmission station(s) or Transmission substation(s) studied under Requirement R3, Parts 3.2 and 3.3.

EEI appreciates that drafting team's revision to Requirement R3, Part 3.4.2 to provide flexibility in the clearing times used, however, by stating "Actual or more conservative" entities will still need to calculate the actual clearing times in order to validate that the estimates are more conservative. We suggest:

3.4.2. Actual or conservative estimates of clearing times shall be used unless otherwise technically substantiated.

Tacoma Power supports the changes. However, there does not appear to be an existing requirement within TPL-008, TPL-001, or MOD-032 for a TO with a non-applicable substation to provide sufficient detail about backup relaying schemes to an adjacent TO in order to fulfill R3.2.1. We recommend the standard drafting team ensure there is adequate access to relaying information via a request chain from the TO to PC to adjacent PC to TO.

Dave Krueger - SERC Reliability Corporation - 10	
Answer	No
Document Name	
Comment	
SERC appreciates the ongoing efforts to refine the CIP-014 Risk Assessment portion of the standard. SERC believes the elimination of the specific details in previous requirements 3.4 and 3.5 and the use of the single word 'fault', that the standard has drifted from having clarity and consistency in the requirements of how such extreme events are simulated across different utilities, contrary to the specificity mentioned in SAR Scope item 3 and without explanation in the Technical Rationale for the change. There is also no visible consideration or measurement of the reliability risks of excluding certain fault types from these forward-looking studies, nor an ongoing mechanism in R3.3 for historic analysis of faults as proposed by some other commenters.

NextEra supports the comments provided by EEI below:

EEI proposes the following revisions for consideration:

The term “proximity” is not used in Requirement R2. EEI suggests removing it from Requirement R3 and its sub parts.

R3. Each Transmission Owner shall have a documented risk assessment methodology, including criteria for steady-state and dynamic simulations, for evaluating the loss due to a physical attack of each applicable Transmission station(s) and Transmission substation(s) documented in Requirement R1 and Transmission substation(s) or Transmission station(s) determined to be in proximity per Requirement R2. The methodology shall include, at a minimum, the following:

Requirement R3, Parts 3.1 and 3.1.1 include duplicative concepts that could lead to confusion implementing and/or documenting the requirement parts. As an example, Requirement R3 requires the Transmission Owner to have a documented risk assessment methodology, including criteria for steady-state and dynamic simulations. Requirement R3, Part 3.1 requires the methodology to include technically supported thresholds and rationale, and Part 3.1.1 restates the requirement for the technical rationale to include steady-state and dynamic system response to events. EEI suggests consolidating the requirement parts as written below:

1.1 Technically supported thresholds and rationale for determining the amount of acceptable load loss, the amount of acceptable generation loss post-event response, and any additional considerations recognized as resulting in instability, uncontrolled separation, or Cascading within an Interconnection. The technical rationale shall include:

1.1.1 Steady-state and dynamic system response to events that could lead to load loss, generation loss, and other unacceptable post-event response

Requirement R3, Part 3.2.2 goes beyond the scope of what is documented in the SAR by requiring additional steady-state analysis after the steady-state and dynamic simulations show acceptable system response. The SAR specifically states that “[t]o ensure that a station is effectively identified as non-critical, registered entities need to have performed both steady-state and dynamic studies” but does not go into further detail about performing another steady-state analysis that includes any tripped Elements from the dynamic simulations. We suggest striking Requirement R3, Part 3.2.2.

Requirement R3, Part 3.3 could be further clarified and reference to proximity should be removed in favor the reference to R2, we suggest the following language:

3.3 For each applicable Transmission station or Transmission substation listed in accordance with Requirement R1, analysis shall include a Fault **in the simulation** at the applicable Transmission station or Transmission substation and **then at** each Transmission station or Transmission substation identified in accordance with Requirement R2 as being in proximity to the applicable Transmission station or Transmission substation.

Requirement R3, Part 3.4 is not clear as written. If the intention of the drafting team is for 3.4 to require fault simulations that assume the loss of communication and Protection System at all of the Transmission station(s) or Transmission substation(s) studied under Requirements R3, Parts 3.2 and 3.3 simultaneously, we suggest the following revision:

3.4. Fault simulations that assume the loss of communication and Protection System at **all of** the Transmission station(s) or Transmission substation(s) studied under Requirement R3, Parts 3.2 and 3.3.

EEI appreciates that drafting team’s revision to Requirement R3, Part 3.4.2 to provide flexibility in the clearing times used, however, by stating “Actual or more conservative” entities will still need to calculate the actual clearing times in order to validate that the estimates are more conservative. We suggest:

3.4.2. Actual or more conservative estimates of clearing times shall be used unless otherwise technically substantiated.

Comment
Please provide more specificity around the clearing times referenced in R3.4. The phrase “more conservative estimates” is vague as it opens the door to different interpretations by various entities. A specific timeframe should be specified in cycles to clarify the intent of the Standard. There are two issues to consider, both being identified during a compliance audit. One issue considers loss of communications at the primary substation, and the other considers any adjacent or proximate substations. First, is the simulation intended to have a communication outage prior to a fault or simultaneous with the fault, and if not simultaneous how far in advance of the fault is the communications outage expected to occur (this issue was a point of contention during an audit)? Please clarify the language of the Standard regarding loss of communications for protection schemes and the timing of loss of communications between multiple substations. Second, regarding timing of loss of communications at adjacent substations, if an assessment methodology allows for pilot schemes to trip high speed without communications such as DCB lack of blocking signal or DCUB unblocking schemes when the guard signal is lost during the trip window allowing a highspeed trip this is technically substantiated. Additionally, the assumption of a simultaneous fault and/or loss of communications on each element of two adjacent substations, potentially up to ½ mile apart, seems impossible to technically justify and should not be required for the risk assessment. Please reconcile the phrase “more likely to contribute” in Requirement 3.2 with the phrase in 3.4, “technically substantiated”. Using the terminology “more likely” seems to invalidate any conditions that are “technically substantiated”, allowing nothing less than the instantaneous complete destruction of multiple substations. This is impractical. The NERC report on CIP-014 noted that NERC finds that the inconsistent approach to performing the risk assessment is largely due to a lack of specificity in the requirement language as to the nature and parameters of the risk assessment. Is it more likely all systems are inoperable or more likely just a few systems are inoperable? Several scenarios could exist which seems subjective and will still result in inconsistent approaches. Please add examples of various scenarios to address these issues.

A 36month frequency of this standard has a shorter time cycle than some entities broader system studies which determine cascading, uncontrolled separations etc… in many regions the RC or ISOs perform these studies and provide results to the TO for use in CIP-014. These entities must also have to adjust their study cycle (which is very onerous) OR suggestion is to add a statement in the standard that allows the TO use their discretion with RC to use the most recent studies available.

Comment

ITC proposes the following revisions for consideration:

The term “proximity” is not used in Requirement R2. ITC suggests removing it from Requirement R3 and its sub parts.

R3. Each Transmission Owner shall have a documented risk assessment methodology, including criteria for steady-state and dynamic simulations, for evaluating the loss due to a physical attack of each applicable Transmission station(s) and Transmission substation(s) documented in Requirement R1 and Transmission substation(s) or Transmission station(s) determined to be in proximity per Requirement R2. The methodology shall include, at a minimum, the following:

Requirement R3, Parts 3.1 and 3.1.1 include duplicative concepts that could lead to confusion implementing and/or documenting the requirement parts. As an example, Requirement R3 requires the Transmission Owner to have a documented risk assessment methodology, including criteria for steady-state and dynamic simulations. Requirement R3, Part 3.1 requires the methodology to include technically supported thresholds and rationale, and Part 3.1.1 restates the requirement for the technical rationale to include steady-state and dynamic system response to events. ITC suggests consolidating the requirement parts as written below:

{C}a. {C}Thresholds for determining the amount of acceptable load loss, the amount of acceptable generation loss, and post-event response recognized as resulting in instability, uncontrolled separation, or Cascading within an Interconnection. The technical rationale shall include:

{C} i. Steady-state and dynamic system response to events that could lead to load loss, generation loss, and other unacceptable post-event response

Requirement R3.2 ITC recommends that the phrase (that are more likely to contribute to) be deleted from the requirement. This is subjective and could lead to violations if your ERO disagreed with what you determined was not a more likely scenario as appropriate for your studies.

Requirement R3, Part 3.2.2 goes beyond the scope of what is documented in the SAR by requiring additional steady-state analysis after the steady-state and dynamic simulations show acceptable system response. The SAR specifically states that “[t]o ensure that a station is effectively identified as non-critical, registered entities need to have performed both steady-state and dynamic studies” but does not go into further detail about performing another steady-state analysis that includes any tripped Elements from the dynamic simulations. We recommend striking Requirement R3, Part 3.2.2.

Requirement R3, Part 3.3 could be further clarified and reference to proximity should be removed in favor the reference to R2, we suggest the following language:

3.3 For each applicable Transmission station or Transmission substation listed in accordance with Requirement R1, analysis shall include a Fault **in the simulation** at both the applicable Transmission station or Transmission substation and **at** each associated Transmission station or Transmission substation identified in accordance with Requirement R2 as being in proximity to the applicable Transmission station or Transmission substation.

Requirement R3, Part 3.4 is not clear as written. If the intention of the drafting team is for 3.4 to require fault simulations that assume the loss of communication and Protection System at all of the Transmission station(s) or Transmission substation(s) studied under Requirements R3, Parts 3.2 and 3.3 simultaneously, we suggest the following revision:

3.4. Fault simulations that assume the loss of communication and Protection System at **all of** the Transmission station(s) or Transmission substation(s) studied under Requirement R3, Parts 3.2 and 3.3. The TO shall identify the clearing times utilized for the required studies.

ITC recommends that both 3.4.1 and 3.4.2 are too prescriptive. An estimate of clearing times is typically used for dynamics studies to alleviate the administrative burden of identifying the expected clearing times for each specific scenario being analyzed.

ITC appreciates that drafting team’s revision to Requirement R3, Part 3.4.2 to provide flexibility in the clearing times used, however, by stating “Actual or more conservative” entities will still need to calculate the actual clearing times in order to validate that the estimates used were more conservative. We suggest the following if the DT believes this is essential:

3.4.2. Actual or more conservative estimates of clearing times shall be used.

NIPSCO agrees with EEI comments:

"The term "proximity" is not used in Requirement R2. EEI suggests removing it from Requirement R3 and its sub parts.

R3. Each Transmission Owner shall have a documented risk assessment methodology, including criteria for steady-state and dynamic simulations, for evaluating the loss due to a physical attack of each

applicable Transmission station(s) and Transmission substation(s) documented in Requirement R1 and Transmission substation(s) or Transmission station(s) determined per Requirement R2. The methodology shall include, at a minimum, the following:

Requirement R3, Parts 3.1 and 3.1.1 include duplicative concepts that could lead to confusion implementing and/or documenting the requirement parts. As an example, Requirement R3 requires the Transmission Owner to have a documented risk assessment methodology, including criteria for steady-state and dynamic simulations. Requirement R3, Part 3.1 requires the methodology to include technically supported thresholds and rationale, and Part 3.1.1 restates the requirement for the technical rationale to include steady-state and dynamic system response to events. EEI suggests consolidating the requirement parts as written below:

3.1 Technically supported thresholds and rationale for determining the amount of acceptable load loss, the amount of acceptable generation loss post-event response, and any additional considerations recognized as resulting in instability, uncontrolled separation, or Cascading within an Interconnection.

Requirement R3, Part 3.2.2 goes beyond the scope of what is documented in the SAR by requiring additional steady-state analysis after the steady-state and dynamic simulations show acceptable system response. The SAR specifically states that "[t]o ensure that a station is effectively identified as non-critical, registered entities need to have performed both steady-state and dynamic studies" but does not go into further detail about performing another steady-state analysis that includes any tripped Elements from the dynamic simulations. We suggest striking Requirement R3, Part 3.2.2.

Requirement R3, Part 3.3 could be further clarified and reference to proximity should be removed in favor the reference to R2, we suggest the following language:

*3.3 For each applicable Transmission station or Transmission substation listed in accordance with Requirement R1, analysis shall include a Fault **in the simulation** at the applicable Transmission station or Transmission substation and **then at** each Transmission station or Transmission substation identified in accordance with Requirement R2.*

Requirement R3, Part 3.4 is not clear as written. If the intention of the drafting team is for 3.4 to require fault simulations that assume the loss of communication and Protection System at all of the Transmission station(s) or Transmission substation(s) studied under Requirements R3, Parts 3.2 and 3.3 simultaneously, we suggest the following revision:

*3.4. Fault simulations that assume the loss of communication and Protection System at **all of** the Transmission station(s) or Transmission substation(s) studied under Requirement R3, Parts 3.2 and 3.3.*

EEI appreciates that drafting team's revision to Requirement R3, Part 3.4.2 to provide flexibility in the clearing times used, however, by stating "Actual or more conservative" entities will still need to calculate the actual clearing times in order to validate that the estimates are more conservative. We suggest:

3.4.2. Actual or conservative estimates of clearing times shall be used unless otherwise technically substantiated."

NIPSCO agrees with NV Energy comments:

The open-ended nature of "physical attack" results in very different interpretations of severity and subsequent protection system fault modeling results. This could be especially true depending on substation locations and inherent risk differences throughout the country. Clarify if the decisions to the questions above are left up to each company and their own assessment methodology?

Add examples to the rationale to address the various scenarios involving a substation under study and any adjacent substations meeting the ½ mile proximity. For example: Are they faulted simultaneously or individually with or without the same damage or inoperability? Are these questions up to each individual assessment methodology?

The standard needs to be prescriptive on amount of load loss/generation loss that may impact an Interconnection (i.e. result in instability, uncontrolled separation or Cascading within an Interconnection). Sometimes loss of large spot loads (data centers etc.) may not represent a general wide area outage in an interconnection; and number of customers or area distribution substations may provide better representation of a wide area outage/blackout.

LG&E/KU supports the modifications in Requirement R3, but notes three non-substantive corrections. First, Requirement R3 Part 3.1.1 is redundant with Part 3.1 and could be removed. Second, “Protection System” in Requirement R3 Part 3.4 should be “Protection Systems”. Third, Requirement R3 Part 3.4 incorrectly states “… studied under Requirement R3, Parts 3.2 and 3.3.” It should only reference Part 3.3 since all Faults are now described in the same Part.

Comment	
Exelon agrees R3 addresses issues identified in the SAR, however, the term “Fault” is overly broad in the Draft 2 revision and does not provide the clarity directed by the SAR. Exelon prefers the Draft 1 version of R3 with the faults specified as at the highest voltage level, and with the fault magnitudes provided as specific fault types. The Draft 1 version of R3 provided criteria that created the “consistency of approach” the SAR is intended to achieve. Submitted on behalf of Exelon - Segments 1 & 3

NV Energy appreciates moving most of the granular specifications of R3.1 to the Technical Rationale. NV Energy would prefer that these were also removed from the Technical Rationale due to concern that an auditor may solely rely upon the Technical Rationale in interpreting R3.1 That could lead to circumstances in which an entity is held to compliance with the Technical Rationale rather than the actual language the of requirement."

Requirement R3.2 states "Steady-state and dynamic simulations shall be performed under System conditions that are **more likely** to contribute to instability, uncontrolled separation, or Cascading within an Interconnection". Please reconcile the statement in 3.2 how "more likely to contribute to instability, uncontrolled separation, or Cascading" clarifies "technically substantiated" in requirement 3.4. Using terminology such as "more likely" seems to remove the possibility to technically substantiate anything less than complete destruction of multiple substations. This seems impractical.

The NERC report on CIP-014 noted that NERC finds that the inconsistent approach to performing the risk assessment is largely due to a lack of specificity in the requirement language as to the nature and parameters of the risk assessment. For example, is the protection system "rendered inoperable" where no substation protection system would operate or instead just damaged where the secondary protection is inoperable but the primary still operates for the substation? Is it more likely all systems are inoperable or more likely just a few systems are inoperable? A huge number of scenarios could exist which seems very subjective and will still result in inconsistent approaches. Clarify if the decisions to these questions are left up to each company and their own assessment methodology?

Note: remove or damaged due to being redundant due to "rendered inoperable"

If an assessment methodology allows for pilot schemes to trip high speed without communications such as DCB lack of blocking signal or DCUB unblocking schemes when the guard signal is lost during the trip window allowing a highspeed trip, is this technically substantiated? Add some discussion in the technical rationale regarding loss of communications for protection schemes.

The new R3 is acceptable, but we have a couple remaining concerns:

I'm still not sure how to determine "technically supported thresholds" for gen and load loss, outside of what results in " instability, uncontrolled separation, or Cascading." Are these intended to be seperate determinations?

In reference to 3.4 specifically, I appreciate the requirement being less prescriptive about how we run the study, but we have experienced disagreement with regulators about what type of physical attack we are supposed to simulating (i.e. "smoking crater" vs something more realistic). It would be nice to have some guidance here to help clear up the ambiguity so that we can choose the appropriate contingencies to run.

Texas RE is concerned the proposed Requirement Part 3.3 language does not specify the type of fault conditions (line-to-ground fault or three-phase fault) criteria that needs to be studied. Texas RE is also concerned with the use of the NERC Glossary definition of Fault, as it does not include line-to-ground faults or three-phase faults. Not defining the type of fault leaves it open for inconsistent applicability by the Transmission Owners. The drafting team should consider specifying the fault type to be used in the simulations to capture the highest risk conditions. At minimum, 'Fault' should not be capitalized, but a clear definition of the required "fault" conditions to be studied should be developed in the standard itself to avoid inconsistency in the compliance and subsequent auditing process.

Duke Energy requests additional clarification on “owned by multiple Transmission Owners” and requests that the team clarify that merely having elements at a station or substation with differing ownership would not make a station or substation jointly owned. If the Drafting team does intend thatelements from another Transmission Owner could classify a station or substation as “owned by multiple Transmission Owners”, what is the mechanism to ensure coordination occurs? Particularly if the visiting Transmission Owner does not have compliance in scope for CIP-014.

Comment

The inclusion of R4 is not identified as needed in the NERC CIP-014 Report nor in the SAR for the project. The inclusion of this requirement leads to a number of questions that have not been clarified. If For an entity that has a station with multiple voltage areas including some that are not applicable to CIP-014, how would an entity determine if this would be considered a joint station. If the second TO only has facilities that would not be applicable to CIP-014 within the substation, would they have to identify joint responsibilities for these sites.

If this requirement is retained, ITC believes it would be prudent to only consider the CIP-014 applicable voltages in the station to determine if it would be a joint station.

Comment	
SERC appreciates the ongoing efforts to refine the CIP-014 Risk Assessment portion of the standard. SERC believes the coordination efforts in R4 should include R3 as well as R5, so that consistency and clarity in study results between multiple entity owners is maintained. In the case where all owners share the same R3 and R4 thresholds (such as in an RTO/ISO), only an acknowledgement of such would be needed to affirm consistency.

Comment

As written, the revised R4 appears to indicate that each TO that owns a part of a Transmission station or a Transmission substation identified pursuant to the assessment required in R1 should coordinate with those other TOs to determine their “individual and joint responsibilities” for performing any required risk assessments. It appears that the subject TOs could agree that each TO can prepare its own risk assessment of the subject station. If that is not what the SDT intended, then R4 needs to be clarified to affirmatively state more clearly what is intended.

It also appears that R4 does not require that each of the TOs that owns a part of a Transmission station or a Transmission substation must use the same methodology in preparing its required risk assessment. Again, if that is not what the SDT intended, then R4 needs to be clarified to make any methodological requirements clear.

Fundamentally, there are two inherent assumptions in the revised R4: (1) that it will always be possible for a TO to coordinate with all other TOs owning a Transmission station or a Transmission substation; and (2) that those TOs will always be able to agree on the responsibilities for preparing any required risk assessments. Unfortunately, that will likely not always be the case. To address this possibility, R4 should be revised to allow a TO to perform its own required risk assessment if the TOs cannot agree on the responsibilities for performing the required risk assessments.

Is the 36-month periodicity with regard to the coordination, the risk assessment, or both? We suggest adding that only changes in responsibilities of Joint substation or stations should be documented once every 36 months or attestation that no changes occurred in responsibilities during the 36-month period. At scale, these substation and stations can be an administrative burden due to the number of agreements an entity may have, and an overarching document may be a better solution for management of these agreements. We are unsure of the intended goal or end value of the requirement and would like clarification

Does the outcome of the risk assessment need to be agreed to by both parties of a Joint substation or station? Additional clarification on what is expected for the outcome of the coordinated risk assessment should be clarified.

Transmission Owners who are identified in R1 do not have to be coordinate if they do not have facilities as identified in Attachment 1. The reference to R5 should be deleted and language such as "...their individual and joint responsibilities for performing any required risk assessments per this standard."

Has the drafting team considered where two substations are in close proximity together and where a single event can affect both substations: however, one is owned by an applicable entity under R1, and the other is not?

5. Do you agree with the modifications made in CIP-014-4 with adding Requirement R5 to address the issues identified in the SAR?	
Kevin Conway - Western Power Pool - 4	
Answer	No
Document Name	
Comment	
This goes back to R1 where ALL TOPs should be required to meet R1 (every 36 months), and only those who have Facilities that meet Attachment 1 will be responsible for meeting compliance to the rest of the Standard. As written, entities may find they are exempt from the proposed standard initially, and there is no requirement for them to re-evaluate their applicability.

It is recommended to also update the R5 VRF to reference the Near-Term Transmission Planning Horizon instead of the Long-Term Transmission Planning Horizon. The R5 VRF Time Horizon still states it applies to 'Long-term Planning Horizon', whereas the NERC Glossary of Terms defines the 'Near-Term Planning Horizon' as the window covering year 1 through 5. This requirement references 'at least once every 36 calendar months', so it is recommended that the R5 VRF Time Horizon language is updated to reference the 'Near-Term Transmission Planning Horizon'. Otherwise, the changes are generally good.

Was "previously" meant to be struck in R5.1? The intent of this section was believed to be that if a station was previously found to be impactful, it does not have to be restudied; is that not the case? Requirement R5.3 should be added stating something similar to "Multiple Transmission Owners of stations within proximity as determined in R2 shall share the results of their analyses related to the stations within proximity with all the other Transmission Owners of the stations within proximity."

MPC strongly disagrees with the use of a 36-month timeframe for utilities who have not previously identified any substations as critical as it is both outside the scope of the SAR and will lead to increased study costs with little or no benefit to BES reliability. During the 6/7/24 NERC webinar for Draft 1, the SDT stated the goal of changing the risk assessment timeframe to 36 months was to align the CIP-014 risk assessment with the model build timeframe of another standard. Later, MPC requested clarification on which standard the SDT is aligning with during the 10/17/24 industry webinar, and the SDT indicated it aligns with the 12-month timeframe of the TPL-001 standard. The CIP-014 analysis does not depend on the models built for TPL-001, and MPC believes changing the CIP-014 study timing to align with the TPL-001 model build process provides no additional reliability benefit to the BES for entities that have not identified critical stations/substations. Furthermore, the existing 60-month timeframe can also align with the 12-month model build timeframe of the TPL-001 standard. Stations and substations planned to be in service within 24 months of the CIP-014 risk assessment are already required to be included under R1 of CIP-014-3 (or within 36 months with proposed CIP-014-4 R1), which suggests that decreasing the risk assessment timeframe from 60 months to 36 months is very unlikely to identify stations or substations that would not already be identified under CIP-014 R1. Moreover, the very slow pace of construction of new electrical infrastructure due to increased equipment lead times, supply chain constraints, and labor shortages makes it highly unlikely that modifications to an existing non-critical Transmission station or substation could be planned, designed, and constructed such that it would be elevated to a critical station/substation within 36 months. It is equally unlikely that a newly constructed CIP-014 critical substation would be completed within this timeframe. For utilities who have previously not identified substations as critical, reducing the risk assessment timeframe from 60 months to 36 months will result in increased costs due to more frequent risk assessments, with the more frequent assessments having no reliability benefit as they have little to no chance of identifying more Transmission stations or substations as CIP-014 critical that would not already have been under the CIP-014-3 Standard.

Comment	
Southern Company agrees with the intent of this requirement. However, as it is presently written, the requirement only applies to jointly owned Transmission station(s) and Transmission substation(s). Consider the below modifications: R5. At least once every 36 calendar months, each Transmission Owner shall perform a risk assessment to identify Transmission station(s) and Transmission substation(s) that if rendered inoperable or damaged as a result of a physical attack could result in instability, uncontrolled separation, or Cascading within an Interconnection, using the methodology established in Requirement R3 including any Transmission station(s) and Transmission substation(s) identified in accordance with documentation established per Requirements R1, R2, and R4.

Comment	
Does not provide an option for de-classification of a Transmission Substation from critical to non-critical. Additional projects could provide more resiliency to the BES that could result in a substation no longer causing instability, uncontrolled separation, or Cascading within an Interconnection when rendered inoperable or damaged as a result of a physical attack. Language R5.1 does not provide additional value and is confusing. How many assessments can be skipped for a specific site identified that causes instability, uncontrolled separation, or Cascading within an Interconnection when rendered inoperable or damaged as a result of a physical attack? The current language implies that a site that is initially identified as causing instability, uncontrolled separation, or Cascading within an Interconnection never needs to be re-evaluated in any future risk assessments.

Jamison Cawley - Nebraska Public Power District - 1

Answer	No
Document Name	

Comment

We request clarification of the phrase "rendered inoperable or damaged". There seems to be an incongruity between a facility that is simply damaged and one that is rendered inoperable. The phrase "or damaged" indicates a less severe impact than "rendered inoperable", for instance just a portion of the substation may be damaged. We request definitions for "inoperable" and "damaged", as recommended by the NERC 2023 CIP-014 evaluation report, to provide clear intent of the risk assessment.

Please explain the technical basis for the change from 60 months (with no previous applicable substations identified) to 36 months for re-performance of the risk assessment. If no technical basis exists, we request the period be returned to the original 60 months. Reducing the period to 36 months will place additional burdens on Transmission Planners, which pulls resources from activities that are also important to grid reliability. Further, most significant EHV expansion projects which would alter the previous base case assumptions do not occur every 36 months and are more in line with 60-month construction periods.

BPA has identified that the SAR does not include content for when a problem needs resolution when there is Joint Ownership of a substation. The SAR's purpose only states "Clarify how to account for adjacent Transmission stations or Transmission substations of differing ownership as well as for those Transmission stations or Transmission substations within line-of-sight to each other." BPA recommends adding clarification for problem resolution to account for unforeseen circumstances.

For the Drafting Teams consideration: Clarification is needed regarding stations and substations identified in previous risk assessments as causing instability, uncontrolled separation, or Cascading within an interconnection when rendered inoperable or damaged as a result of a physical attack if those substations will need to be studied is subsequent risk assessments. In other words, once a station or substation has been identified as 'critical' can the TO assume it will continue to be 'critical' without having to assess it again?

LG&E/KU supports the modifications in Requirement R5, but suggests two non-substantive clarifications.

First, in the main body of Requirement R5 clarify, "… using the methodology established in Requirement R3 [*including any Transmission station(s) and Transmission substation(s) identified*] **and, where appropriate,** in accordance with **the responsibilities** document[*ation establish*]ed per Requirement R4." As currently written, this sentence implies additional Transmission station(s) and Transmission substation(s) are identified in Requirement R4. However, Requirement R4 only establishes responsibilities for stations with multiple owners. The suggested clarification sharpens the connection between Requirements R4 and R5.

Second, in Requirement R5 Part 5.2 clarify, "… identified **as causing instability, uncontrolled separation, or Cascading within an Interconnection** in the Requirement R5 risk assessment." This Part previously said identified as "critical". Removing the undefined "critical" is a good change, but "identified" does not convey the same meaning on its own.

EEI asks the drafting team to consider adding clarity to the technical rationale describing what is intended by Requirement R5, Part 5.1 that states “A Transmission station or Transmission substation identified in dynamic or steady-state simulations as causing instability, uncontrolled separation, or Cascading within an Interconnection when rendered inoperable or damaged as a result of a physical attack does not require any additional simulations during the current risk assessment.” It is not clear if the intention is for those stations and substations to be reassessed every 36 calendar months if they’ve already been identified, or if keeping them on the list for applying CIP-014 protections is sufficient after their initial assessment.

NV Energy appreciates the drafting team reverting to the “identified” language of previous versions for continuity with the remainder of the requirements that remain unchanged. Can the drafting team provide more clarity on what is meant by “if rendered inoperable or damaged as a result of a physical attack”? Rendered inoperable appears to indicate a more severe impact where “or damaged” seems much less severe such as just a portion of a substation system. It is also not clear if rendered inoperable or damaged refers to the substation transmission system or the control and protection systems or both. This is a fundamental source of confusion as to how protection system functions are impacted and how/where faults should be applied for these studies that will be acceptable to auditors. For example, are faults applied simultaneously to different voltage levels, or only at the local substation under	

attack, or all included elements one at a time? This would seem to depend on the type of attack and what is rendered inoperable or damaged. The NERC 2023 CIP-014 evaluation report noted that a criterion should also include defining “inoperable” or “damaged” substations such that the intent of the risk assessment is clear.

It is also unclear if the “physical attack” is on the primary transmission system such as occurring outside the fence remote to the substation or internal on the control house systems inside the substation, or if it is on all systems. An attack could mean there are explosives involved, gunshots remote from the substation, or invasive personnel onsite. Which of these are more likely? There should be more industry agreement on how an attack impacts a substation and the primary system and underlying control and protection systems. The open-ended nature of “physical attack” results in very different interpretations of severity and subsequent protection system fault modeling results. This could be especially true depending on substation locations and inherent risk differences throughout the country. Clarify if the decisions to the questions above are left up to each company and their own assessment methodology?

Add examples to the rationale to address the various scenarios involving a substation under study and any adjacent substations meeting the ½ mile proximity. For example: Are they faulted simultaneously or individually with or without the same damage or inoperability? Are these questions up to each individual assessment methodology?

Comment	
NextEra supports the comments provided by EEI below: EEI asks the drafting team to consider adding clarity to the technical rationale describing what is intended by Requirement R5, Part 5.1 that states “A Transmission station or Transmission substation identified in dynamic or steady-state simulations as causing instability, uncontrolled separation, or Cascading within an Interconnection when rendered inoperable or damaged as a result of a physical attack does not require any additional simulations during the current risk assessment.” It is not clear if the intention is for those stations and substations to be reassessed every 36 calendar months if they’ve already been identified, or if keeping them on the list for applying CIP-014 protections is sufficient after their initial assessment.

6. Do you agree with the Implementation Plan for CIP-014-4?

Bob Cardle - Bob Cardle On Behalf of: Marco Rios, Pacific Gas and Electric Company, 3, 1, 5; Sandra Ellis, Pacific Gas and Electric Company, 3, 1, 5; Tyler Brun, Pacific Gas and Electric Company, 3, 1, 5; - Bob Cardle

Answer	No
Document Name	

Comment

The CIP-014-4 standard introduces a significant change by requiring the inclusion of stations within a 1/2-mile line of sight or easily accessible from a common roadway. However, the standard lacks clear guidelines for selecting stations. This could lead to inconsistencies and challenges in implementation, as different Transmission Owners and Transmission Operators may interpret and apply the criteria differently.

To improve clarity and ensure consistent implementation, the standard should provide more detailed guidance on the selection of stations, including specific criteria for evaluating lines of sight and ease of access from common roadways. This would help Transmission Owners and Transmission Operators to better understand the requirements and apply them consistently, ensuring the reliability and security of the electrical grid.

NIPSCO agrees with Southern CO:

It potentially could be excessively burdensome on a Transmission Owner (TO) to be required to perform a new risk assessment study within 24 months of the effective implementation date of the revised CIP-014-4 standard. Additionally, limited resources may be available to complete a verification within 90 days of the effective date per Requirement R6.

For example, given the current CIP-014-3 R1.1 30 calendar month subsequent risk assessment requirement schedule for a TO which has substations identified under R1, the TO may currently be required to complete a subsequent R1 study as of September 30, 2025.

If the revised standard has an effective implementation date of October 1, 2025, the TO would be required to complete a new R1 study within 24 months of October 1, 2025. A more effective and efficient

methodology is a phased approach based on the TO's completion date of the TO's most recent R1.1 subsequent risk assessment study.

Proposed Language: Each TO shall conduct its first assessment under CIP-014-4 within 36 calendar months after the effective date or within 36 calendar months after their last assessment under CIP-014-3, whichever occurs later.

For entities with facilities spread over many states that were constructed at significantly different times, the additional work included in this version will make it more complicated to complete by the effective date. Additional constraints with completing the required work will occur depending on the timing of their compliance with the existing version. An additional 6 months, or 30 months, would make this more feasible.

Recommending making CIP-014-4 effective 12 months after applicable government authority approval. The first assessment under CIP-014-4 shall be completed at the earlier of the following:	

- Within 30 calendar months of its previous risk assessment under CIP-014-3 if it identified one or more transmission stations or transmission substations that if rendered inoperable or damaged could result in instability, uncontrolled separation, or cascading within its interconnection in its last CIP-014-3 risk assessment;
- Within 60 calendar months of its previous risk assessment under CIP-014-3 if it did not identify any transmission stations or transmission substations that if rendered inoperable or damaged could result in instability, uncontrolled separation, or cascading within its interconnection in its last CIP-014-3 risk assessment;
- Within 24 months of the effective date of CIP-014-4.

FirstEnergy sees the current version requiring a 2-year cycle. With the implementation of CIP-014-4, has Drafting Team considered a 5-year gap that could result in the implementation of the newest version? FirstEnergy also supports EEI Comments which state: EEI is concerned that the implementation plan requires the initial risk assessment required by CIP-014-4 to be completed on or before the effective date of the Standard and does not provide a phased in approach. The modifications required by the proposed CIP-014-4 include new processes to be established prior to initiating new risk assessments. The proposed 24-month timeline is not reasonable for completing the initial risk assessment. EEI suggests allowing the initiation of CIP-014-4 risk assessments to occur on or before the effective date of the standard to allow additional time to modify programs.

Leshel Hutchings - AEP - 3	
Answer	No
Document Name	
Comment	
The proposed implementation plan is 24 months. This means some Transmission Owners may have insufficient time, less than 36 months, to complete their next assessment based on the new standard. Example: a TO with an existing compliance deadline at the end of this year may fall under the shortened timeline. For large TOs, the existing applicability scoring, case prep, steady state and stability analysis, and third-party review can take as long as 1 year to perform per region. AEP has three regions (PJM, SPP, and ERCOT), which each take this amount of time. With the proposed proximity/applicability changes, scenario changes, and this implementation period would be insufficient time to adopt and reperform the assessment. In addition, given the new proximity criteria some small TOs may not have had any applicable stations previously and will have to create a new methodology and perform the assessment from scratch within that short 24-month period.

MPC disagrees with the requirement to perform an analysis under CIP-014-4 prior to the effective date of the standard. This will very likely require utilities to perform a largely duplicative analysis in less than 30 months from their previous analysis. Such a duplicative analysis increases the study burden on utilities for no foreseeable benefit to BES reliability.

BPA appreciates the addition of the clarifying language about the first R5 due date. However, BPA identifies a potential overlap or gap when considering the current review cycle for the standard against a 24-month implementation plan. It is possible that an entity would have to adopt the new language extremely early to align with its next Version 3 cycle or perform an extra round of CIP-014 activities during the period in between Version 3 activities. BPA recommends using terminology such as that found in other standards such as FAC-014-3 R6: “Requirement R6 shall be implemented by the Planning Coordinator or Transmission Planner following the effective date of FAC-014-3 when it begins its next cycle for conducting the studies to support its Planning Assessment." BPA believes the inclusion of this language would help to reduce overall costs for the implementation of the changes.

7. Do you agree that CIP-014-4 is cost effective to address the reliability issue of physical security? If no, why not?

Ronald Hoover - Bonneville Power Administration - 1,3,5,6 - WECC

Answer	No
Document Name	

Comment

BPA does not believe the standard, as is, is cost effective in addressing the reliability of physical security. The spectrum of sites is too broad. BPA believes there is high potential for sites to be identified on CIP-014-4 list that would have little to no effect on the BES if they were disconnected from the grid. The standard, as is, allows sites with RAS capability to be listed as CIP-014, which mitigates an enormous amount of risk, some might argue all. The number of sites that could potentially be categorized as CIP-14 takes resources away from other sites along critical pathways, and sites that directly link to critical infrastructure. Additionally, day-to-day operations of upstream and downstream sites affect whether singular or multiple pieces of equipment in a site are critical. BPA finds the inclusions of R2.1 and R2.2 are so broad as to compound the issues of cost without a large gain in security or reliability. BPA believes the increase in CIP-014 applicability may require more resources than some smaller Transmission Owners have at their disposal. This increase will not only strain the resources of those smaller Transmission Owners but those of larger size within a BA that may be called upon to assist.

Response

Leshel Hutchings - AEP - 3

Answer	No
Document Name	

Comment

While this SAR focused on the R1 risk assessment, the most effective protection against all possible threat vectors is to plan redundancy into the Transmission system to remove single points of failure. Protecting individual stations against specific threats will always be less effective than Transmission build out. The standard should be revised to consider Transmission Planning mitigations rather than defaulting to adding physical security.

Rebika Yitna - Rebika Yitna On Behalf of: Roger Brand, MEAG Power, 3, 1; - Rebika Yitna

Answer	No
Document Name	

Comment

Performing the risk assessment every 36 months rather than every 60 months for those entities with no applicable stations/substations in the previous risk assessment does increase cost for TOs internally and increases the cost of using an unaffiliated 3rd party to verify the risk assessment. Also, it is expected with the newly added 'proximity within 1/2 mile', stations/substations in R2 will incur additional cost burden and not be cost effective, especially if the station/substation in 'proximity within 1/2 mile' is also found to be applicable and requires physical security enhancements to address any potential threats and/or vulnerabilities.

The issues of requiring Transmission Owners perform a Transmission Planning/Planning Coordinator function is problematic and makes assessment of cost-effectiveness unclear. Additionally, this dynamic will continue to lead to lack of clarity and consistency in the auditing of this standard which could result in cost and workload to address/respond to the requirements and audit reviews. Additionally, the requirement to add stations that are within a ½ mile radius of applicable stations will add more cost without any justification for the requirement. Furthermore, requiring a third-party verification of a planning assessment appears to be an unnecessary expense. Is there supporting evidence from the 2015 – 2024 time-period to show the benefits of this verification?

Lucinda Bradshaw - Lucinda Bradshaw On Behalf of: Byron Booker, Oncor Electric Delivery, 1; - Lucinda Bradshaw	
Answer	No
Document Name	
Comment	
The comments above demonstrate that additional clarity is needed on certain portions of this revised CIP-014-4. Without that additional clarity, Oncor cannot state that the proposed changes to CIP-014-3 are cost effective. As noted above, some of these proposed revisions create additional burdens on TOs that could increase costs to TOs. For example, the additional burdens on TOs created in R2 and R4 will require new procedures and processes to be developed, documented, approved, and implemented – including the development and implementation of additional training concerning the new requirements.

Teresa Krabe - Lower Colorado River Authority - 5	
Answer	No
Document Name	
Comment	
The cost-effectiveness of CIP-014-4 in addressing physical security and reliability concerns is not entirely clear. The changes introduced, particularly regarding proximity criteria, may lead to a broader range of substations being classified for criticality assessment. This expansion could result in increased costs for compliance and implementation.

The cost-effectiveness of CIP-014-4 in addressing physical security and reliability concerns is not entirely clear. The changes introduced, particularly regarding proximity criteria, may lead to a broader range of substations being classified for criticality assessment. This expansion could result in increased costs for compliance and implementation.

There are two requirements that increase the cost to complete this study that do not improve reliability significantly. The first is R4. Collecting existing documentation on compliance responsibilities will only improve reliability if neither entity is performing a CIP-014 on specific sites. In NERC's, report this was not identified as a reliability gap. The second is for R2 where entities need to one share their existing and planned future applicable sites with other entities in order to receive data on whether or not they have or plan to build a transmission site nearby. Based on the footprints and configurations of a Transmission Owners facilities, this could involve disclosing to a number of entities information that is deemed sensitive if not CEII.

It is not clear to us if CIP-014-4 is cost effective to address reliability issue of physical security. Changes introduced in CIP-014-4 with respect to proximity criteria (R1 and R2) may result in additional stations becoming applicable for criticality assessment, thereby potentially increasing costs.

The SAR states: "The cost impacts for the proposed changes to CIP-014-3 are expected to be minimal. The changes add clarity to the current Standard to bring consistency and clarify expectations for effectively evaluating for instability, uncontrolled separation, and Cascading following a physical attack. The upper limit of cost added to entities is bounded due to no alteration of applicable substations potentially receiving security control upgrades. Rather, the cost incurred will be on the additions of study rigor, which again are anticipated to be relatively minimal."

The Drafting team has not provided additional data, and the dynamic and steady-state requirements are outside of the TO's area of responsibility. This requires a TO to access this expertise through contracting or other methods. The Drafting Team has failed to identify how this Standard may further capture additional Facilities, and require entities to take further security mitigations.

The Implementation Plan will require entities to reevaluate all of the risk assessment processes sooner that the current 36-month review period, since they will have to be compliant with all Facilities with 24 months of the proposed standard. This proposed standard fails to conduct a cost impact study, and we believe there are significant hidden costs in implementing this proposed standard.

The second draft of CIP-014-4 sufficiently addresses many of the issues described in the SAR and provides an appropriate level of detail in the risk assessment requirements. Broadly, the second draft of CIP-014-4 is an improvement on CIP-014-3 and will improve consistency in risk assessment methodology throughout the industry. The cost effectiveness of CIP-014-4 for addressing physical security is difficult to determine, but the improvements over CIP-014-3 are appreciated.

Overall, ATC can stand behind most of the changes but would like to see updates on Requirement R2 before moving forward.

Additionally, please clarify in this standard if TOs and TOPs still need to do a study or assessment on previously qualified facilities if our company's corporate security team has voluntarily determined they were going to implement the highest level of physical security they have for a new or existing site. Does the SDT intend for TOs and TOPs to have to study those sites if they were already going to be classified at that high level of security. If not, this would be a really good exception to note that would save many companies a lot of time and effort.

The CIP-014-4 standard introduces a significant change by requiring the inclusion of stations within a 1/2-mile line of sight or easily accessible from a common roadway. However, the standard lacks clear guidelines for selecting stations. This could lead to inconsistencies and challenges in implementation, as different Transmission Owners and Transmission Operators may interpret and apply the criteria differently.

To improve clarity and ensure consistent implementation, the standard should provide more detailed guidance on the selection of stations, including specific criteria for evaluating lines of sight and ease of access from common roadways. This would help Transmission Owners and Transmission Operators to better understand the requirements and apply them consistently, ensuring the reliability and security of the electrical grid.

Can the standard also provide a process diagram showing activities (at least for the Risk Assessment portion) alongside a time scale which would help to show the overlap of frequency of report (start to start) overlapping with how far the study should look out for facilities to be in-service. This has been a source of confusion in the industry and although was not required in the SAR, will help to clarify many misunderstandings.

To reiterate my comment from R3... we have experienced disagreement with regulators about what type of physical attack we are supposed to be simulating. The regulators we spoke with expected a severe "smoking crater" scenario, but our physical security personnel suggested looking at what the most likely scenarios would be (i.e. things seen in previous incidents). The standard provides no guidance here and leaves the choice of scenarios up to us. The type of attack to expect is not something that seems like it would vary by utility, so it makes sense that the standard would specify this rather than leaving it up to individual entities to determine. Some guidance in the standard would help clear up the ambiguity so that we can choose appropriate contingencies to run and avoid friction with regulators.

AZPS appreciates the clarifications included by the DT in this draft, however continues to seek additional clarifications regarding entity responsibilities or exclusion of responsibilities for non-owned/operated stations/substations within proximity of identified locations. For example, the relationship and requirements between Transmission Owners and Transmission Operators when adjacent facilities are involved is not clear. The Transmission Owner and Transmission Operator can be different entities and R8 states the notification is made to the adjacent Transmission Operator. The Transmission Owner performing the assessment and identifying the facilities in R5 will be subject to doing the Physical assessments and protection, however it is not clear how the Transmission Owner of the adjacent facility is notified and what, if any, requirements they have.

The primary issue with this standard as it is written, and as this draft continues is the application of requirements/expectations appropriate for the Transmission Planner/Planning Coordinator function to the Transmission Owner instead. This reduces clarity on the types of studies to be performed to assess the extreme events identified in this standard.

Regarding R6:

With an attempt at clarifying study criteria, though they should be applied to the appropriate planning entity, there is no reason to maintain a requirement for an unaffiliated third party to perform a verification of a transmission planning analysis associated with the risk assessment. Instead of requiring planning entities be the third-party verifier, they should just perform the study under clearly defined requirements in a TPL standard and communicate this information to the Transmission Owner. It is also important to note the third party verifying the risk assessment for this physical security standard is not required to have expertise in that area according to this requirement. Additionally, the SDT should consider removing the Reliability Coordinator as a potential third-party verifier as that function does not perform the type of analysis being sought in this standard.

Additional Comment:

The analysis outlined in the CIP-014 standard is an evaluation of an extreme event and is based on transmission planning analysis. Currently, the existing TPL-001 standard requires the evaluation of extreme events, though, it is not specific to this particular substation outage analysis and corrective actions are not required for these events. Additionally, there are ongoing efforts to establish a separate standard to address the long-term planning analysis around extreme weather events. It would seem NERC and the industry are potentially missing an opportunity to consolidate requirements around the evaluation of extreme events better than what is currently provided for in the current construct of the existing and planned Reliability Standards. Consideration should be given by NERC to provide a better pathway to house long-term planning requirements around extreme event analysis within the TPL standards (not CIP) and specify the reliability analyses needed, the parameters for determining reliability, expectations for corrective actions, and the communication path from planning to owners and others with a reliability-related need for this information. The planning assessment/CAP required by TPL-001 is already required to be distributed to applicable owners. Clarifying the extreme event expectations in TPL-001 to specify the substation outage alluded to in CIP-014 is one pathway to better align standard requirements with the appropriate entity.

Southern Company recommends swapping Requirement R3 and R4 chronologically. This follows a more logical approach of identifying the stations and responsibilities to perform the assessment in the first three requirements followed by an assessment methodology in R4 and the performance of an assessment in R5. Southern Company recommends removing Requirement R6. With the understanding that this is not explicitly in scope of the current SAR, the added specificity of the proposed standard eliminates the reliability benefit of the third-party verifier. Additionally, based on a previous audit of CIP-014-3, Southern Company did not observe the Regional Entity take into consideration the review by the R2 third party verifier. If this is consistent across other Regional Entities, then an elimination of CIP-014-4 R6 may be appropriate due to the extra cost and the lack of a reliability benefit.

WAPA recommends the SDT remove the third party verification Requirement R6. WAPA is concerned that this requirement holds an entity responsible for the actions of another organization, and creates the risk of non-compliances when a separate reviewer fails to complete their work on time.	

While this elimination is not explicitly mentioned in the SAR, it is directly tied to the changes proposed in the SAR. The purpose of the third party verification goes away with the increased prescriptiveness of the risk assessment being made in the drafts of CIP-014-4. In addition, since the SAR indicates that industry was not implementing a consistent approach to the risk assessments, then that indicates the third party verifications were also proving to be of little value. This independent verification is a burdensome and costly endeavor that has not proven to be value-added. Planning this task with eligible vendors requires significant work to coordinate and thousands of dollars to complete. Given that the verifications exist solely to offer feedback on an approach which will no longer be required with the increased specificity in R3, then their removal would eliminate what has become an unnecessary administrative burden.

AEP's Additional Comments:

1. There is a typo in R8 Section 8.3 which could be corrected in this revision. "Electricity Sector Information Sharing and Analysis Center (ES-ISAC)" should say "Electricity Information Sharing and Analysis Center (E-ISAC)".
2. The level in the VRF/VSL justification does not match the VRF/VSL levels in the standard draft for R2 and R3 – these need to be aligned.

R6.3: Eversource requests R6.3 allow for 90 days instead of 60 so proper work can be completed. With a more detailed analysis being required, there is a higher chance of disagreement with our third party reviewer, requiring more time needed for response. **Overall,** Eversource appreciates the efforts of the drafting team and overall is in agreement with the current draft. Eversource's concerns of the use of the phrase "planned to be in service" in R1 is the only portion of the updated standard keeping the company from being in favor.

The Drafting Team's survey should be rethought going forward. Simple asking for a response that a requirement meets the SAR is lazy and requires the respondent to search the SAR for where the individual requirement may fit. The Drafting Team is encouraged to identify and map where a requirement is addressing each issue in the SAR. This will allow the respondent to provide much more specific feedback. As in other standards that have specific applicability, all TOs should have to meet the R1 requirement every 36 months. They would then be able to determine their applicability to the other requirements if they meet the threshold. TO's do not have transmission planning resources, and requirements that require the entity to do transmission studies, should be assigned to Transmission Planners or Planning Coordinators. If this is not done, the results of the effects of losing one or more transmission Facilities will be inconsistent and potentially could conflict with TPL-001 results.

Treymayne Brown – ReliabilityFirst – 10

Question 1 – Yes

Question 2 – No

Comment: The requirement should more clearly state which Transmission station(s) and substation(s) should be included in this evaluation. Based on the way this Requirement is presently written, there is ambiguity around which Transmission station(s) and substation(s) should be included that could lead to the entity not evaluating multiple station(s) simultaneously based on their documented criteria.

Recommend revising the wording to explicitly state "document and implement" in order to eliminate any vagueness. This change clarifies the expectation and removes any ambiguity regarding the steps required. By specifying both documentation and implementation, it ensures there is no implied assumption that one necessarily follows the other without clear action.

Question 3 – No

Comment:
R3
- Based on the wording, the requirement can be interpreted that the entire loss of the station is not required. The word "entire loss" should be added here for clarity. - Additionally, the phrase "post-event response" is too vague. To provide more detailed and enforceable guidance, it should be replaced with specific criteria such as "thermal overloads, voltage magnitude, voltage deviation, voltage recovery, frequency magnitude, frequency deviation, and frequency recovery." These terms would offer clear metrics for assessing the impact of post-event conditions and provide a stronger foundation for compliance and also reinforces the type of analysis required.

3.2 should be more descriptive for entities to ensure consistency on how they determine which stress cases are used. Stress scenario should also be clearly defined in the required methodology. In addition, 3.2 does not provide any guidance on the year of study (e.g., one year out, two, five, etc.). RF would like to recommend modifying the R3 Measurement to require the entity to submit the risk assessment, similar to the R6 Measurement.

Question 4 – Yes

Question 5 – No

Comment: The standard does not specify which study year should be used when conducting risk assessments. This is a significant issue, as it mirrors a gap in the current CIP-014 standard. The lack of clarity creates the potential for a reliability gap if an entity uses a case study from two years out but only performs the study every three years. This could result in assessments based on outdated data that do not accurately reflect the current risks. It is crucial to revise the standard to define the specific study year to be used for assessments, ensuring consistency and reliability across entities. Additionally, the model and contingency list used in the study must be reviewed for accuracy, ensuring they reflect the conditions of the year in question. Moreover, the risk assessment should include not only the entity's own systems but also those of its neighboring entities. This broader perspective ensures a more comprehensive understanding of potential risks and enhances the effectiveness of the overall security posture.

5.1 should be revised to provide more flexibility to the responsible entity. Specifically, it is recommended to add language that allows entities the option not to perform a risk assessment for Transmission station(s) or substation(s) that have already been identified as critical and have enhanced physical security protections in place. This would prevent redundant assessments while ensuring that high-risk assets remain secure.

Question 6 – Yes

Question 7 – Yes

Consideration of Comments

1. Do you agree with the modifications made in CIP-014-4 with modified Requirement R1 to address the issues identified in the SAR?

Kevin Conway - Western Power Pool - 4

Answer	No
Document Name	

Comment

There is a disconnect between the listed responsibility in the Applicability Section 4.1 and R1. Does the Drafting team expect ALL TOPs to comply to R1, or ONLY those who have facilities that meet the criteria of Attachment 1? There is a high likelihood that auditors will interpret that ALL TOPs will have to complete R1 and show that they scored their facilities to determine applicability under Attachment 1.

We suggest that the applicability section include ALL TOPs, and the requirements be modified to have all TOPs complete R1, then if they have not met the criteria of Attachment 1, they stop and have no additional compliance obligation. This would more clearly identify who is applicable to the Standard and eliminate a lot of ambiguity of what the auditors will need to verify that an entity is not applicable to the standard.

Dislikes 0	

Response

Thank you for your comments. TOPs are not called out in requirement R1; Applicable TOPs are only required to comply with those requirements where they are explicitly called out.

Tamarra Hardie - Tamarra Hardie On Behalf of: Diane E Landry, Public Utility District No. 1 of Chelan County, 3, 5, 1, 6; - Public Utility District No. 1 of Chelan County - 6, Group Name CHPD

Answer	No
Document Name	Near-Term vs Long-Term - Glossary of Terms.docx

Comment

It appears that the Draft 2 changes to R1 clarified that the list is to be documented once every 36 months for all applicable stations “that are existing or planned to be in service within 36 months”, which is an improvement from the previous draft version. This improves clarity but the R1 VRF Time Horizon still states that R1 applies to ‘Long-term Planning Horizon’, whereas the NERC Glossary of Terms defines the ‘Near-Term Planning Horizon’ as the window covering year 1 through 5. This requirement references ‘within 36 months’, so it is recommended that the R1 VRF Time Horizon language is updated to reference the ‘Near-Term Transmission Planning Horizon’. Please see attached document “Near-Term vs Long-Term - Glossary of Terms”.

Likes 0	
Dislikes 0	

Response

Thank you for your comments. NERC Time Horizons define “Long-term Planning” as “a planning horizon of one year or longer”. This document is located on NERC public site: Document Portrait.

Joshua London - Eversource Energy - 1, Group Name Eversource

Answer	No

Document Name	
Comment	

Eversource is looking for clarity on what is meant by the phrase “Planned to be in service.”

Eversource suggests either providing more prescriptive language around at what point in the process a project is considered “planned,” or make the following change:

Each Transmission Owner, at least once every 36 calendar months, shall document a list of applicable Transmission station(s) and Transmission substation(s) meeting any of the criteria in Attachment 1 that are either existing or planned, **as defined by the Transmission Owner,** to be in service within 36 calendar months**.**

Likes 0	
Dislikes 0	
Response	

Thank you for your comments. “Planned to be in service” is a term taken from CIP-014-3 and the meaning is unchanged from the currently effective version. "Planned to be in-service" should be taken to mean all Transmission station(s) and Transmission substation(s) as modeled in the base cases for the Long-Term Transmission Planning Horizon.

Ronald Hoover - Bonneville Power Administration - 1,3,5,6 - WECC	
Answer	No
Document Name	
Comment	

BPA believes the current language of R1 seems to be intended to create auditable documentation of the same outcome that is already achieved when a Registered Entity evaluates the current Applicability section. BPA suggests restoring applicability content to the Applicability section and changing R1 language for applicable Registered Entities to maintain the list of applicable stations or substations obtained through evaluation of the Applicability section.

Likes 0	
Dislikes 0	
Response	

Thank you for your comments. The Drafting Team moved the language to an attachment due to the breadth of the language addition. The applicability language should remain where it is to allow entities an “off-ramp” to the standard requirements if they do not have applicable Transmission stations or substations.

Thank you for your comments. "Planned to be in service" is a term taken from CIP-014-3 and the meaning is unchanged from the currently effective version. "Planned to be in-service" should be taken to mean all Transmission station(s) and Transmission substation(s) as modeled in the base cases for the Near-Term Transmission Planning Horizon.

Lucinda Bradshaw - Lucinda Bradshaw On Behalf of: Byron Booker, Oncor Electric Delivery, 1; - Lucinda Bradshaw

Answer	No
Document Name	

Comment

Oncor does not agree with the provision requiring consideration of Transmission station(s) and Transmission substation(s) that are planned to be in service within 36 calendar months because that time frame is beyond Oncor's accurate planning time frame, particularly given the large amount of growth currently being experienced in Oncor's service area. Instead, Oncor recommends that the provision be revised to require consideration of Transmission station(s) and Transmission substation(s) that are planned to be in service within 24 months.

Jennifer Mcnally - Duke Energy - 1,3,5,6 - Texas RE,SERC,RF

Answer	No
Document Name	

Comment

Duke Energy still has concerns that the timeline for the performance of R1 is not clear. We recommend that the assessment be performed within 36 months of *the completion* of the previous R1 assessment. We also recommend the end of R1 specify "planned to be in service in the model year three years out from the year in which the assessment is performed". Years capture more accurately how planning is conducted. As written in draft 2, if the assessment is performed in October 2024, will using a planning model from Summer 2027 be acceptable? With the current language using 36 months, we have concerns that it would not be.

If the drafting team is not willing to consider referencing years for modeling, we recommend that they consider clarifying with a footnote that for planning purposes, the model year should be at least three years out from the start of the assessment.

Dislikes 0	

Response

Thank you for your comments. The proposed implementation plan allows an adequate transition between CIP-014-3 R1 risk assessment and CIP-014-4 R5 risk assessment. The initial risk assessment required by Reliability Standard CIP-014-4 Requirement R5, must be completed on or before the effective date of the standard. Subsequent risk assessments shall be performed no later than 36 calendar months following the effective date of Reliability Standard CIP-014-4. In the previous version of CIP-014, the 30-month time frame and the 24-month planned-to-be-in-service date could, if not carefully applied, lead to gaps between models and study horizons. Per the Standard Authorization Request (SAR), CIP-014-4 has consolidated these multiple timelines into one. Requirement R1 is revised to ensure that each Transmission Owner establishes a list of applicable Transmission station(s) or Transmission substation(s) in accordance with Attachment 1. Aligning the 36 calendar months look ahead in Requirement R1 with the 36 calendar month risk assessment cycle ensures that system topology of the cases used to assess applicability is

consistent with the system topology in the risk assessment models. Planned to be in-service" should be taken to mean all Transmission station(s) and Transmission substation(s) as modeled in the base cases for the Near-Term Transmission Planning Horizon.

If the assessment is performed in October 2024, using a planning model from Summer 2027 is acceptable.

Comment

We agree with the intent of CIP-014-4 to address issues identified in the SAR, however we would like to suggest changes to improve readability.

There is some interplay between R1 and R2 through Attachment 1 that makes identification of “applicable” stations confusing. R1 refers to Attachment 1 to identify “applicable” stations based on the weighting criteria in Table 1. Attachment 1 section 2.1 requires user to refer to R2 and apply proximity criteria to stations that were not applicable in R1.

To meet the intent of SAR to identify station “groups” that meet applicability criteria of Attachment 1, it may be best to identify station groups separately under R2 as a sub-requirement (i.e. move Section 2.1 from Attachment 1 to sub-requirement R2.2) and make Attachment 1 agnostic of stations or station groups. This separates intent of R1 and R2 and allows both requirements to reference Attachment 1 applicability criteria. R1 will identify

individual stations that meet Attachment 1 applicability criteria. R2 will identify station groups with stations that were individually non-applicable under R1, but when combined with other non-applicable station(s) – based on proximity criteria of R2, may be applicable per Attachment 1 Table 1.

The CIP-014-4 standard introduces a significant change by requiring the inclusion of stations within a ½-mile line of sight or easily accessible from a common roadway. However, the standard lacks clear guidelines for selecting stations. This could lead to inconsistencies and challenges in implementation, as different Transmission Owners and Transmission Operators may interpret and apply the criteria differently. To improve clarity and ensure consistent implementation, the standard should provide more detailed guidance on the selection of stations, including specific criteria for evaluating lines of sight and ease of access from common roadways. This would help Transmission Owners and Transmission Operators to better understand the requirements and apply them consistently, ensuring the reliability and security of the electrical grid.

c) From a compliance perspective, it is recommended to provide more prescriptive language in the standard or within the technical rationale, to help entities in identifying planned projects around how a project is considered “planned,” or make the following change:

Each Transmission Owner, at least once every 36 calendar months, shall document a list of applicable Transmission station(s) and Transmission substation(s) meeting any of the criteria in Attachment 1 that are either existing or planned, **as defined by the Transmission Owner**, to be in service within 36 calendar months

b) With respect to the scoring in Attachment one, it’s unclear if transmission lines in series with a stepdown transformer would be included if the secondary voltage was 138 kV (as one example). Could the SDT identify if the scoring is based on the high side voltage or low side voltage? LIPA suggests a footnote identifying the voltage class used to determine qualification should be added below the scoring table.

c) In addition, since 500 kV facilities meet the Attachment 1 criteria 1, it seems as though the line item in the table for 500 kV and above may be removed as to avoid confusion.

Response	

Thank you for your comments and support. “Planned to be in service” is a term taken from CIP-014-3 and the meaning is unchanged from the currently effective version. "Planned to be in-service" should be taken to mean all Transmission station(s) and Transmission substation(s) as modeled in the base cases for the Near-Term Transmission Planning Horizon.

Regarding the scoring of the Attachment 1, the summing of the lines for the aggregated value should be done regardless of whether or not the line terminates into a transformer.

Regarding your comment on the 500 kV Facilities in Attachment 1, the DT has addressed the issue by changing “0” to “N/A”.

Ruida Shu - Northeast Power Coordinating Council - 1,2,3,4,5,6,7,8,9,10 - NPCC, Group Name NPCC RSC	
Answer	Yes
Document Name	
Comment	

The NPCC RSC is looking for clarity on what is meant by the phrase “Planned to be in service.”

The NPCC RSC suggests either providing more prescriptive language around how a project is considered “planned,” or make the following change:

Each Transmission Owner, at least once every 36 calendar months, shall document a list of applicable Transmission station(s) and Transmission substation(s) meeting any of the criteria in Attachment 1 that are either existing or planned, **as defined by the Transmission Owner,** to be in service within 36 calendar months.

There needs to be more explanation on how the ½ mile criteria works with 2.1 and 2.2. As is written, the language in this section is confusing.

Is the ½ mile the maximum distance to consider, but you need to consider the line of sight too criteria too?
If two stations are within ½ mile of each other, but not in a direct line of sight, how does that impact the qualifications?

ATC recommends eliminating 2.1 and 2.2 to remove the confusion or to have some clarifying examples or sentences in the standard to explain how these sections work together.

Also, the inclusion of non-owned substations (i.e., the “irrespective of ownership” language) may also introduce further complications for TOs in their study analysis and should be further clarified what steps need to be taken to account for these non-owned stations.

The CIP-014-4 standard introduces a significant change by requiring the inclusion of stations within a 1/2-mile line of sight or easily accessible from a common roadway. However, the standard lacks clear guidelines for selecting stations. This could lead to inconsistencies and challenges in implementation, as different Transmission Owners and Transmission Operators may interpret and apply the criteria differently. To improve clarity and ensure consistent implementation, the standard should provide more detailed guidance on the selection of stations, including specific criteria for evaluating lines of sight and ease of access from common roadways. This would help Transmission Owners and Transmission Operators to better understand the requirements and apply them consistently, ensuring the reliability and security of the electrical grid.

½ mile is a very wide separation criterion for adjacency. A reasonable separation within 200 feet or so seems a more practical consideration for adjacent substations that may be impacted by a single physical event. An event simultaneously impacting 2 stations with ½ mile separation will be difficult to protect from physical security standpoint and cost prohibitive. This aligns with PSE past comments (in June 2024): *It is not clear the type of events CIP-014-4 intends to address that can simultaneously impact 2 or more stations. The standard depends on physical security measures to mitigate such events, however mitigation to the extent may not be feasible nor cost effective.*

Response	
Thank you for the comment. The Drafting Team has reduced the separation requirement, added clarification on the reference point for measurement and added language in the Technical Rationale to explain the reason for the chosen distance.	

Alison Nickells - NiSource - Northern Indiana Public Service Co. - 1	
Answer	No
Document Name	

Comment

NIPSCO agrees with CenterPoint Energy Houston Electric, LLC (CEHE). *"Line of sight" or "ease of access" in Requirement R2 are arbitrary values and should not be used to comply with NERC requirements*

NIPSCO also agrees with AEP. *The intent is to identify close physical proximity such that a singular event could impact both stations; other ranges are irrelevant.* ***Emphasize explicitly in the standard language or Guidelines and Technical Basis that this considers only a single, simultaneous attack****. Considering non-simultaneous attacks makes the number of scenarios infinite and is not feasible to analyze or protect against.*

NIPSCO also agrees with Georgia Transmission Corp: *The intent of the requirement is understood and appreciated. However, the nature of the "single physical attack" needs clarification. Interpretations of this attack can range from events where elements are lost with some time delay between failures (gun shots for example) to a simultaneous loss of all elements (large explosion?). Clarity on the nature of the physical attack or parameters that can be applied to define the attack are needed to avoid differing interpretations of what event is to be studied and how this requirement is to be audited.*

Additionally, this guidance is appropriately located in the TPL space to clarify to planning entities what type of extreme event needs to be evaluated and subsequently communicated to the Transmission

Thank you for the comment. The Drafting Team has removed requirements R2.1 and R2.2 from the draft standard.

Ellese Murphy - Ellese Murphy On Behalf of: Katherine Street, Duke Energy , 5, 6, 1, 1; - Ellese Murphy	
Answer	No
Document Name	

Comment

Duke Energy does not support the language proposed for R2. The fundamental issue still exists that R2 is not tied to likely threat vectors identified within an entity's security program. We understand that due to the sequencing of the requirements that linking to R8 is not feasible but do think that more general reference to likely threat vectors identified by the entity would create a more meaningful requirement. If the Drafting Team prefers to create R2 in a way that has a uniform distance requirement for proximity sites, we believe that the distance should be based on ballistic threats and a more reasonable distance would be 1000ft. We do not find the ½ mile radius to be technically justified. Duke Energy supports prescribing that line of sight be addressed in documented criteria but does not support prescribing ease of access from a common roadway and supports EEI's comments on this. Ease of access from a common roadway is far more subjective than line of sight and less immediately relevant for a coordinated attack.

It is also still unclear how the criteria can use sites in proximity irrespective of ownership and Duke Energy supports EEI membership's concern on this issue. The requirement to study sites identified in R2 that are not owned by your company creates an unclear path forward for conducting the studies. It is likely that many of these proximity sites will not even be part of the BES and could be owned by entities that do not have any BES assets. There is no mechanism to force these entities to provide the data that would be needed to perform the R3 analysis and comply with CIP-014. We encourage the Drafting Team to consider whether it makes more sense to account for sites of differing ownership when they are determined to be applicable in accordance with Requirement R1 by a different registered entity. Duke Energy recommends the following language for R2:

Each Transmission Owner shall have documented criteria to determine their Transmission station(s) or Transmission substation(s), that are adjacent, adjacent meaning having a perimeter fence within 1000 ft of the perimeter fence of an applicable Transmission station or Transmission substation documented in Requirement R1, that could be impacted by a single physical attack that from likely threats vectors. The Transmission Owner must also include in their criteria identification of adjacent transmission station(s) or substation(s) that are owned and determined to be applicable in accordance with Requirement R1 by a different registered entity. From the adjacent Transmission station(s) or Transmission substation(s), the criteria shall also identify Transmission station(s) or Transmission substation(s) within line of sight from a single location without obstruction of an applicable Transmission station or Transmission substation documented in Requirement R1.

Thank you for the comment. The Drafting Team has reduced the separation requirement, added clarification on the reference point for measurement and added language in the Technical Rationale to explain the reason for the chosen distance. Additionally, they have removed requirements R2.1 and R2.2, which pertained to line-of-sight and ease of access.

Gail Elliott – Gail Elliott On Behalf of: Michael Moltane, International Transmission Company Holdings Corporation, 1; - Gail Elliott

Answer	No
Document Name	

Comment

Comments: {C}{C}{C} {C}{C}ITC does not support the changes identified in R2. ITC recommends R2 and all its subparts be revised. The proposed R2 language by the drafting team provides concerns due to the high probability of missing a substation located within the 0.5 mile radius as the TO would not have the required information of all existing nearby facilities nor have the information necessary to identify that the electric facility is a transmission station. Furthermore, a TO is to identify any future transmission stations that could be constructed within 3 years which would be even more difficult to locate. ITC proposes the following for R2 and its sub-parts.

If the TO has identified that it has multiple fenced areas on a site that it considers as one station, there is not clarity if R2 would be applicable. Would these instead just apply to R1?

R2. Each Transmission Owner shall have documented criteria to determine those of its Transmission station(s) and Transmission substation(s) within ½ mile of an applicable Transmission station or Transmission substation documented in Requirement R1 that could be impacted by a single physical attack. The criteria shall address at a minimum the following:

{C}2.1 Line of sight between multiple Transmission station(s) or Transmission substation(s) from a single location without obstruction.

If an entity has multiple fenced areas on a property site but they consider these all one station would they be non-compliant if the loss of all sites was not studied.

Finally, the identification of a physically adjacent site to an applicable station as being critical has issues if the site is not owned by the same entity as the applicable site. If mitigation measures are needed, which entity shall determine the scope of these mitigations and who should pay for them.

Likes 0

Response
Thank you for the comment. Ownership and identification of proximate transmission stations and substations is an explicit requirement of the SAR (see Project Scope item 5). Proximate substation identification can be achieved through publicly available tools such as Google Maps and cross-referenced with model data to identify specific transmission facilities. The Drafting Team assumes the responsible entity will choose a model that reflects the requirements of the standard and contains appropriate future projects, including distance from applicable substations owned by the responsible entity.

John Pearson - ISO New England, Inc. - 2	
Answer	No

Document Name	

Comment

R2, when combined with other requirements such as R3.3, can lead to an overly conservative outcome. In R2, stations can be grouped together due to being in close proximity to each other. Then testing is done to understand the impact of the loss of the proximity group under R3.3. By way of example, assume that there are two stations near each other, one being a very large station with numerous transmission lines connecting to it, where if tested individually, would result in significant concerns on the remaining system. The second station is a very small station, that if tested individually would have no meaningful impact on the remaining system. When they are grouped together, the results would not be meaningfully worse than the event occurring at the large, well-interconnected station, yet the second station would get swept into needing CIP-014 upgrades simply because of its proximity, rather than the results of the test being worse. This would require customers to pay for unnecessary physical protection measures to be installed at the smaller station.

Likes 0	
Dislikes 0	

Response

Thank you for the comment. The proximate station would have no physical security obligations if the applicable substation was protected, as protecting the applicable substation invalidates the physical attack being studied under requirement R5.

Scott Langston - Tallahassee Electric (City of Tallahassee, FL) - 1

Answer	No
Document Name	

Comment

TAL does not agree with a Transmission Owner making a determination on a Transmission station or Transmission substation that they do not have ownership. This should be the responsibility of the station or substation owner to make those determinations.

Likes 0	
Dislikes 0	

Response

Thank you for the comment. It is unclear to the Drafting Team what "making a determination" means. If it means identifying the location of proximate Transmission stations or substations, then identification of ownership is not needed to make such a determination. If "making a determination" implies ascertaining physical security upgrades which have cost implications, the proximate Transmission station or substation has no obligation to protect its site if the applicable Transmission station or substation does so as the result of an R5 risk assessment.

Rachel Schuldt - Black Hills Corporation - 6, Group Name Black Hills Corporation - All Segments

Answer	No
Document Name	

Comment

Black Hills Corporation agrees with EEI's suggestion to strike R2, Part 2.2. R2, Part 2.2 is not needed to meet the primary objectives in the SAR.

Black Hills Corporation also agrees with EEI's suggestion to add examples to the technical rationale describing how to apply the ½ mile distance criteria and line of sight criteria.

Likes 0	
Dislikes 0	

Response

Thank you for the comment. The Drafting Team has reduced the separation requirement, added clarification on the reference point for measurement and added language in the Technical Rationale to explain the reason for the chosen distance. Further clarification required to stations in proximity.

Understandably the standard is trying to not be too prescriptive. Is the expectation that the TO use their own discretion to determine which stations are impacted by proximity stations? And then take actions accordingly? Could the wording in the standard result in entities all performing their own methodology (from very limited to thorough) which will result in a request to form another SDT to review and be more prescriptive because they are inconsistent.

Clarification is required on what is the expectation and responsibility of a TO inform a neighboring entity they station needs to be reviewed to comply with CIP-014, if it is in proximity. How much can this be enforced by one entity to another. What do we do if its not a transmitter, but a GO.

Response

Thank you for the comment. The Drafting Team has reduced the separation requirement, added clarification on the reference point for measurement and added language in the Technical Rationale to explain the reason for the chosen distance. Additionally, the DT has removed requirements R2.1 and R2.2, which pertained to line-of-sight and ease of access.

The first balloted draft was more prescriptive than the second and the Drafting Team received many comments to make the second draft less prescriptive.

The proximate station would have no physical security obligations if the applicable substation was protected as protecting the applicable substation invalidates the physical attack being studied under requirement R5.

James Baldwin - James Baldwin On Behalf of: Matt Lewis, Lower Colorado River Authority, 5, 1; - James Baldwin

Answer	No
Document Name	

Comment

Complying with this requirement may present several challenges.

(R2) We believe having a clearly defined proximity criteria of ½ mile is acceptable.

It should be made clear that both sub-requirements (R2.1 and R2.2) are required to be applicable with an “and”.

(R2.1) It may be challenging to establish, document and audit what constitutes as “line of sight”. Factors such as terrain, vegetation, and existing infrastructure can obscure the view. Additionally, these factors may be point-in-time and line of sight could be obscured during initial risk assessment but visible during an Audit site visit.

(R2.2) Assessing the ease of access from roadways requires a thorough understanding of public access. Identifying all routes to a facility, especially in rural or less developed areas, can be challenging.

Also, this requirement may bring new Registered Entities that do not meet R1 into scope. Following the identification of an applicable substation per R2 owned by another Registered Entity, how will a TO ensure that necessary security measures are put in place by the adjacent TO that does not own CIP-014 R1 applicable substations?

Comment

We request clarification of the proximity requirement to be physical distance of ½ mile, not electrical distance.

We request clarification of acceptable proximity obstruction exclusions such as trees, buildings, highway, etc.

Clarify that if an adjacent substation is radial from the substation under study, it is not applicable.

Comment	

NextEra supports the comments provided by EEI below:

EEI provides the following revisions for consideration:

EEI suggests striking Requirement R2, Part 2.2. The Project Scope described in the SAR for Project 2023-06 does not include ease of access as a needed revision to CIP-014-3 but does explicitly include line-of-sight. Ease of access from a common public roadway may be an appropriate consideration in some scenarios, but it is not appropriate in all cases such as rural scenarios where a common public roadway or common roadway does not exist between stations or where an alternative such as the transmission right of way are more likely access paths. The inclusion of the ½ mile distance and line-of-sight requirement address the primary objectives in the SAR, and the “shall address at a minimum” language provides flexibility to consider additional criteria.

Additionally, EEI is concerned with the inclusion of the “irrespective of ownership” language in Requirement R2 because it is not possible to compel non-registered entities, or registered entities that are not subject to CIP-014 to share the information required by the proposed Standard. While we do not have revised language to recommend, we ask the drafting team to consider ways to manage differing ownership that are scoped to registered entities who must comply with CIP-014, or to make revisions that provide flexibility by allowing the Transmission Owner to determine how to manage differing ownership as part of their criteria or methodology.

EEI asks the drafting team to consider adding examples or explanations to the technical rationale describing:

a. ½ mile distance – Please add a justification for selecting ½ mile as the appropriate distance. Clarify if the drafting team intended for the distance to be based on driving distance, or as the crow flies.

b. Line of sight – Please clarify by adding examples of how to apply this. For example, if an entity performed site visits during the summer, line of sight could be impacted by trees/vegetation during the summer that would not impact line of sight during the winter.

Dave Krueger - SERC Reliability Corporation - 10	
Answer	No
Document Name	

Comment
SERC appreciates the ongoing efforts to refine the CIP-014 Risk Assessment portion of the standard. As commented in previous ballots, SERC believes the removal of subrequirement 2.1 would provide additional clarity as those elements are difficult to measure and may change seasonally and over time, and create an uncertain mix of objective and subjective criteria. SERC also believes that further clarity could be added to the ½ mile threshold in R2, to clarify that ½ mile is the distance between closest substation fencelines or Elements – as some large EHV substations may have nearly ¼ mile or more of fenceline among one side.

Additionally, they have removed requirements R2.1 and R2.2, which pertained to line-of-sight and ease of access.

The information required from proximate substations can be gathered from other sources (GIS maps, models, etc.) if the proximate facility owner does not provide information and as such, determination of "irrespective of ownership" in the proposed standard is achievable.

Lucinda Bradshaw - Lucinda Bradshaw On Behalf of: Byron Booker, Oncor Electric Delivery, 1; - Lucinda Bradshaw

Answer	No
Document Name	

Comment

Oncor does not agree that the modifications made in CIP-014-4 Requirement R2 to address the issues identified in the SAR because the proposed sub-requirements in R2 are still ambiguous and fail to create the consistent approach in the identification of infrastructure critical to the operation of the BPS as sought with the SAR. Due to varying geographical locations of facilities and the overall flexibility to document the criteria used to determine proximity, inconsistencies in approaches to perform risk assessments will remain. We recommend that R2.1 and R2.2 be replaced with specific and measurable criteria. For example, the Director of National Intelligence Joint Counterterrorism Assessment Team (JCAT) has published bomb threat standoff distances in which the mandatory evacuation distances for an SUV/VAN explosive threat is 400 feet. Guidelines such as these are used by Physical Security Professionals when performing the evaluation required by CIP-014-3 R6. For consistency, we recommend that a distance between 400 feet to 1000 feet be specified in CIP-014-4 R2.

Additionally, we request clarification of the proposed R2 language concerning voltage classes applicable to stations in proximity. While the proposed R2 language points to R1 stations concerning proximity, and R1 points to Attachment 1, in which lines less than 200 kV are not applicable, it is unclear that the same "less than 200 kV" exclusion applies to those facilities that are in physical proximity to facilities to which R1 is applicable. We request that R2 be clarified to state that only facilities above 200 kV and in proximity to applicable facilities under R1 are to be considered.

As revised, R2 now places the burden on a Transmission Owner ("TO") to track those Transmission stations and Transmission substations that are within ½ mile of that TO's own Transmission station or Transmission substation even if they are *owned by other parties*. Not all TOs willingly disclose the exact location of their stations or substations, and some consider the geographic locations of their stations and substations to constitute CEII. Both of these scenarios will impede a TO's ability to obtain the necessary location information. In addition, this proposed approach could present significant issues for entities that are in competition with one another, which is the case in certain areas of Texas in which multiple entities are certificated to provide service in the same geographic area or in areas containing numerous Transmission stations or Transmission substations owned by various entities in close proximity.

We also point out that the language in R2 "that could be impacted by a single physical attack" is too vague and could create significant disparities in how threat assessments are performed in accordance with R2. Under CIP-014-4 R2, each TO would be responsible for determining what an "impact" is and when it could occur. As a result, this vague requirement may create challenges when stations or substations are within the same line of sight from a single location or share access from a common roadway, but are owned by different entities. If those different TO are not aligned in how "impact" is determined and the procedures and processes implemented to ensure compliance with CIP-014-4 R2, then disagreements between those entities on whether their stations or substations could have been impacted by a single physical attack could arise. Such disagreements could make determining compliance with CIP-014-4 R2 for each of the disagreeing entities particularly difficult.

The intent of the requirement is understood and appreciated. However, the nature of the “single physical attack” needs clarification. Interpretations of this attack can range from events where elements are lost with some time delay between failures (gun shots for example) to a simultaneous loss of all elements (large explosion?). Clarity on the nature of the physical attack or parameters that can be applied to define the attack are needed to avoid differing interpretations of what event is to be studied and how this requirement is to be audited.

Additionally, this guidance is appropriately located in the TPL space to clarify to planning entities what type of extreme event needs to be evaluated and subsequently communicated to the Transmission Owner.

Comment

This particular requirement does not identify a need for a TO with facilities that meet the requirement to inform an adjacent TO (i.e., a TO that is a different owner) who's facilities fall under the distance identified under R2. It seems unreasonable for a TO to have to assess another TO's facilities or know if their future plans would create an impact to them due to proximity of where the facility is installed. LIPA would suggest adding language requiring TO's who identify facilities under R2 to coordinate and notify adjacent TO's in support of their own assessment.

There is also a concern in the event two different entities disagree with a line of sight risk assessment. We suggest adding a common form and/or process to reconcile CIP-014 line of sight assessments / disagreements so to avert non-compliance by either entity.

We would recommend issuing formal guidance on a "line of sight" and "common roadway" and how to assess those two terms.

Comment	
The intent is to identify close physical proximity such that a singular event could impact both stations; other ranges are irrelevant. **Emphasize explicitly in the standard language or Guidelines and Technical Basis that this considers only a single, simultaneous attack**. Considering non-simultaneous attacks makes the number of scenarios infinite and is not feasible to analyze or protect against.

BPA recognizes a significant improvement in the language of R2, however BPA finds the proximity text is still highly subjective. BPA asks "What does the process look like when one Registered Entity brings in owners of other facilities?" BPA sees a potentially dramatic increase in modeling concerns considering multiple Facilities owned by multiple entities. BPA believes there is insufficient detail about expected actions when new Facilities are added due to proximity and recommends adding clarity to the expected actions. As an example, when a new facility is added, a study should be conducted with the option of ruling out the criticality of the new facility. Finally, BPA believes the intent of CIP-014 is changing from identifying a very small number of absolutely critical substations to requiring Registered Entities to expand their lists due to proximity.

Comment	

NV Energy appreciates the addition of the ½ mile bright line criteria to remove ambiguity and subjectivity.

NV Energy requests that the SDT provide clarity on the following items:

Clarify in the rationale that the Transmission stations within a ½ mile of an applicable Transmission station is based on distance “as the crow flies” and not electrical distance.

Clarify using examples of what are acceptable proximity exclusion obstructions such as trees, buildings, highway, etc. or is this up to each individual assessment criteria?

Clarify in the rationale if an adjacent substation is radial from the substation under study, then it is not applicable. Add examples to the rationale to address the various scenarios involving a substation under study and any adjacent substations meeting the ½ mile proximity. For example: Are they faulted simultaneously or individually with or without the same damage or inoperability? Are these questions up to each individual assessment methodology?

Texas RE recommends R2 be clarified to state “within ½ mile of **straight areal distance from** an applicable transmission station or transmission substation documented in Requirement R1.	
Likes 0	
Dislikes 0	
Response	

Thank you for your comment.

The Drafting Team has reduced the separation requirement, added clarification on the reference point for measurement and added language in the Technical Rationale to explain the reason for the chosen distance. Additionally, they have removed requirements R2.1 and R2.2, which pertained to line-of-sight and ease of access.

3. Do you agree with the modifications made in CIP-014-4 with new Requirement R3 to address the issues identified in the SAR?

Kevin Conway - Western Power Pool - 4

Answer	No
Document Name	

Comment

The loss of any single substation under R3 is essentially studied as part of the TPL standards yearly. The R3 requirement should be limited to those facilities identified in R2. This avoids duplication of other standards and work, especially for smaller organizations that do not have dedicated planning staff.

Transmission Owners do not have planning staff to do steady-state and dynamic studies, that is a Transmission Planner function. Transmission Owners are responsible to build and maintain transmission assets. R3 should be focused on Transmission Planners to complete these studies and distribute them to the TO entities to implement action plans when there are negative findings. TOs should be required to provide information needed to the Transmission Planners so the studies can be relevant and accurate.

Likes 0	
Dislikes 0	

Response

Thank you for your comments. While similar, the event studied in CIP-014 is different from the NERC Category P5 contingency studied in TPL-001-5. For instance, TPL-001 contingencies due to unspecified causes, whereas CIP-014 is focused specifically on physical attacks. Additionally, TPL-001 focuses on system reliability, whereas CIP-014 focuses on the reliability and stability of an Interconnection. For these reasons alone, the DT believes that the assumptions for each should be separate and distinct from each other.

The addition of Transmission Planner to the Applicability section is outside of the scope of the Project 2023-06 SAR.

Erin Wilson - NB Power Corporation - New Brunswick Power Transmission Corporation - 5

Comment

We recommend removing the word “proximity” and making it consistent with R2 wording.

We recommend the SDT to consider that planning and simulation studies (Part 3.1) are not solely be located in a physical security standard regardless of how load is lost (hurricane, fire, earthquake, physical attack, etc.)

We also recommend removing “proximity” from 3.3 and make it consistent with the rest of the standard.

Likes 0	
Dislikes 0	

Response

Thank you for your comment.

The use of “proximity” in requirement R3.3 is not intended to define a term but is used only in a descriptive sense.
The DT believes that the word “proximate” in Requirement R2 and the word “proximity” in Requirement R3 are in agreement.

The scope of this standard is limited to physical security.

A suggestion for R3.1: As currently written the terms "instability, uncontrolled separation, or Cascading within an Interconnection" are unclear within the context of a given Entity and do not provide a solid basis for the Entity to implement their program or for oversight to compare. MRO recommends that the Entity be required to define these terms in the context of the studies within their system and to identify criteria when "instability, uncontrolled separation, or Cascading within an Interconnection" occur.

A suggestion for R3.2: MRO finds the term "more likely to contribute" to be vague and subjective. Consider enhancing by adding the requirement to document the rationale for the condition selections; for example justification based on historical events, and conditions identified in other studies.

The proposed language for R3.3 motivates MRO's negative vote on this draft. Specifically, the use of the term "fault" opens the door to the usage of less severe faults. We recommend changing "fault" to "a fault that will cause the most severe consequences at that substation" to ensure the most serious scenario is studied. We believe the currently drafted language will reduce the effectiveness of the standard.

Likes 0	

Dislikes 0	

Response

Thank you for the comment.

The Drafting Team has reduced the level of specificity with regard to reliability criteria based on numerous comments from industry and thus chose not to define instability, uncontrolled separation, or Cascading.

“More likely to contribute” has been removed from the standard.

The DT believes that simulation of a fault is a reasonable assumption for possible events that could impact a single Transmission station or Transmission substation, and for events that could simultaneously impact multiple Transmission stations or Transmission substations. The DT does not believe that specification of fault type (e.g., 3-phase faults or single-line-to-ground faults) was mandated by the SAR, and furthermore believes that such a specification is a) too prescriptive and b) potentially creates scenarios that do not match up with plausible threat vectors assessed and managed by corporate security personnel complying with CIP-014 Requirements R7 – R10. The DT furthermore believes that simulation of a no-fault event is not a reasonable assumption for physical attacks under CIP-014. While plausible, no-fault events are not in keeping with the direction of the SAR.

Comment

The ‘line-of-sight’ and ‘ease of access’ term usage concerns mentioned in comment section 2 above also applies to R3 since R3.3 refers to R2 station applicability. However, edits to R3.4.2 appear to provide more flexibility to entities and are an improvement from the previous draft version.

Likes 0	
Dislikes 0	

Response

Thank you for the comment. The DT agreed with the industry that the terms “Line of sight” and “ease of access” are too vague, therefore these terms have been removed from the standard. Instead, the DT clarified the issue of proximity in Requirements R2 and R3.

James Keele - Entergy - 3

Answer	No
Document Name	

Comment

[R3.3] states the analysis should include a fault at the R1 applicable station and a fault at any proximate R2 station. [R3.4] states the fault simulation should assume loss of communication and protection system at the station being studied. Existing language is not clear whether one is to assume loss of protection system on only the proximate facility or both the applicable and proximate facility at the same time.

Adrian Lazo:

[R3.4.2.] Consider removal of the word “more” in requirement. “More conservative” implies the actual clearing times are known and you then assume a more conservative value. However, you would use a conservative estimate when the actual clearing times are not known.

3.4.2. Actual or more conservative estimates of clearing times shall be used unless otherwise technically substantiated.

Adrian Lazo:

[R3.2.2.] Adding unstable generators tripped from the dynamic stability study to the steady-state contingency definition would create overly conservative results. Historically, both studies have been done in parallel and not directly informed each other.

Steady-state studies typically assume constant power loads where power does not vary with changes in voltage magnitude. This is a valid assumption for steady state studies but in reality, loads do not behave this way and differs greatly from how loads are represented in dynamic studies.

For dynamic studies the composite load model (CMLD) has seen increased adoption among utilities and more accurately reflects the aggregate behavior of motors. The model includes parameters which dictate fractions of the motor load components that do not restart, even if voltage recovers above the undervoltage trip thresholds. There is currently no industry consensus on whether this fraction of non-restart able motor loss is consequential or non-consequential load loss. Entergy’s stance is that this is consequential load loss as it’s impossible to prevent and would occur even for normally cleared faults due to typical undervoltage time delays of 2-3 cycles. Consequential load loss is commonly excluded from steady-state load loss criteria.

In summary, reflecting tripped generators from the stability study to the steady-state study would only make sense if loads were also reduced by the fraction of non-restart able motor loss. This would be extremely tedious as there is currently no practical way to achieve this with the tools available to Transmission Planners. There may be other issues that may need to be considered. Removal of the “including any tripped elements from dynamic simulations” language or a written exclusion for unstable generators should be considered.

Likes 0	
Dislikes 0	

Response

The DT believes that the language as currently proposed is appropriate. While there are commonly used generic clearing times for remote clearing that are consistent across the industry, actual clearing times can be shorter or longer depending on conditions and design considerations at an individual Transmission Owner. The difference of a few cycles can have a significant impact on the transient behavior of generating units, therefore, it is required that the risk analysis use actual or more conservative clearing time. Please see the Technical Rationale for further clarification.

Requirement R3.2.2 was removed from the standard.

Joshua London - Eversource Energy - 1, Group Name Eversource

Answer	No
Document Name	

Comment

Eversource has concerns with the phrase “other unacceptable post-event response within an Interconnection” in R3.1.1. A Transmission Planner may not know what is considered acceptable post-event response for an entire Interconnection. Direction on how to coordinate with the entire Interconnection or a minimum expectation should be provided. For example, Eversource is located in ISO New England; ISO New England may have certain acceptable frequency of 58 Hz but Pennsylvania may have a stricter 59 Hz limit, unbeknownst to the Transmission Planner. Another example

would be power flow, where an acceptable amount of generation loss would not be known for an entire Interconnection, as impacts could occur outside the TP's immediate area.

Comment

1. Please either remove 3.1.1 or merge it into 3.1.
2. The phrase “other unacceptable post-event response within an interconnection” in 3.1.1 should be limited to instability, uncontrolled separation, or Cascading. This phrase is too open ended and ill-defined. It is enough to now be adding generation loss and load loss to the instability, uncontrolled separation, and Cascading of the approved version. The SDT now has five measures of station criticality; there is no need to open the door for more. Therefore, please replace this phrase with “instability, uncontrolled separation, or cascading” or remove it entirely.
3. For clarity, we suggest expanding 3.1 to a numbered list as follows: “Technically supported thresholds and rationale for determining: 3.1.1 the amount of acceptable load loss, 3.1.2 the amount of acceptable generation loss, 3.1.3 post-event response resulting in instability having a critical impact on the operation of the interconnection, 3.1.4 uncontrolled separation, and 3.1.5 Cascading”
4. The phrase “System conditions that are more likely to contribute” in 3.2 is too open ended and ill-defined. Please replace this with “one System peak load case or System off-peak load case, whichever may be more likely to contribute...”
5. 3.2.2. Feeding dynamic outages into steady state cases will lead to significant nonconvergence issues in steady state if applied in the contingency or even if a base case is created with these outages because the appropriate timing delay cannot be reflected. If outages are applied individually and manually post-contingency this will be a significant increase in the burden of the steady state analysis.

Thank you for your comment.

1. Requirement R3.1.1 has been removed from the standard.

2. “Other unacceptable post-even response…” language has been removed from the standard.

3. Requirement R3.1 has been revised. Please see proposed changes.

4. The DT has removed the phrase and modified the sub-Requirement as: A provision that steady-state and dynamic simulations shall each be performed using a System peak Load case and a System Off-Peak Load case.

5. Requirement R3.2.2 has been removed from the standard.

Ben Hammer - Western Area Power Administration - 1

Answer	No
Document Name	

Comment

Please consider language that is clear/specific regarding what is required, at a minimum, to meet the requirements of the standard. Having language in a requirement saying “and any additional considerations recognized as” and “that are more likely to” are too general and broad. This introduces challenges, inconsistencies, and confusion regarding what specifically must be considered in order to meet compliance with the requirement.

Suggested language is provided below. Reordering of the subparts of Requirement R3 should be considered depending on the language that is ultimately chosen.

R3. Each Transmission Owner shall have a documented risk assessment methodology for evaluating the loss due to a physical attack of each applicable Transmission station(s) and Transmission substation(s) documented in Requirement R1 and Transmission substation(s) or Transmission station(s) determined to be in proximity per Requirement R2. The methodology shall include, at a minimum, the following:

3.1. Technical rationale for determining the amount of acceptable post-event load loss and generation loss.

3.2. The criteria or methodology used to identify instability, uncontrolled separation, or Cascading within an Interconnection.

3.3 Rationale for the System conditions selected for performing the studies.

3.4 For each applicable Transmission station or Transmission substation listed in accordance with Requirement R1, analysis shall include the following:

3.4.1. A Fault at the applicable Transmission station or Transmission substation and each Transmission station or Transmission substation identified in accordance with Requirement R2 as being in proximity to the applicable Transmission station or Transmission substation.

3.4.2. The removal of all Elements that the Protection System and other automatic controls are expected to disconnect for each event.

3.4.3. Steady-state simulations shall include any additional tripped Elements identified from the dynamic simulation of an event.

3.4.4. Dynamic simulations that assume the loss of communication and the Protection System at the Transmission station(s) or Transmission substation(s) shall use the following:

3.4.4.1 Delayed (remote-end) clearing times unless otherwise technically substantiated.

3.4.4.2 Actual or more conservative estimates of clearing times unless otherwise technically substantiated.

Likes 0	
Dislikes 0	

Response

Thank you for your comment. The DT believes that the majority of these suggestions are organizational rather than substantial. In particular, the DT notes that Western Area Power Administration's proposed R3.4 and R3.4.1 do not adequately address how to simulate fault scenarios for both lists identified as part of Requirements R1 and R2, and for that reason the DT has elected to proceed with the 3rd draft Requirement R3 as posted. Please see the latest Requirement R3 language and the latest Technical Rationale document for additional detail.

Gary Trezza - Long Island Power Authority - 1 - NPCC

Answer	No
Document Name	

Comment

a) We recommend removing the word “proximity” from R2 and R 3.3 and making the wording consistent with the R2 wording.

b) The wording for R3.2, R3.3 and R3.4 is written a little out of context with the intent of R3, which is to develop a documented risk assessment methodology. It is recommended to consider moving R3.2, R3.3 and R3.4 to be sub-requirements of R5.

Likes 0	
Dislikes 0	

Response

Thank you for your comment.

The use of “proximity” in requirement R3.3 is not intended to define a term but is used only in a descriptive sense. The DT believes that the word “proximate” in Requirement R2 and the word “proximity” in Requirement R3 are in agreement.

Requirements R3.2, R3.3 and R3.4 should be defined in the methodology before they're studied as part of the R5 risk assessment.

Additional clarity (explanation) is requested for R3, 3.3 regarding the intent of the language for analysis that includes a Fault ("…analysis shall include a Fault at the applicable Transmission station…") since there could be different interpretations within the industry.

Likes 0	
Dislikes 0	

Response

Thank you for your comment. Due to the comments received from the industry from the previous ballot, the DT has removed the specificity regarding the type of Fault to apply.

Matt Carden - Southern Company - Southern Company Services, Inc. - 1

Answer	No
Document Name	

Comment

Southern Company appreciates the efforts the drafting team made to add flexibility to the simulation of a physical attack as it pertains to Requirement R3.3. However, the SAR differentiates the CIP-014 assessment from other planning assessments in that "the risk assessment requires the entire transmission station to be considered as rendered inoperable or damaged as the result of physical attack rather than just particular elements electrically connected to a single electrical disturbance."

Southern Company requests the SDT add more clarity to Requirement R3.3 to address this portion of the SAR while still maintaining some flexibility that was evident in this draft. Otherwise, we are concerned the industry will have vastly different interpretations of this requirement that lead to inconsistency in analysis and verification.

Likes 0	
Dislikes 0	

Response

Thank you for your comment. Please see the DT's response to the MRO NSRF comments. Greater specificity for this requirement was rejected in the previous ballot.

Amy Wesselkamper - PNM Resources - Public Service Company of New Mexico - 3

Stephen Stafford - Stephen Stafford On Behalf of: Greg Davis, Georgia Transmission Corporation, 1; - Stephen Stafford

Answer	No
Document Name	

Comment

Developing steady-state and dynamic simulation criteria is a planning function and should not be required of a Transmission Owner. The sub-requirements go further into addressing what a transmission planning study should include but applies this requirement incorrectly to the Transmission owner. The intent of R3 is more appropriately applicable to the TPL body of standards. CIP-014 should reference output from a study performed in accordance with a clearly defined TPL requirement for an extreme event involving the loss of an applicable Transmission station(s) or substation(s).

CEHE supports EEI's comments for requirements 3.1 and 3.3. In addition, CEHE has concerns with planning assessments to simulate "the loss of communications and system protection" as listed in Requirement 3, part R3.4. CEHE believes it is an unnecessary burden on TPs, where now TPs are required to perform steady state assessments but also stability simulations. The loss of any single substation under R3 is already studied annually as part of TPL standards. Requirement R3, Part 3.2.2 goes beyond the scope of what is documented in the SAR by requiring additional steady-state analysis after the steady-state and dynamic simulations show acceptable system response. The SAR specifically states that "[t]o ensure that a station is effectively identified as non-critical, registered entities need to have performed both steady-state and dynamic studies" but does not go into further detail about performing another steady-state analysis that includes any tripped Elements from the dynamic simulations. We suggest striking Requirement R3, Part 3.2.2.

The referenced “System conditions that are more likely to contribute to instability, uncontrolled separation, or Cascading within an Interconnection” mentioned in R3.2 need to be clarified. In ERCOT, a TO can explain why it selected the study cases it did, but each utility can only select those cases based on its experience with its own system. If there are specific “System conditions” that need to be studied, those “System conditions” should be specified and explained in R3.2.

EEI proposes the following revisions for consideration: The term “proximity” is not used in Requirement R2. EEI suggests removing it from Requirement R3 and its sub parts. R3. Each Transmission Owner shall have a documented risk assessment methodology, including criteria for steady-state and dynamic simulations, for evaluating the loss due to a physical attack of each applicable Transmission station(s) and Transmission substation(s) documented in Requirement R1	

and Transmission substation(s) or Transmission station(s) determined per Requirement R2. The methodology shall include, at a minimum, the following:

Requirement R3, Parts 3.1 and 3.1.1 include duplicative concepts that could lead to confusion implementing and/or documenting the requirement parts. As an example, Requirement R3 requires the Transmission Owner to have a documented risk assessment methodology, including criteria for steady-state and dynamic simulations. Requirement R3, Part 3.1 requires the methodology to include technically supported thresholds and rationale, and Part 3.1.1 restates the requirement for the technical rationale to include steady-state and dynamic system response to events. EEI suggests consolidating the requirement parts as written below:

3.1 Technically supported thresholds and rationale for determining the amount of acceptable load loss, the amount of acceptable generation loss post-event response, and any additional considerations recognized as resulting in instability, uncontrolled separation, or Cascading within an Interconnection.

Requirement R3, Part 3.2.2 goes beyond the scope of what is documented in the SAR by requiring additional steady-state analysis after the steady-state and dynamic simulations show acceptable system response. The SAR specifically states that "[t]o ensure that a station is effectively identified as non-critical, registered entities need to have performed both steady-state and dynamic studies" but does not go into further detail about performing another steady-state analysis that includes any tripped Elements from the dynamic simulations. We suggest striking Requirement R3, Part 3.2.2.

Requirement R3, Part 3.3 could be further clarified and reference to proximity should be removed in favor the reference to R2, we suggest the following language:

3.3 For each applicable Transmission station or Transmission substation listed in accordance with Requirement R1, analysis shall include a Fault **in the simulation** at the applicable Transmission station or Transmission substation and **then at** each Transmission station or Transmission substation identified in accordance with Requirement R2.

Requirement R3, Part 3.4 is not clear as written. If the intention of the drafting team is for 3.4 to require fault simulations that assume the loss of communication and Protection System at all of the Transmission station(s) or Transmission substation(s) studied under Requirements R3, Parts 3.2 and 3.3 simultaneously, we suggest the following revision:

3.4. Fault simulations that assume the loss of communication and Protection System at **all of** the Transmission station(s) or Transmission substation(s) studied under Requirement R3, Parts 3.2 and 3.3.

EEI appreciates that drafting team's revision to Requirement R3, Part 3.4.2 to provide flexibility in the clearing times used, however, by stating "Actual or more conservative" entities will still need to calculate the actual clearing times in order to validate that the estimates are more conservative. We suggest:

3.4.2. Actual or conservative estimates of clearing times shall be used unless otherwise technically substantiated.

Response

Thank you for your comment.

The use of "proximity" in requirement R3.3 is not intended to define a term but is used only in a descriptive sense.

Requirement R3.1.1 has been removed from the draft standard.

Requirement R3.2.2 has been removed from the draft standard.

Modifications and clarifications have been made to Requirements R3.3 and R3.4. Please see draft standard.

The DT believes that “more” is a necessary clarifying term in Requirement R3.4.2. While there are commonly used generic clearing times for remote clearing that are consistent across the industry, actual clearing times can be shorter or longer depending on conditions and design considerations at an individual Transmission Owner. The difference of a few cycles can have a significant impact on the transient behavior of generating units, therefore, it is required that the risk analysis use actual or more conservative clearing time

Jennie Wike - Jennie Wike On Behalf of: John Merrell, Tacoma Public Utilities (Tacoma, WA), 1, 4, 5, 6, 3; - Jennie Wike, Group Name Tacoma Power

Answer	No
Document Name	

Comment

Tacoma Power supports the changes. However, there does not appear to be an existing requirement within TPL-008, TPL-001, or MOD-032 for a TO with a non-applicable substation to provide sufficient detail about backup relaying schemes to an adjacent TO in order to fulfill R3.2.1. We recommend the standard drafting team ensure there is adequate access to relaying information via a request chain from the TO to PC to adjacent PC to TO.

Response

Thank you for your comment. NERC standard PRC-027 has similar requirements around communication and coordination of protection settings. Given this, the DT believes that it is appropriate to require similar details for CIP-014.

Dave Krueger - SERC Reliability Corporation - 10

Answer	No
Document Name	

Comment

SERC appreciates the ongoing efforts to refine the CIP-014 Risk Assessment portion of the standard. SERC believes the elimination of the specific details in previous requirements 3.4 and 3.5 and the use of the single word ‘fault’, that the standard has drifted from having clarity and consistency in the requirements of how such extreme events are simulated across different utilities, contrary to the specificity mentioned in SAR Scope item 3 and without

explanation in the Technical Rationale for the change. There is also no visible consideration or measurement of the reliability risks of excluding certain fault types from these forward-looking studies, nor an ongoing mechanism in R3.3 for historic analysis of faults as proposed by some other commenters.

Likes 0	
Dislikes 0	

Response

Thank you for the comment. The DT does not agree with specifying or excluding certain Fault types to be studied, or with requiring historic analysis of Faults.

Comment

NextEra supports the comments provided by EEI below:

EEI proposes the following revisions for consideration:

The term "proximity" is not used in Requirement R2. EEI suggests removing it from Requirement R3 and its sub parts.

R3. Each Transmission Owner shall have a documented risk assessment methodology, including criteria for steady-state and dynamic simulations, for evaluating the loss due to a physical attack of each applicable Transmission station(s) and Transmission substation(s) documented in Requirement R1 and Transmission substation(s) or Transmission station(s) determined to be in proximity per Requirement R2. The methodology shall include, at a minimum, the following:

Requirement R3, Parts 3.1 and 3.1.1 include duplicative concepts that could lead to confusion implementing and/or documenting the requirement parts. As an example, Requirement R3 requires the Transmission Owner to have a documented risk assessment methodology, including criteria for steady-state and dynamic simulations. Requirement R3, Part 3.1 requires the methodology to include technically supported thresholds and rationale, and Part 3.1.1 restates the requirement for the technical rationale to include steady-state and dynamic system response to events. EEI suggests consolidating the requirement parts as written below:

1.1 Technically supported thresholds and rationale for determining the amount of acceptable load loss, the amount of acceptable generation loss post-event response, and any additional considerations recognized as resulting in instability, uncontrolled separation, or Cascading within an Interconnection. The technical rationale shall include:

1.1.1 Steady-state and dynamic system response to events that could lead to load loss, generation loss, and other unacceptable post-event response

Requirement R3, Part 3.2.2 goes beyond the scope of what is documented in the SAR by requiring additional steady-state analysis after the steady-state and dynamic simulations show acceptable system response. The SAR specifically states that "[t]o ensure that a station is effectively identified as non-critical, registered entities need to have performed both steady-state and dynamic studies" but does not go into further detail about performing another steady-state analysis that includes any tripped Elements from the dynamic simulations. We suggest striking Requirement R3, Part 3.2.2.

Requirement R3, Part 3.3 could be further clarified and reference to proximity should be removed in favor the reference to R2, we suggest the following language:

3.3 For each applicable Transmission station or Transmission substation listed in accordance with Requirement R1, analysis shall include a Fault **in the simulation** at the applicable Transmission station or Transmission substation and **then at** each Transmission station or Transmission substation identified in accordance with Requirement R2 as being in proximity to the applicable Transmission station or Transmission substation.

Requirement R3, Part 3.4 is not clear as written. If the intention of the drafting team is for 3.4 to require fault simulations that assume the loss of communication and Protection System at all of the Transmission station(s) or Transmission substation(s) studied under Requirements R3, Parts 3.2 and 3.3 simultaneously, we suggest the following revision:

3.4. Fault simulations that assume the loss of communication and Protection System at **all of** the Transmission station(s) or Transmission substation(s) studied under Requirement R3, Parts 3.2 and 3.3.

EEI appreciates that drafting team's revision to Requirement R3, Part 3.4.2 to provide flexibility in the clearing times used, however, by stating "Actual or more conservative" entities will still need to calculate the actual clearing times in order to validate that the estimates are more conservative. We suggest:

3.4.2. Actual or more conservative estimates of clearing times shall be used unless otherwise technically substantiated.

Comment

Please provide more specificity around the clearing times referenced in R3.4. The phrase "more conservative estimates" is vague as it opens the door to different interpretations by various entities. A specific timeframe should be specified in cycles to clarify the intent of the Standard.

There are two issues to consider, both being identified during a compliance audit. One issue considers loss of communications at the primary substation, and the other considers any adjacent or proximate substations.

First, is the simulation intended to have a communication outage prior to a fault or simultaneous with the fault, and if not simultaneous how far in advance of the fault is the communications outage expected to occur (this issue was a point of contention during an audit)? Please clarify the language of the Standard regarding loss of communications for protection schemes and the timing of loss of communications between multiple substations.

Second, regarding timing of loss of communications at adjacent substations, if an assessment methodology allows for pilot schemes to trip high speed without communications such as DCB lack of blocking signal or DCUB unblocking schemes when the guard signal is lost during the trip window allowing a highspeed trip this is technically substantiated.

Additionally, the assumption of a simultaneous fault and/or loss of communications on each element of two adjacent substations, potentially up to ½ mile apart, seems impossible to technically justify and should not be required for the risk assessment.

Please reconcile the phrase “more likely to contribute” in Requirement 3.2 with the phrase in 3.4, “technically substantiated”. Using the terminology “more likely” seems to invalidate any conditions that are “technically substantiated”, allowing nothing less than the instantaneous complete destruction of multiple substations. This is impractical.

The NERC report on CIP-014 noted that NERC finds that the inconsistent approach to performing the risk assessment is largely due to a lack of specificity in the requirement language as to the nature and parameters of the risk assessment. Is it more likely all systems are inoperable or more likely just a few systems are inoperable? Several scenarios could exist which seems subjective and will still result in inconsistent approaches.

Please add examples of various scenarios to address these issues.

Dislikes 0	

Response

Thank you for the comment. The draft standard allows Transmission Owners to use actual clearing times, which addresses the greater specificity requested in the comment. Clearing times are often specific to individual Transmission Owners so the DT believes it would be inappropriate to prescribe them in this standard.

Requirement R3.4 has been modified to address the comments in paragraphs 2 through 4

The DT has reduced the distance requirement in Requirement R2 which addresses this comment.

“More likely” has been removed from the draft standard.

The DT believes they have added adequate specificity to address the directives of the SAR.

Comment

A 36month frequency of this standard has a shorter time cycle than some entities broader system studies which determine cascading, uncontrolled separations etc… in many regions the RC or ISOs perform these studies and provide results to the TO for use in CIP-014. These entities must also have to adjust their study cycle (which is very onerous) OR suggestion is to add a statement in the standard that allows the TO use their discretion with RC to use the most recent studies available.

Likes 0	

Dislikes 0	

Response
Thank you for the comment. The SAR requires the DT to align the different timelines and study cycles used in CIP-014-3. The 36 month frequency is longer than the 30 month frequency used in CIP-014-3.

R3.3 should specify a three phase Fault to ensure consistency in performing studies. Also, see response to Question 2.

Likes 0	
Dislikes 0	

Response
Thank you for the comment. The DT believes that simulation of a fault is a reasonable assumption for possible events that could impact a single Transmission station or Transmission substation, and for events that could simultaneously impact multiple Transmission stations or Transmission substations. The DT does not believe that specification of fault type (e.g., 3-phase faults or single-line-to-ground faults) was mandated by the SAR, and furthermore believes that such a specification is a) too prescriptive and b) potentially creates scenarios that do not match up with plausible threat vectors assessed and managed by corporate security personnel complying with CIP-014 Requirements R7 – R10. The DT furthermore believes that simulation of a no-fault event is not a reasonable assumption for physical attacks under CIP-014. While plausible, no-fault events are not in keeping with the direction of the SAR.

Comment

ITC proposes the following revisions for consideration:

The term “proximity” is not used in Requirement R2. ITC suggests removing it from Requirement R3 and its sub parts.

R3. Each Transmission Owner shall have a documented risk assessment methodology, including criteria for steady-state and dynamic simulations, for evaluating the loss due to a physical attack of each applicable Transmission station(s) and Transmission substation(s) documented in Requirement R1 and Transmission substation(s) or Transmission station(s) determined to be in proximity per Requirement R2. The methodology shall include, at a minimum, the following:

Requirement R3, Parts 3.1 and 3.1.1 include duplicative concepts that could lead to confusion implementing and/or documenting the requirement parts. As an example, Requirement R3 requires the Transmission Owner to have a documented risk assessment methodology, including criteria for steady-state and dynamic simulations. Requirement R3, Part 3.1 requires the methodology to include technically supported thresholds and rationale, and Part 3.1.1 restates the requirement for the technical rationale to include steady-state and dynamic system response to events. ITC suggests consolidating the requirement parts as written below:

{C}a. {C}Thresholds for determining the amount of acceptable load loss, the amount of acceptable generation loss, and post-event response recognized as resulting in instability, uncontrolled separation, or Cascading within an Interconnection. The technical rationale shall include:

{C} i. Steady-state and dynamic system response to events that could lead to load loss, generation loss, and other unacceptable post-event response

Requirement R3.2 ITC recommends that the phrase (that are more likely to contribute to) be deleted from the requirement. This is subjective and could lead to violations if your ERO disagreed with what you determined was not a more likely scenario as appropriate for your studies.

Requirement R3, Part 3.2.2 goes beyond the scope of what is documented in the SAR by requiring additional steady-state analysis after the steady-state and dynamic simulations show acceptable system response. The SAR specifically states that “[t]o ensure that a station is effectively identified as non-critical, registered entities need to have performed both steady-state and dynamic studies” but does not go into further detail about performing another steady-state analysis that includes any tripped Elements from the dynamic simulations. We recommend striking Requirement R3, Part 3.2.2.

Requirement R3, Part 3.3 could be further clarified and reference to proximity should be removed in favor the reference to R2, we suggest the following language:

3.3 For each applicable Transmission station or Transmission substation listed in accordance with Requirement R1, analysis shall include a Fault **in the simulation** at both the applicable Transmission station or Transmission substation and **at** each associated Transmission station or Transmission substation identified in accordance with Requirement R2 as being in proximity to the applicable Transmission station or Transmission substation.

Requirement R3, Part 3.4 is not clear as written. If the intention of the drafting team is for 3.4 to require fault simulations that assume the loss of communication and Protection System at all of the Transmission station(s) or Transmission substation(s) studied under Requirements R3, Parts 3.2 and 3.3 simultaneously, we suggest the following revision:

3.4. Fault simulations that assume the loss of communication and Protection System at **all of** the Transmission station(s) or Transmission substation(s) studied under Requirement R3, Parts 3.2 and 3.3. The TO shall identify the clearing times utilized for the required studies.

ITC recommends that both 3.4.1 and 3.4.2 are too prescriptive. An estimate of clearing times is typically used for dynamics studies to alleviate the administrative burden of identifying the expected clearing times for each specific scenario being analyzed.

ITC appreciates that drafting team’s revision to Requirement R3, Part 3.4.2 to provide flexibility in the clearing times used, however, by stating “Actual or more conservative” entities will still need to calculate the actual clearing times in order to validate that the estimates used were more conservative. We suggest the following if the DT believes this is essential:

3.4.2. Actual or more conservative estimates of clearing times shall be used.

Comment

NIPSCO agrees with EEI comments:

“The term “proximity” is not used in Requirement R2. EEI suggests removing it from Requirement R3 and its sub parts.

R3. Each Transmission Owner shall have a documented risk assessment methodology, including criteria for steady-state and dynamic simulations, for evaluating the loss due to a physical attack of each

applicable Transmission station(s) and Transmission substation(s) documented in Requirement R1 and Transmission substation(s) or Transmission station(s) determined per Requirement R2. The methodology shall include, at a minimum, the following:

Requirement R3, Parts 3.1 and 3.1.1 include duplicative concepts that could lead to confusion implementing and/or documenting the requirement parts. As an example, Requirement R3 requires the Transmission Owner to have a documented risk assessment methodology, including criteria for steady-state and dynamic simulations. Requirement R3, Part 3.1 requires the methodology to include technically supported thresholds and rationale, and Part 3.1.1 restates the requirement for the technical rationale to include steady-state and dynamic system response to events. EEI suggests consolidating the requirement parts as written below:

3.1 Technically supported thresholds and rationale for determining the amount of acceptable load loss, the amount of acceptable generation loss post-event response, and any additional considerations recognized as resulting in instability, uncontrolled separation, or Cascading within an Interconnection.

Requirement R3, Part 3.2.2 goes beyond the scope of what is documented in the SAR by requiring additional steady-state analysis after the steady-state and dynamic simulations show acceptable system response. The SAR specifically states that “[t]o ensure that a station is effectively identified as non-critical, registered entities need to have performed both steady-state and dynamic studies” but does not go into further detail about performing another steady-state analysis that includes any tripped Elements from the dynamic simulations. We suggest striking Requirement R3, Part 3.2.2.

Requirement R3, Part 3.3 could be further clarified and reference to proximity should be removed in favor the reference to R2, we suggest the following language:

*3.3 For each applicable Transmission station or Transmission substation listed in accordance with Requirement R1, analysis shall include a Fault **in the simulation** at the applicable Transmission station or Transmission substation and **then at** each Transmission station or Transmission substation identified in accordance with Requirement R2.*

Requirement R3, Part 3.4 is not clear as written. If the intention of the drafting team is for 3.4 to require fault simulations that assume the loss of communication and Protection System at all of the Transmission station(s) or Transmission substation(s) studied under Requirements R3, Parts 3.2 and 3.3 simultaneously, we suggest the following revision:

*3.4. Fault simulations that assume the loss of communication and Protection System at **all of** the Transmission station(s) or Transmission substation(s) studied under Requirement R3, Parts 3.2 and 3.3.*

EEI appreciates that drafting team's revision to Requirement R3, Part 3.4.2 to provide flexibility in the clearing times used, however, by stating "Actual or more conservative" entities will still need to calculate the actual clearing times in order to validate that the estimates are more conservative. We suggest:

3.4.2. Actual or conservative estimates of clearing times shall be used unless otherwise technically substantiated."

NIPSCO agrees with NV Energy comments:

The open-ended nature of "physical attack" results in very different interpretations of severity and subsequent protection system fault modeling results. This could be especially true depending on substation locations and inherent risk differences throughout the country. Clarify if the decisions to the questions above are left up to each company and their own assessment methodology?

Add examples to the rationale to address the various scenarios involving a substation under study and any adjacent substations meeting the ½ mile proximity. For example: Are they faulted simultaneously or individually with or without the same damage or inoperability? Are these questions up to each individual assessment methodology?

The Drafting Team has added clarity to Requirement R3 that addresses the NV Energy comments.

Kelley Sargent - Puget Sound Energy, Inc. - 3

Answer	No
Document Name	

Comment

The standard needs to be prescriptive on amount of load loss/generation loss that may impact an Interconnection (i.e. result in instability, uncontrolled separation or Cascading within an Interconnection). Sometimes loss of large spot loads (data centers etc.) may not represent a general wide area outage in an interconnection; and number of customers or area distribution substations may provide better representation of a wide area outage/blackout.

Likes 0	
Dislikes 0	

Response
The intent of the standard is to capture those situations where the loss of load or generation could result in instability, uncontrolled separation, or Cascading within an Interconnection. These load and generation thresholds may vary between Interconnections and thus are difficult to prescribe.

Thank you for your comments and support. Due to the comments received from the industry from the previous ballot, the DT has removed the specificity regarding the type of Fault to apply.

Dwanique Spiller - Berkshire Hathaway - NV Energy - 5	
Answer	Yes
Document Name	

Comment
NV Energy appreciates moving most of the granular specifications of R3.1 to the Technical Rationale. NV Energy would prefer that these were also removed from the Technical Rationale due to concern that an auditor may solely rely upon the Technical Rationale in interpreting R3.1 That could lead to circumstances in which an entity is held to compliance with the Technical Rationale rather than the actual language the of requirement." Requirement R3.2 states "Steady-state and dynamic simulations shall be performed under System conditions that are **more likely** to contribute to instability, uncontrolled separation, or Cascading within an Interconnection". Please reconcile the statement in 3.2 how "more likely to contribute to instability, uncontrolled separation, or Cascading" clarifies "technically substantiated" in requirement 3.4. Using terminology such as "more likely" seems to remove the possibility to technically substantiate anything less than complete destruction of multiple substations. This seems impractical. The NERC report on CIP-014 noted that NERC finds that the inconsistent approach to performing the risk assessment is largely due to a lack of specificity in the requirement language as to the nature and parameters of the risk assessment. For example, is the protection system "rendered inoperable" where no substation protection system would operate or instead just damaged where the secondary protection is inoperable but the primary still operates for the substation? Is it more likely all systems are inoperable or more likely just a few systems are inoperable? A huge number of scenarios could exist which seems very subjective and will still result in inconsistent approaches. Clarify if the decisions to these questions are left up to each company and their own assessment methodology? Note: remove or damaged due to being redundant due to "rendered inoperable" If an assessment methodology allows for pilot schemes to trip high speed without communications such as DCB lack of blocking signal or DCUB unblocking schemes when the guard signal is lost during the trip window allowing a highspeed trip, is this technically substantiated? Add some discussion in the technical rationale regarding loss of communications for protection schemes.

Likes 0	
Dislikes 0	

Response
Thank you for your comments and support. The DT understands your concern with the auditor's approach. However, the SAR calls out that the risk assessment methods for studying and methods should account for dynamic studies. The DT believes that this language belongs to the Standard, not the Technical Rationale Document. The DT has removed "more likely" from the current draft, and there is no longer a discrepancy between Requirement R3, Part 3.2 and Part 3.4.

Clarification on “rendered inoperable or damaged” is given in Requirement R3, Part 3.4.

Robert Jones - Seattle City Light - 4

Answer	Yes
Document Name	

Comment

The new R3 is acceptable, but we have a couple remaining concerns:

I'm still not sure how to determine "technically supported thresholds" for gen and load loss, outside of what results in " instability, uncontrolled separation, or Cascading." Are these intended to be seperate determinations?

In reference to 3.4 specifically, I appreciate the requirement being less prescriptive about how we run the study, but we have experienced disagreement with regulators about what type of physical attack we are supposed to simulating (i.e. "smoking crater" vs something more realistic). It would be nice to have some guidance here to help clear up the ambiguity so that we can choose the appropriate contingencies to run.

Likes 0	
Dislikes 0	

Response

Thank you for your comments and support.

The DT has removed the phrase "technically supported thresholds", however, it is prudent for each Transmission Owner to work with its respective Regional Entities to establish thresholds that, if exceeded, would be expected to cause instability, uncontrolled separation, or Cascading within an interconnection.

Regarding the type of physical attack, the DT believes that this issue is adequately addressed in the modeling requirements in Requirement R3.

Comment	
Texas RE is concerned the proposed Requirement Part 3.3 language does not specify the type of fault conditions (line-to-ground fault or three-phase fault) criteria that needs to be studied. Texas RE is also concerned with the use of the NERC Glossary definition of Fault, as it does not include line-to-ground faults or three-phase faults. Not defining the type of fault leaves it open for inconsistent applicability by the Transmission Owners. The drafting team should consider specifying the fault type to be used in the simulations to capture the highest risk conditions. At minimum, 'Fault' should not be	

capitalized, but a clear definition of the required “fault” conditions to be studied should be developed in the standard itself to avoid inconsistency in the compliance and subsequent auditing process.	
Likes 0	
Dislikes 0	
Response	
Thank you for your comments. The drafting team intends to include any event occurring on an electric system. No specific fault type needs to be called out.	

4. Do you agree with the modifications made in CIP-014-4 with new Requirement R4 to address the issues identified in the SAR?

Israel Perez - Israel Perez On Behalf of: Laura Somak, Salt River Project, 3, 6, 5, 1; Mathew Weber, Salt River Project, 3, 6, 5, 1; Thomas Johnson, Salt River Project, 3, 6, 5, 1; Timothy Singh, Salt River Project, 3, 6, 5, 1; - Israel Perez

Answer	No
Document Name	

Comment

Salt River Project (SRP) supports Duke Energy's comment to clarify “owned by multiple Transmission Owners” and clarification on having elements at a station or substation with differing ownership and whether that would make or not make a station or substation jointly owned.

Likes 0	
Dislikes 0	

Response

Thank you for the comments. Please see responses to Duke Energy’s comment. The drafting team has edited R4 for the third draft to provide additional clarification on the jointly owned issue, which was listed as part of the project work scope of the SAR.

Ellese Murphy - Ellese Murphy On Behalf of: Katherine Street, Duke Energy , 5, 6, 1, 1; - Ellese Murphy

Answer	No
Document Name	

Comment

Duke Energy requests additional clarification on “owned by multiple Transmission Owners” and requests that the team clarify that merely having elements at a station or substation with differing ownership would not make a station or substation jointly owned. If the Drafting team does intend thatelements from another Transmission Owner could classify a station or substation as “owned by multiple Transmission Owners”, what is the mechanism to ensure coordination occurs? Particularly if the visiting Transmission Owner does not have compliance in scope for CIP-014.

Likes 0	
Dislikes 0	

Response

Thank you for the comments. The drafting team edited R4 for the third draft to provide additional clarification on the jointly owned issue, which was listed as part of the project work scope of the SAR. Regarding the ensuring of coordination, the DT asserts that NERC Reliability Standards are not generally designed to guarantee this. For example, PRC-006-5 Requirement R5 requires coordination between multiple Planning Coordinators, with no mechanism in place to ensure such coordination will occur.

Gail Elliott - Gail Elliott On Behalf of: Michael Moltane, International Transmission Company Holdings Corporation, 1; - Gail Elliott

Answer	No
Document Name	

Comment

The inclusion of R4 is not identified as needed in the NERC CIP-014 Report nor in the SAR for the project. The inclusion of this requirement leads to a number of questions that have not been clarified. If For an entity that has a station with multiple voltage areas including some that are not applicable to CIP-014, how would an entity determine if this would be considered a joint station. If the second TO only has facilities that would not be applicable to CIP-014 within the substation, would they have to identify joint responsibilities for these sites.

If this requirement is retained, ITC believes it would be prudent to only consider the CIP-014 applicable voltages in the station to determine if it would be a joint station.

Likes 0	
Dislikes 0	

Response

Thank you for the comments. The drafting team edited R4 for the third draft to provide additional clarification on the "jointly owned" and "applicability" issues, which was listed as part of the project work scope of the SAR.

Jennifer Mcnally - Duke Energy - 1,3,5,6 - Texas RE,SERC,RF

Response

Thank you for the comments. The drafting team edited R4 for the third draft to provide additional clarification on the jointly owned issue, which was listed as part of the project work scope of the SAR. Regarding the ensuring of coordination, the DT asserts that NERC Reliability Standards are not generally designed to guarantee this. For example, PRC-006-5 Requirement R5 requires coordination between multiple Planning Coordinators, which involves effort on all involved registered entities to jointly discuss and develop the UFLS program design. Evaluating whether this coordination took place as specified by Requirement R5 would be accomplished by NERC and the Regional Entities through the Compliance Monitoring and Enforcement processes (e.g. Compliance Audit, Spot Check, Self-Report, etc.).

John Pearson - ISO New England, Inc. - 2

Answer	No
Document Name	

Comment

R4 should reference both R1 and R2. The modifed language is shown below:

Each Transmission Owner with applicable Transmission station(s) and Transmission substation(s) per Requirement R1 and R2 owned by multiple Transmission Owners shall coordinate with those Transmission Owners to determine and document their individual and joint responsibilities for performing any required risk assessments per Requirement R5. *[VRF: Medium; Time-Horizon: Operations Planning, Long-term Planning]*

Likes 0	
Dislikes 0	

Response

Thank you for the comments. The DT believes that existing R1 reference is sufficient, as it keeps R4 properly focused solely on Transmission Owners with applicability to CIP-014.

Lidija Efremova - Lidija Efremova On Behalf of: Emma Halilovic, Hydro One Networks, Inc., 1; - Lidija Efremova

Answer	No
Document Name	

Comment

This section refers to Transmission owners coordinating with other transmission owners. Further clarification is needed to address how TO should coordinate activities with a GO which are both in 'proximity' to each other. Which standards does a GO need to follow and how can this be enforced by a TO.

Likes 0	
Dislikes 0	

Response

Thank you for the comments. R4 applies solely to Transmission Owners. Proximity of Transmission Owners to Generator Owners thus has no CIP-014 applicability and furthermore is outside the scope of the SAR.

Jamison Cawley - Nebraska Public Power District - 1

Answer	No
Document Name	

Comment

Please provide additional details on the expected outcome of joint risk assessments. Is agreement of the results of the risk assessments between the entities required?

Likes 0	
Dislikes 0	

Response

Thank you for the comments. Regarding agreement of the results, the drafting team responds similarly to comments on a guarantee of coordination. No guarantee that coordination will occur without difficulty or that results will agree is possible. To the extent that agreement can be achieved, this is of course desirable. In the event that it cannot, each Transmission Owner should be able to technically justify its results using its own evidence.

Dave Krueger - SERC Reliability Corporation - 10

Answer	No
Document Name	

Comment

SERC appreciates the ongoing efforts to refine the CIP-014 Risk Assessment portion of the standard. SERC believes the coordination efforts in R4 should include R3 as well as R5, so that consistency and clarity in study results between multiple entity owners is maintained. In the case where all owners share the same R3 and R4 thresholds (such as in an RTO/ISO), only an acknowledgement of such would be needed to affirm consistency.

Likes 0	
Dislikes 0	

Response

Thank you for the comments. Requirement R4 has been modified accordingly.

Lucinda Bradshaw - Lucinda Bradshaw On Behalf of: Byron Booker, Oncor Electric Delivery, 1; - Lucinda Bradshaw

Answer	No
Document Name	

Comment

As written, the revised R4 appears to indicate that each TO that owns a part of a Transmission station or a Transmission substation identified pursuant to the assessment required in R1 should coordinate with those other TOs to determine their “individual and joint responsibilities” for performing any required risk assessments. It appears that the subject TOs could agree that each TO can prepare its own risk assessment of the subject station. If that is not what the SDT intended, then R4 needs to be clarified to affirmatively state more clearly what is intended.

It also appears that R4 does not require that each of the TOs that owns a part of a Transmission station or a Transmission substation must use the same methodology in preparing its required risk assessment. Again, if that is not what the SDT intended, then R4 needs to be clarified to make any methodological requirements clear.

Fundamentally, there are two inherent assumptions in the revised R4: (1) that it will always be possible for a TO to coordinate with all other TOs owning a Transmission station or a Transmission substation; and (2) that those TOs will always be able to agree on the responsibilities for preparing any required risk assessments. Unfortunately, that will likely not always be the case. To address this possibility, R4 should be revised to allow a TO to perform its own required risk assessment if the TOs cannot agree on the responsibilities for performing the required risk assessments.

Likes 0	
Dislikes 0	

Response

Thank you for the comments. The DT affirms that each TO can prepare its own risk assessment of the subject station, and that each may have its own methodology. Regarding difficulties in agreement/coordination between TOs, see earlier responses to Duke Energy and Nebraska Public Power District comments. To the extent that agreement can be achieved, this is of course desirable. In the event that it cannot, each Transmission Owner must be able to technically justify its results using its own evidence. In the extremely unlikely scenario that coordination is attempted but fails to occur, evidence of the attempt at coordination will suffice as evidence of coordination.

Chantal Mazza - Chantal Mazza On Behalf of: Junji Yamaguchi, Hydro-Quebec (HQ), 1, 5; Nicolas Turcotte, Hydro-Quebec (HQ), 1, 5; - Chantal Mazza

Answer	No

Is the 36-month periodicity with regard to the coordination, the risk assessment, or both? We suggest adding that only changes in responsibilities of Joint substation or stations should be documented once every 36 months or attestation that no changes occurred in responsibilities during the 36-month period. At scale, these substation and stations can be an administrative burden due to the number of agreements an entity may have, and an overarching document may be a better solution for management of these agreements. We are unsure of the intended goal or end value of the requirement and would like clarification

Does the outcome of the risk assessment need to be agreed to by both parties of a Joint substation or station? Additional clarification on what is expected for the outcome of the coordinated risk assessment should be clarified.

Likes 0	
Dislikes 0	

Response

Thank you for the comments. Coordination must take place such that a risk assessment is completed at least once every 36 calendar months. Regarding coordination and agreement, see previous responses to Duke Energy and Nebraska Public Power District comments.

Stephen Stafford - Stephen Stafford On Behalf of: Greg Davis, Georgia Transmission Corporation, 1; - Stephen Stafford

Answer	No
Document Name	

Comment

The requirement is appropriate in the context that the referenced risk assessment is from a physical security perspective and not a transmission planning analysis perspective. Should the intent of this comment be applicable to physical security and not a transmission planning analysis, then our answer would be yes.

Likes 0	
Dislikes 0	

Response

Thank you for the comments. The SAR supports coordination between multiple Transmission Owners of a station or substation, and specifically in the performance of transmission planning analyses. While CIP-014 is officially a physical security standard, of a practical nature it is a planning standard, as evidenced by the fact that the Time Horizon stated for all Requirements is Near-Term Planning.

Comment	
It is recommended to add R2 (in addition to R1) to the language of R4 so as to clarify that coordination for “Transmission station(s) and Transmission substation(s), irrespective of ownership, within ½ mile of an applicable Transmission station or Transmission substation documented in Requirement R1” may be required - for situations where stations identified under R2 have different ownership.

Response	
Thank you for the comments. The DT was directed in the SAR to “correct any discrepancies between the study period, frequency of study, and the base case(s) a Transmission Owner uses.” The DT clarified and simplified the timeframes, while recognizing the challenges in correcting these discrepancies (24-months-out modeling, 30 and 60 months study frequency) to all entities’ satisfaction.

Transmission Owners who are identified in R1 do not have to be coordinate if they do not have facilities as identified in Attachment 1. The reference to R5 should be deleted and language such as "...their individual and joint responsibilities for performing any required risk assessments per this standard." Has the drafting team considered where two substations are in close proximity together and where a single event can affect both substations: however, one is owned by an applicable entity under R1, and the other is not?	
Likes 0	
Dislikes 0	
Response	
Thank you for the comments. Since R5 is the primary Requirement for risk assessment performance, linking it to R4 is appropriate. Regarding the proximity comment, see responses to comments in the Q2/R2 section.

5. Do you agree with the modifications made in CIP-014-4 with adding Requirement R5 to address the issues identified in the SAR?

Kevin Conway - Western Power Pool - 4

Answer	No
Document Name	

Comment

This goes back to R1 where ALL TOPs should be required to meet R1 (every 36 months), and only those who have Facilities that meet Attachment 1 will be responsible for meeting compliance to the rest of the Standard.

As written, entities may find they are exempt from the proposed standard initially, and there is no requirement for them to re-evaluate their applicability.

It is recommended to also update the R5 VRF to reference the Near-Term Transmission Planning Horizon instead of the Long-Term Transmission Planning Horizon. The R5 VRF Time Horizon still states it applies to 'Long-term Planning Horizon', whereas the NERC Glossary of Terms defines the 'Near-Term Planning Horizon' as the window covering year 1 through 5. This requirement references 'at least once every 36 calendar months', so it is recommended that the R5 VRF Time Horizon language is updated to reference the 'Near-Term Transmission Planning Horizon'. Otherwise, the changes are generally good.

Likes 0	
Dislikes 0	

Response

Thank you for your comments. NERC Glossary of Terms is different from NERC Time Horizons. NERC Time Horizons define "Long-term Planning" as "a planning horizon of one year or longer". This document is located on NERC public site: Document Portrait.

Comment

Was "previously" meant to be struck in R5.1? The intent of this section was believed to be that if a station was previously found to be impactful, it does not have to be restudied; is that not the case?

Requirement R5.3 should be added stating something similar to "Multiple Transmission Owners of stations within proximity as determined in R2 shall share the results of their analyses related to the stations within proximity with all the other Transmission Owners of the stations within proximity."

Likes 0	
Dislikes 0	

Response

Thank you for the comment. The Drafting Team has added "previously" back to section R5.1. Thank you for your suggestion on Requirement R5.3. The drafting team did discuss this and believes the existing standard language does not preclude the TO from sharing their results with proximate substation owners.

Nikki Carson-Marquis - Nikki Carson-Marquis On Behalf of: Theresa Allard, Minnkota Power Cooperative Inc., 1; - Nikki Carson-Marquis

Answer	No
Document Name	
Comment	

MPC strongly disagrees with the use of a 36-month timeframe for utilities who have not previously identified any substations as critical as it is both outside the scope of the SAR and will lead to increased study costs with little or no benefit to BES reliability.

During the 6/7/24 NERC webinar for Draft 1, the SDT stated the goal of changing the risk assessment timeframe to 36 months was to align the CIP-014 risk assessment with the model build timeframe of another standard. Later, MPC requested clarification on which standard the SDT is aligning with during the 10/17/24 industry webinar, and the SDT indicated it aligns with the 12-month timeframe of the TPL-001 standard.

The CIP-014 analysis does not depend on the models built for TPL-001, and MPC believes changing the CIP-014 study timing to align with the TPL-001 model build process provides no additional reliability benefit to the BES for entities that have not identified critical stations/substations. Furthermore, the existing 60-month timeframe can also align with the 12-month model build timeframe of the TPL-001 standard.

Stations and substations planned to be in service within 24 months of the CIP-014 risk assessment are already required to be included under R1 of CIP-014-3 (or within 36 months with proposed CIP-014-4 R1), which suggests that decreasing the risk assessment timeframe from 60 months to 36 months is very unlikely to identify stations or substations that would not already be identified under CIP-014 R1. Moreover, the very slow pace of construction of new electrical infrastructure due to increased equipment lead times, supply chain constraints, and labor shortages makes it highly unlikely that modifications to an existing non-critical Transmission station or substation could be planned, designed, and constructed such that it would be elevated to a critical station/substation within 36 months. It is equally unlikely that a newly constructed CIP-014 critical substation would be completed within this timeframe.

For utilities who have previously not identified substations as critical, reducing the risk assessment timeframe from 60 months to 36 months will result in increased costs due to more frequent risk assessments, with the more frequent assessments having no reliability benefit as they have little to no chance of identifying more Transmission stations or substations as CIP-014 critical that would not already have been under the CIP-014-3 Standard.

Response

Thank you for your comments. The DT did look into this and believes that the current version meets the work scope of the SAR. Requirement R1 is revised to ensure that each Transmission Owner establishes a list of applicable Transmission station(s) or Transmission substation(s) in accordance with Attachment 1. Aligning the 36 calendar months look ahead in Requirement R1 with the 36 calendar month risk assessment cycle ensures that system topology of the cases used to assess applicability is consistent with the system topology in the risk assessment models.

Gary Trezza - Long Island Power Authority - 1 - NPCC

Answer	No

Response

Thank you for the comment. The Drafting Team has added “previously” back to section R5.1. Thank you for your suggestion on Requirement R5.3. The drafting team did discuss this and believe the existing standard language does not preclude the TO from sharing their results with proximate substation owners.

Matt Carden - Southern Company - Southern Company Services, Inc. - 1

Answer	No
Document Name	

Comment

Southern Company agrees with the intent of this requirement. However, as it is presently written, the requirement only applies to jointly owned Transmission station(s) and Transmission substation(s). Consider the below modifications:

R5. At least once every 36 calendar months, each Transmission Owner shall perform a risk assessment to identify Transmission station(s) and Transmission substation(s) that if rendered inoperable or damaged as a result of a physical attack could result in instability, uncontrolled separation, or Cascading within an Interconnection, using the methodology established in Requirement R3 including any Transmission station(s) and Transmission substation(s) identified in accordance with documentation established per Requirements R1, R2, and R4.

Likes 0	
Dislikes 0	

Response

Thank you for your comment. Please see the revised Requirement R5. The drafting team made extensive modifications to clarify that a risk assessment shall be performed at least once every 36 calendar months for all of the Transmission station(s) and Transmission substation(s) identified in Requirements R1, R2 and R4, using the methodology established in Requirement R3, as well as identification of associated primary control centers.

Jessica Cordero - Unisource - Tucson Electric Power Co. - 1

Answer	No
Document Name	

Comment

Does not provide an option for de-classification of a Transmission Substation from critical to non-critical. Additional projects could provide more resiliency to the BES that could result in a substation no longer causing instability, uncontrolled separation, or Cascading within an Interconnection when rendered inoperable or damaged as a result of a physical attack.

Language R5.1 does not provide additional value and is confusing.

How many assessments can be skipped for a specific site identified that causes instability, uncontrolled separation, or Cascading within an Interconnection when rendered inoperable or damaged as a result of a physical attack? The current language implies that a site that is initially identified as causing instability, uncontrolled separation, or Cascading within an Interconnection never needs to be re-evaluated in any future risk assessments.

Likes 0	
Dislikes 0	

Response

Thank you for your comment. Please see revised language. The drafting team made extensive modifications to better lay out the intent of the assessment as well as identification of associated primary control centers.

Comment	
SERC appreciates the ongoing efforts to refine the CIP-014 Risk Assessment portion of the standard. SERC suggests the change from the phrase 'the primary control center' to 'each primary control center' to address real-world situations where different control centers may independently control different Elements within a Transmission station or substation.	
Likes 0	
Dislikes 0	
Response	
Thank you for your comments. The drafting team would like to keep "the primary control center" for associated Elements as in the approved previous version. It is the Transmission Owner's responsibility to identify one primary control center associated with that particular Transmission station or Transmission substation.	
Jamison Cawley - Nebraska Public Power District - 1	
Answer	No
Document Name	
Comment	
We request clarification of the phrase "rendered inoperable or damaged". There seems to be an incongruity between a facility that is simply damaged and one that is rendered inoperable. The phrase "or damaged" indicates a less severe impact than "rendered inoperable", for instance just a portion of the substation may be damaged. We request definitions for "inoperable" and "damaged", as recommended by the NERC 2023 CIP-014 evaluation report, to provide clear intent of the risk assessment. Please explain the technical basis for the change from 60 months (with no previous applicable substations identified) to 36 months for re-performance of the risk assessment. If no technical basis exists, we request the period be returned to the original 60 months. Reducing the period to 36 months will place additional burdens on Transmission Planners, which pulls resources from activities that are also important to grid reliability. Further, most	

significant EHV expansion projects which would alter the previous base case assumptions do not occur every 36 months and are more in line with 60-month construction periods.	
Likes 0	
Dislikes 0	

Response

Thank you for your comments. Regarding the use of "rendered inoperable or damaged", we note that this has existed in all versions of CIP-014; furthermore, we believe it is adequately explained through what is prescribed in the new Requirement R3.

The SAR required the DT to align multiple timelines in CIP-014-3. Requirement R1 is revised to ensure that each Transmission Owner establishes a list of applicable Transmission station(s) or Transmission substation(s) in accordance with Attachment 1. Aligning the 36 calendar months look ahead in Requirement R1 with the 36 calendar month risk assessment cycle ensures that system topology of the cases used to assess applicability is consistent with the system topology in the risk assessment models. The 36 calendar months cycle for updating the list of applicable Transmission station(s) or Transmission substation(s) per Attachment 1 aligns with the annual cycle for performing Planning Assessments per NERC Standard TPL-001. The 36 calendar months risk assessment study cycle aligns with the 36 calendar months planned-to-be-in-service date.

For the Drafting Teams consideration: Clarification is needed regarding stations and substations identified in previous risk assessments as causing instability, uncontrolled separation, or Cascading within an interconnection when rendered inoperable or damaged as a result of a physical attack if those substations will need to be studied is

subsequent risk assessments. In other words, once a station or substation has been identified as ‘critical’ can the TO assume it will continue to be ‘critical’ without having to assess it again?

Likes 0	
Dislikes 0	

Response

Thank you for your support and comments. The answer is yes, once a station or substation has been identified as ‘critical’, the station will continue to be ‘critical’ without having to assess it again. Removing a station from the critical list, the TO has to re-assess it to approve it. Please see the language in Requirement R5, 5.2.

Ben Hammer - Western Area Power Administration - 1

Answer	Yes
Document Name	

Comment

Please provide clarity on the differences between “inoperable” and “damaged” as a result of a physical attack.

Consider adding examples to address various scenarios involving both the substation under study and adjacent substations within the ½ mile proximity.

Likes 0	
Dislikes 0	

Response

Thank you for your support and comments. It is the position of the DT that citing specific examples would be inadvisable primarily due to grid security issues but also due to regional grid variances. As stated previously, we believe that “rendered inoperable or damaged” is adequately explained through what is prescribed in the new Requirement R3.

LG&E/KU supports the modifications in Requirement R5, but suggests two non-substantive clarifications.

First, in the main body of Requirement R5 clarify, "… using the methodology established in Requirement R3 [*including any Transmission station(s) and Transmission substation(s) identified*] **and, where appropriate,** in accordance with **the responsibilities** document[*ation establish*]ed per Requirement R4." As currently written, this sentence implies additional Transmission station(s) and Transmission substation(s) are identified in Requirement R4. However, Requirement R4 only establishes responsibilities for stations with multiple owners. The suggested clarification sharpens the connection between Requirements R4 and R5.

Second, in Requirement R5 Part 5.2 clarify, "… identified **as causing instability, uncontrolled separation, or Cascading within an Interconnection** in the Requirement R5 risk assessment." This Part previously said identified as "critical". Removing the undefined "critical" is a good change, but "identified" does not convey the same meaning on its own.

Likes 0	
Dislikes 0	

Response

Thank you for your support and comments.

After the modification, the current revision says that "At least once every 36 calendar months, each Transmission Owner shall perform a risk assessment to identify applicable Transmission station(s) and Transmission substation(s) identified in Requirement R1, that if rendered inoperable or damaged could result in instability, uncontrolled separation, or Cascading within an Interconnection, using the methodology established in Requirement R3, including any Transmission station(s) and Transmission substation(s) identified in accordance with Requirement R4. If proximate Transmission station(s) and Transmission substation(s) were identified in Requirement R2, they should also be included in the risk assessment." The drafting team believes that this new language provides more clarity.

Please see revised language in Requirement R5, Part 5.3. "as causing instability, uncontrolled separation, or Cascading within an Interconnection when rendered inoperable or damaged" has been added as suggested.

EEI asks the drafting team to consider adding clarity to the technical rationale describing what is intended by Requirement R5, Part 5.1 that states "A Transmission station or Transmission substation identified in dynamic or steady-state simulations as causing instability, uncontrolled separation, or Cascading within an Interconnection when rendered inoperable or damaged as a result of a physical attack does not require any additional simulations during the current risk assessment." It is not clear if the intention is for those stations and substations to be reassessed every 36 calendar months if they've already been identified, or if keeping them on the list for applying CIP-014 protections is sufficient after their initial assessment.

NV Energy appreciates the drafting team reverting to the "identified" language of previous versions for continuity with the remainder of the requirements that remain unchanged. Can the drafting team provide more clarity on what is meant by "if rendered inoperable or damaged as a result of a physical attack"? Rendered inoperable appears to indicate a more severe impact where "or damaged" seems much less severe such as just a portion of a substation system. It is also not clear if rendered inoperable or damaged refers to the substation transmission system or the control and protection systems or both. This is a fundamental source of confusion as to how protection system functions are impacted and how/where faults should be applied for these studies that will be acceptable to auditors. For example, are faults applied simultaneously to different voltage levels, or only at the local substation under attack, or all included elements one at a time? This would seem to depend on the type of attack and what is rendered inoperable or damaged. The	

NERC 2023 CIP-014 evaluation report noted that a criterion should also include defining “inoperable” or “damaged” substations such that the intent of the risk assessment is clear.

It is also unclear if the “physical attack” is on the primary transmission system such as occurring outside the fence remote to the substation or internal on the control house systems inside the substation, or if it is on all systems. An attack could mean there are explosives involved, gunshots remote from the substation, or invasive personnel onsite. Which of these are more likely? There should be more industry agreement on how an attack impacts a substation and the primary system and underlying control and protection systems. The open-ended nature of “physical attack” results in very different interpretations of severity and subsequent protection system fault modeling results. This could be especially true depending on substation locations and inherent risk differences throughout the country. Clarify if the decisions to the questions above are left up to each company and their own assessment methodology?

Add examples to the rationale to address the various scenarios involving a substation under study and any adjacent substations meeting the ½ mile proximity. For example: Are they faulted simultaneously or individually with or without the same damage or inoperability? Are these questions up to each individual assessment methodology?

NextEra supports the comments provided by EEI below: EEI asks the drafting team to consider adding clarity to the technical rationale describing what is intended by Requirement R5, Part 5.1 that states “A Transmission station or Transmission substation identified in dynamic or steady-state simulations as causing instability, uncontrolled separation, or Cascading within an Interconnection when rendered inoperable or damaged as a result of a physical attack does not require any additional simulations during the current risk assessment.” It is not clear if the intention is for those stations and substations to be reassessed every 36 calendar months if they’ve already been identified, or if keeping them on the list for applying CIP-014 protections is sufficient after their initial assessment.

6. Do you agree with the Implementation Plan for CIP-014-4?

Bob Cardle - Bob Cardle On Behalf of: Marco Rios, Pacific Gas and Electric Company, 3, 1, 5; Sandra Ellis, Pacific Gas and Electric Company, 3, 1, 5; Tyler Brun, Pacific Gas and Electric Company, 3, 1, 5; - Bob Cardle

Answer	No
Document Name	

Comment

The CIP-014-4 standard introduces a significant change by requiring the inclusion of stations within a 1/2-mile line of sight or easily accessible from a common roadway. However, the standard lacks clear guidelines for selecting stations. This could lead to inconsistencies and challenges in implementation, as different Transmission Owners and Transmission Operators may interpret and apply the criteria differently.

To improve clarity and ensure consistent implementation, the standard should provide more detailed guidance on the selection of stations, including specific criteria for evaluating lines of sight and ease of access from common roadways. This would help Transmission Owners and Transmission Operators to better understand the requirements and apply them consistently, ensuring the reliability and security of the electrical grid.

Response

Thank you for your comment. Please see the revised Standard for your concern. In addition, the initial performance of periodic Requirements is clarified in the Implementation Plan.

Alison Nickells - NiSource - Northern Indiana Public Service Co. - 1

Answer	No
Document Name	

Comment

NIPSCO agrees with Southern CO:

It potentially could be excessively burdensome on a Transmission Owner (TO) to be required to perform a new risk assessment study within 24 months of the effective implementation date of the revised CIP-014-4 standard. Additionally, limited resources may be available to complete a verification within 90 days of the effective date per Requirement R6.

For example, given the current CIP-014-3 R1.1 30 calendar month subsequent risk assessment requirement schedule for a TO which has substations identified under R1, the TO may currently be required to complete a subsequent R1 study as of September 30, 2025.

If the revised standard has an effective implementation date of October 1, 2025, the TO would be required to complete a new R1 study within 24 months of October 1, 2025. A more effective and efficient

methodology is a phased approach based on the TO's completion date of the TO's most recent R1.1 subsequent risk assessment study.

Proposed Language: Each TO shall conduct its first assessment under CIP-014-4 within 36 calendar months after the effective date or within 36 calendar months after their last assessment under CIP-014-3, whichever occurs later.

For entities with facilities spread over many states that were constructed at significantly different times, the additional work included in this version will make it more complicated to complete by the effective date. Additional constraints with completing the required work will occur depending on the timing of their compliance with the existing version. An additional 6 months, or 30 months, would make this more feasible.

Recommending making CIP-014-4 effective 12 months after applicable government authority approval. The first assessment under CIP-014-4 shall be completed at the earlier of the following:	

- Within 30 calendar months of its previous risk assessment under CIP-014-3 if it identified one or more transmission stations or transmission substations that if rendered inoperable or damaged could result in instability, uncontrolled separation, or cascading within its interconnection in its last CIP-014-3 risk assessment;
- Within 60 calendar months of its previous risk assessment under CIP-014-3 if it did not identify any transmission stations or transmission substations that if rendered inoperable or damaged could result in instability, uncontrolled separation, or cascading within its interconnection in its last CIP-014-3 risk assessment;
- Within 24 months of the effective date of CIP-014-4.

Response

Thank you for your comment. The initial performance of periodic Requirements is clarified in the Implementation Plan. Based on the industry comments a majority of entities expressed that they need more than 12 months to be ready to comply with CIP-014-4 after applicable government authority approval.

Amy Wesselkamper - PNM Resources - Public Service Company of New Mexico - 3

Answer	No
Document Name	

Comment

PNM and TNMP suggest phased implementation. For example >=24 months to comply with R1-R4 on or before effective date and “initial R5 risk assessment” some period, e.g. 12 calendar months, after effective date.

Response

Thank you for your comment. The initial performance of periodic Requirements is clarified in the Implementation Plan. The drafting team believes that 24 calendar months is adequate for the industry to prepare for the new revision of the Standard. Since the current version of CIP-014-3 is on a 30-month cycle, there are a few extra months added for process before Board of Trustee and FERC for adoption/approval once the Standard gets approved by the industry.

Mark Garza - FirstEnergy - FirstEnergy Corporation - 4, Group Name FE Voter

Answer	No
Document Name	

Comment

FirstEnergy sees the current version requiring a 2-year cycle. With the implementation of CIP-014-4, has Drafting Team considered a 5-year gap that could result in the implementation of the newest version?

FirstEnergy also supports EEI Comments which state:

EEI is concerned that the implementation plan requires the initial risk assessment required by CIP-014-4 to be completed on or before the effective date of the Standard and does not provide a phased in approach. The modifications required by the proposed CIP-014-4 include new processes to be established prior to initiating new risk assessments. The proposed 24-month timeline is not reasonable for completing the initial risk assessment. EEI suggests allowing the initiation of CIP-014-4 risk assessments to occur on or before the effective date of the standard to allow additional time to modify programs.

Response

Thank you for your comment. The initial performance of periodic Requirements is clarified in the Implementation Plan. Based on the current Implementation Plan drafted, the greatest time gap would be 30 calendar months.

Leshel Hutchings - AEP - 3

Answer	No
Document Name	

Comment

The proposed implementation plan is 24 months. This means some Transmission Owners may have insufficient time, less than 36 months, to complete their next assessment based on the new standard. Example: a TO with an existing compliance deadline at the end of this year may fall under the shortened timeline. For large TOs, the existing applicability scoring, case prep, steady state and stability analysis, and third-party review can take as long as 1 year to perform per region. AEP has three regions (PJM, SPP, and ERCOT), which each take this amount of time. With the proposed proximity/applicability changes, scenario changes, and this implementation period would be insufficient time to adopt and reperform the assessment. In

addition, given the new proximity criteria some small TOs may not have had any applicable stations previously and will have to create a new methodology and perform the assessment from scratch within that short 24-month period.

Comment

MPC disagrees with the requirement to perform an analysis under CIP-014-4 prior to the effective date of the standard. This will very likely require utilities to perform a largely duplicative analysis in less than 30 months from their previous analysis. Such a duplicative analysis increases the study burden on utilities for no foreseeable benefit to BES reliability.

Ronald Hoover - Bonneville Power Administration - 1,3,5,6 - WECC

Answer	No
Document Name	

Comment

BPA appreciates the addition of the clarifying language about the first R5 due date. However, BPA identifies a potential overlap or gap when considering the current review cycle for the standard against a 24-month implementation plan. It is possible that an entity would have to adopt the new language extremely early to align with its next Version 3 cycle or perform an extra round of CIP-014 activities during the period in between Version 3 activities. BPA recommends using terminology such as that found in other standards such as FAC-014-3 R6:

"Requirement R6 shall be implemented by the Planning Coordinator or Transmission Planner following the effective date of FAC-014-3 when it begins its next cycle for conducting the studies to support its Planning Assessment."

BPA believes the inclusion of this language would help to reduce overall costs for the implementation of the changes.

Thank you for your comment. The initial risk assessment required by Reliability Standard CIP-014-4 Requirement R5, must be completed on or before the effective date of the standard. Subsequent risk assessments shall be performed no later than 36 calendar months following the effective date of Reliability Standard CIP-014-4 The implementation plan would then allow 24 calendar months after the effective date of the Applicable Governmental Authority's order approving the standard or as otherwise provided for by the Applicable Governmental Authority.

Comment	
Texas RE recommends the implementation plan specify the list shall be established by the effective date of the standard to avoid delaying compliance obligations an additional 36 months. Absent a specified initial performance date in the implementation plan, the Transmission Owner would have until 36 months after the effective to establish its first list of Transmission station(s) and Transmission substation(s).

Thank you for your comments and recommendations. Please see revised Implementation Plan.	

7. Do you agree that CIP-014-4 is cost effective to address the reliability issue of physical security? If no, why not?

Ronald Hoover - Bonneville Power Administration - 1,3,5,6 - WECC

Answer	No
Document Name	

Comment

BPA does not believe the standard, as is, is cost effective in addressing the reliability of physical security. The spectrum of sites is too broad. BPA believes there is high potential for sites to be identified on CIP-014-4 list that would have little to no effect on the BES if they were disconnected from the grid. The standard, as is, allows sites with RAS capability to be listed as CIP-014, which mitigates an enormous amount of risk, some might argue all. The number of sites that could potentially be categorized as CIP-14 takes resources away from other sites along critical pathways, and sites that directly link to critical infrastructure. Additionally, day-to-day operations of upstream and downstream sites affect whether singular or multiple pieces of equipment in a site are critical. BPA finds the inclusions of R2.1 and R2.2 are so broad as to compound the issues of cost without a large gain in security or reliability. BPA believes the increase in CIP-014 applicability may require more resources than some smaller Transmission Owners have at their disposal. This increase will not only strain the resources of those smaller Transmission Owners but those of larger size within a BA that may be called upon to assist.

Comment

Requiring the CIP-014 risk assessment every 36 months for utilities who have not previously identified any stations or substations as critical is not cost effective; see MPC's comments in response to Question 5.

Likes 0	
Dislikes 0	

Response

Thank you for the comment. If you do not have any stations meeting Attachment 1 criteria, you do not need an assessment. If your system has not changed, the chances are you will remain the same. The drafting team balanced concerns regarding the burden on applicable Transmission Owners and the benefits to reliability from identifying and physically protecting those Transmission stations, Transmission substations, and their associated primary control centers that are critical to the reliable and secure operation of the BPS.

Leshel Hutchings - AEP - 3

Answer	No

Document Name	

Comment

While this SAR focused on the R1 risk assessment, the most effective protection against all possible threat vectors is to plan redundancy into the Transmission system to remove single points of failure. Protecting individual stations against specific threats will always be less effective than Transmission build out. The standard should be revised to consider Transmission Planning mitigations rather than defaulting to adding physical security.

Thank you for the comment. The drafting team appreciates your feedback.

Rebika Yitna - Rebika Yitna On Behalf of: Roger Brand, MEAG Power, 3, 1; - Rebika Yitna

Answer	No
Document Name	

Comment

Performing the risk assessment every 36 months rather than every 60 months for those entities with no applicable stations/substations in the previous risk assessment does increase cost for TOs internally and increases the cost of using an unaffiliated 3rd party to verify the risk assessment. Also, it is expected with the newly added 'proximity within 1/2 mile', stations/substations in R2 will incur additional cost burden and not be cost effective, especially if the station/substation in 'proximity within 1/2 mile' is also found to be applicable and requires physical security enhancements to address any potential threats and/or vulnerabilities.

Response

Thank you for the comment. The drafting team balanced concerns regarding the burden on applicable Transmission Owners and the benefits to reliability from identifying and physically protecting those Transmission stations, Transmission substations, and their associated primary control centers that are critical to the reliable and secure operation of the BPS. The DT also reduced the ½ mile to 1500 feet.

Matt Carden - Southern Company - Southern Company Services, Inc. - 1

Answer	No
Document Name	

Comment

Southern Company recognizes the financial impacts of performing the risk assessment every 36 months rather than 60 months for Transmission Owners that have not identified any Transmission stations or Transmission substations. This is magnified by the requirement to have an unaffiliated third party verify the risk assessment at a higher frequency.

Response
Thank you for the comment. The drafting team balanced concerns regarding the burden on applicable Transmission Owners and the benefits to reliability from identifying and physically protecting those Transmission stations, Transmission substations, and their associated primary control centers that are critical to the reliable and secure operation of the BPS. In the previous version of CIP-014, the 30-month time frame and the 24-month planned-to-be-in-service date could, if not carefully applied, lead to gaps between models and study horizons. Aligning the 36 calendar months look ahead in Requirement R1 with the 36 calendar month risk assessment cycle ensures that system topology of the cases used to assess applicability is consistent with the system topology in the risk assessment models. It is necessary to perform the risk assessment every 36 months and closing the gap for reliability is the priority.

Amy Wesselkamper - PNM Resources - Public Service Company of New Mexico - 3	
Answer	No
Document Name	
Comment	
Increasing the frequency of risk assessments, including the R6 requirement for third-party validation causes increase demand on resources. The cost seems disproportionate to the potential benefit.

Answer	No
Document Name	
Comment	
The issues of requiring Transmission Owners perform a Transmission Planning/Planning Coordinator function is problematic and makes assessment of cost-effectiveness unclear. Additionally, this dynamic will continue to lead to lack of clarity and consistency in the auditing of this standard which could result in cost and workload to address/respond to the requirements and audit reviews. Additionally, the requirement to add stations that are within a ½ mile radius of applicable stations will add more cost without any justification for the requirement. Furthermore, requiring a third-party verification of a planning assessment appears to be an unnecessary expense. Is there supporting evidence from the 2015 – 2024 time-period to show the benefits of this verification?

Thank you for the comment. The drafting team is aware that increasing the Requirements seems to increase the work, in order to meet the SAR work scope.The drafting team balanced concerns regarding the burden on applicable Transmission Owners and the benefits to reliability from identifying and physically protecting those Transmission stations, Transmission substations, and their associated primary control centers that are critical to the reliable and secure operation of the BPS.	
Lucinda Bradshaw - Lucinda Bradshaw On Behalf of: Byron Booker, Oncor Electric Delivery, 1; - Lucinda Bradshaw	
Answer	No
Document Name	
Comment	
The comments above demonstrate that additional clarity is needed on certain portions of this revised CIP-014-4. Without that additional clarity, Oncor cannot state that the proposed changes to CIP-014-3 are cost effective. As noted above, some of these proposed revisions create additional burdens on TOs that could increase costs to TOs. For example, the additional burdens on TOs created in R2 and R4 will require new procedures and processes to be developed, documented, approved, and implemented – including the development and implementation of additional training concerning the new requirements.

Comment

The cost-effectiveness of CIP-014-4 in addressing physical security and reliability concerns is not entirely clear. The changes introduced, particularly regarding proximity criteria, may lead to a broader range of substations being classified for criticality assessment. This expansion could result in increased costs for compliance and implementation.

Gail Elliott - Gail Elliott On Behalf of: Michael Moltane, International Transmission Company Holdings Corporation, 1; - Gail Elliott	
Answer	No
Document Name	
Comment	
There are two requirements that increase the cost to complete this study that do not improve reliability significantly. The first is R4. Collecting existing documentation on compliance responsibilities will only improve reliability if neither entity is performing a CIP-014 on specific sites. In NERC's, report this was not identified as a reliability gap. The second is for R2 where entities need to one share their existing and planned future applicable sites with other entities in order to receive data on whether or not they have or plan to build a transmission site nearby. Based on the footprints and configurations of a Transmission Owners facilities, this could involve disclosing to a number of entities information that is deemed sensitive if not CEII.	
Likes 0	
Dislikes 0	
Response	
Thank you for the comment. Please see revised Standard. Requirement R2 provides applicable entities clarification on which station(s) and substation(s) are applicable. Because the CIP-014-4 Risk Assessment Refinement SAR calls for clarification regarding Transmission substations and Transmission stations of differing ownership, this section was clarified in Requirement R4. Requirement R4 is to close the reliability gaps on different ownership of the stations. This issue was missing from the standard language. The drafting team balanced concerns regarding the burden on applicable Transmission Owners and the benefits to reliability from identifying and physically protecting those Transmission stations, Transmission substations, and their associated primary control centers that are critical to the reliable and secure operation of the BPS.

The SAR states: "The cost impacts for the proposed changes to CIP-014-3 are expected to be minimal. The changes add clarity to the current Standard to bring consistency and clarify expectations for effectively evaluating for instability, uncontrolled separation, and Cascading following a physical attack. The upper limit of cost added to entities is bounded due to no alteration of applicable substations potentially receiving security control upgrades. Rather, the cost incurred will be on the additions of study rigor, which again are anticipated to be relatively minimal." The Drafting team has not provided additional data, and the dynamic and steady-state requirements are outside of the TO's area of responsibility. This requires a TO to access this expertise through contracting or other methods. The Drafting Team has failed to identify how this Standard may further capture additional Facilities, and require entities to take further security mitigations. The Implementation Plan will require entities to reevaluate all of the risk assessment processes sooner that the current 36-month review period, since they will have to be compliant with all Facilities with 24 months of the proposed standard. This proposed standard fails to conduct a cost impact study, and we believe there are significant hidden costs in implementing this proposed standard.

The second draft of CIP-014-4 sufficiently addresses many of the issues described in the SAR and provides an appropriate level of detail in the risk assessment requirements. Broadly, the second draft of CIP-014-4 is an improvement on CIP-014-3 and will improve consistency in risk assessment methodology throughout the industry. The cost effectiveness of CIP-014-4 for addressing physical security is difficult to determine, but the improvements over CIP-014-3 are appreciated.

Overall, ATC can stand behind most of the changes but would like to see updates on Requirement R2 before moving forward. Additionally, please clarify in this standard if TOs and TOPs still need to do a study or assessment on previously qualified facilities if our company's corporate security team has voluntarily determined they were going to implement the highest level of physical security they have for a new or existing site. Does the SDT intend for TOs and TOPs to have to study those sites if they were already going to be classified at that high level of security. If not, this would be a really good exception to note that would save many companies a lot of time and effort.

The CIP-014-4 standard introduces a significant change by requiring the inclusion of stations within a 1/2-mile line of sight or easily accessible from a common roadway. However, the standard lacks clear guidelines for selecting stations. This could lead to inconsistencies and challenges in implementation, as different Transmission Owners and Transmission Operators may interpret and apply the criteria differently. To improve clarity and ensure consistent implementation, the standard should provide more detailed guidance on the selection of stations, including specific criteria for evaluating lines of sight and ease of access from common roadways. This would help Transmission Owners and Transmission Operators to better understand the requirements and apply them consistently, ensuring the reliability and security of the electrical grid.

Comment
ITC is concerned that the proposed CIP-014-4, Attachment 1, Criterion 3 does not align with revisions to FAC-014-3 that became effective on April 1, 2024, which places the responsibility for establishing Interconnection Reliability Operating Limits (IROLs) for its Reliability Coordinator Area with the Reliability Coordinator in accordance with its system operating Limit methodology (SOL methodology). We suggest the revision below: 3.Facilities at a single station or substation location that are identified by its Reliability Coordinator as critical to the derivation of Interconnection Reliability Operating Limits (IROLs) and their associated contingencies.

Can the standard also provide a process diagram showing activities (at least for the Risk Assessment portion) alongside a time scale which would help to show the overlap of frequency of report (start to start) overlapping with how far the study should look out for facilities to be in-service. This has been a source of confusion in the industry and although was not required in the SAR, will help to clarify many misunderstandings.

Response	
Thank you for your comment. The DT believes that criteria in the Attachment 1 is sufficiently clear, and specifically for part 2 of Attachment 1 that all lines should be counted unless terminating at a collecting bus.	
Dave Krueger - SERC Reliability Corporation - 10	

Answer	
Document Name	
Comment	

SERC appreciates the ongoing efforts to refine the CIP-014 Risk Assessment portion of the standard. With the revisions to R1-R3, it is unclear how SAR Scope item #2 “Clarify the case(s) used for the risk assessment to be tailored to the Requirement R1 in-service window and correct any discrepancies between the study period, frequency of study, and the base case(s) a Transmission Owner uses.” Is being addressed, in order to insure high accuracy and fidelity to actual planned system conditions within the 36 month time period are addressed.

Likes 0	
Dislikes 0	
Response	

Thank you for your comment. In accordance with Requirement R1, each Transmission Owner shall at least once every 36 calendar months document existing or planned to be in service within 36 calendar months Transmission stations and Transmission substations. In accordance with Requirement R5, each Transmission Owner shall perform a risk assessment at least once every 36 calendar months. Requirement R3 Part 3.2 has been revised to provide additional clarity related to the base cases.

Comment

To reiterate my comment from R3... we have experienced disagreement with regulators about what type of physical attack we are supposed to be simulating. The regulators we spoke with expected a severe "smoking crater" scenario, but our physical security personnel suggested looking at what the most likely scenarios would be (i.e. things seen in previous incidents). The standard provides no guidance here and leaves the choice of scenarios up to us. The type of attack to expect is not something that seems like it would vary by utility, so it makes sense that the standard would specify this rather than leaving it up to individual entities to determine. Some guidance in the standard would help clear up the ambiguity so that we can choose appropriate contingencies to run and avoid friction with regulators.

AZPS appreciates the clarifications included by the DT in this draft, however continues to seek additional clarifications regarding entity responsibilities or exclusion of responsibilities for non-owned/operated stations/substations within proximity of identified locations. For example, the relationship and requirements between Transmission Owners and Transmission Operators when adjacent facilities are involved is not clear. The Transmission Owner and Transmission Operator can be different entities and R8 states the notification is made to the adjacent Transmission Operator. The Transmission Owner performing the assessment and identifying the facilities in R5 will be subject to doing the Physical assessments and protection, however it is not clear how the Transmission Owner of the adjacent facility is notified and what, if any, requirements they have.

The primary issue with this standard as it is written, and as this draft continues is the application of requirements/expectations appropriate for the Transmission Planner/Planning Coordinator function to the Transmission Owner instead. This reduces clarity on the types of studies to be performed to assess the extreme events identified in this standard.

Regarding R6:

With an attempt at clarifying study criteria, though they should be applied to the appropriate planning entity, there is no reason to maintain a requirement for an unaffiliated third party to perform a verification of a transmission planning analysis associated with the risk assessment. Instead of requiring planning entities be the third-party verifier, they should just perform the study under clearly defined requirements in a TPL standard and communicate this information to the Transmission Owner. It is also important to note the third party verifying the risk assessment for this physical security standard is not required to have expertise in that area according to this requirement. Additionally, the SDT should consider removing the Reliability Coordinator as a potential third-party verifier as that function does not perform the type of analysis being sought in this standard.

Additional Comment:

The analysis outlined in the CIP-014 standard is an evaluation of an extreme event and is based on transmission planning analysis. Currently, the existing TPL-001 standard requires the evaluation of extreme events, though, it is not specific to this particular substation outage analysis and corrective actions are not required for these events. Additionally, there are ongoing efforts to establish a separate standard to address the long-term planning analysis around extreme weather events. It would seem NERC and the industry are potentially missing an opportunity to consolidate requirements around the evaluation of extreme events better than what is currently provided for in the current construct of the existing and planned Reliability Standards. Consideration should be given by NERC to provide a better pathway to house long-term planning requirements around extreme event analysis within the TPL standards (not CIP) and specify the reliability analyses needed, the parameters for determining reliability, expectations for corrective actions, and the communication path from planning to owners and others with a reliability-related need for this information. The planning assessment/CAP required by TPL-001 is already required to be distributed to applicable owners. Clarifying the extreme event expectations in TPL-001 to specify the substation outage alluded to in CIP-014 is one pathway to better align standard requirements with the appropriate entity.

Comment

Southern Company recommends swapping Requirement R3 and R4 chronologically. This follows a more logical approach of identifying the stations and responsibilities to perform the assessment in the first three requirements followed by an assessment methodology in R4 and the performance of an assessment in R5.

Southern Company recommends removing Requirement R6. With the understanding that this is not explicitly in scope of the current SAR, the added specificity of the proposed standard eliminates the reliability benefit of the third-party verifier. Additionally, based on a previous audit of CIP-014-3, Southern Company did not observe the Regional Entity take into consideration the review by the R2 third party verifier. If this is consistent across other Regional Entities, then an elimination of CIP-014-4 R6 may be appropriate due to the extra cost and the lack of a reliability benefit.

WAPA recommends the SDT remove the third party verification Requirement R6. WAPA is concerned that this requirement holds an entity responsible for the actions of another organization, and creates the risk of non-compliances when a separate reviewer fails to complete their work on time.

While this elimination is not explicitly mentioned in the SAR, it is directly tied to the changes proposed in the SAR. The purpose of the third party verification goes away with the increased prescriptiveness of the risk assessment being made in the drafts of CIP-014-4. In addition, since the SAR indicates that industry was not implementing a consistent approach to the risk assessments, then that indicates the third party verifications were also proving to be of little value. This independent verification is a burdensome and costly endeavor that has not proven to be value-added. Planning this task with eligible vendors requires significant work to coordinate and thousands of dollars to complete. Given that the verifications exist solely to offer feedback on an approach which will no longer be required with the increased specificity in R3, then their removal would eliminate what has become an unnecessary administrative burden.

The Drafting Team's survey should be rethought going forward. Simple asking for a response that a requirement meets the SAR is lazy and requires the respondent to search the SAR for where the individual requirement may fit. The Drafting Team is encouraged to identify and map where a requirement is addressing each issue in the SAR. This will allow the respondent to provide much more specific feedback. As in other standards that have specific applicability, all TOs should have to meet the R1 requirement every 36 months. They would then be able to determine their applicability to the other requirements if they meet the threshold. TO's do not have transmission planning resources, and requirements that require the entity to do transmission studies, should be assigned to Transmission Planners or Planning Coordinators. If this is not done, the results of the effects of losing one or more transmission Facilities will be inconsistent and potentially could conflict with TPL-001 results.

Response	

Thank you for your comment. References to applicable item(s) in the SAR has been added to each ‘Rationale for Requirement’ in the Technical Rationale document. The Standard Authorization Request (SAR), which defines the scope of work for the Project 2023-06 Drafting Team (DT) only lists Transmission Owners and Transmission Operators as Functional Entities to which the proposed standard should apply.

Standard Development Timeline

This section is maintained by the drafting team during the development of the standard and will be removed when the standard is adopted by the NERC Board of Trustees (Board).

Description of Current Draft

CIP-014-4 is posted for a 45-day formal comment period with additional ballot.

Completed Actions	Date
Standards Committee approved Standard Authorization Request (SAR) for posting	June 21, 2023
SAR posted for comment	July 26, 2023 – August 24, 2023
Accepted Revised SAR	January 17, 2024
45-day formal or informal comment period with ballot	May 20, 2024 – July 3, 2024
45-day formal or informal comment period with additional ballot	September 23, 2024 – November 6, 2024

Anticipated Actions	Date
45-day formal comment period with additional ballot	June 6, 2025 – July 21, 2025
10-day final ballot	August 11, 2025 – August 20, 2025
Board adoption	February 11, 2026

New or Modified Term(s) Used in NERC Reliability Standards

This section includes all new or modified terms used in the proposed standard that will be included in the *Glossary of Terms Used in NERC Reliability Standards* upon applicable regulatory approval. Terms used in the proposed standard that are already defined and are not being modified can be found in the *Glossary of Terms Used in NERC Reliability Standards*. The new or revised terms listed below will be presented for approval along with the proposed standard. Upon Board adoption, this section will be removed.

Term(s):

None.

A. Introduction

1. **Title:** Physical Security

2. **Number:** CIP-014-4

3. **Purpose:** To identify and protect Transmission stations and Transmission substations, and their associated primary control centers, that if rendered inoperable or damaged due to a physical attack, could cause instability, uncontrolled separation, or Cascading within an Interconnection.

4. **Applicability:**

   4.1. Functional Entities:

   4.1.1. Transmission Owner that owns or jointly owns one or more Transmission stations or Transmission substations that meet the applicability criteria of Attachment 1.

   4.1.2. Transmission Operator

   Exemption: Facilities in a "protected area," as defined in 10 C.F.R. § 73.2, within the scope of a security plan approved or accepted by the Nuclear Regulatory Commission (NRC) are not subject to this Standard; or Facilities within the scope of a security plan approved or accepted by the Canadian Nuclear Safety Commission are not subject to this Reliability Standard.

5. **Effective Date:** See Implementation Plan for CIP-014-4.

B. Requirements and Measures

R1. Each Transmission Owner, at least once every 36 calendar months, shall identify each applicable Transmission station and Transmission substation meeting any of the criteria in Attachment 1 that is either existing or planned to be in service within 36 calendar months. *[Violation Risk Factor: High; Time-Horizon: Long-term Planning]*

M1. Examples of evidence may include, but are not limited to, dated written or electronic documentation of the Transmission station(s) and Transmission substation(s) (existing and those planned to be in service within 36 calendar months) that meet any of the criteria in Attachment 1.

R2. Each Transmission Owner shall identify proximate Transmission station(s) and Transmission substation(s), irrespective of ownership, within 1500 feet or 457 meters (the shortest distance, measured substation fence line to substation fence line) of an applicable Transmission station or Transmission substation identified in Requirement R1. *[Violation Risk Factor: Medium; Time-Horizon: Long-term Planning]*

M2. Examples of evidence may include, but are not limited to, dated written or electronic documentation of the Transmission stations or Transmission substations determined in Requirement R2.

R3. Each Transmission Owner shall have a documented risk assessment methodology for evaluating the loss of each applicable Transmission station or Transmission substation identified in Requirement R1. The methodology shall include, at a minimum, the following: *[Violation Risk Factor: High; Time-Horizon: Long-term Planning]*

3.1. Documented criteria for assessing instability, uncontrolled separation, or Cascading within an Interconnection. The criteria shall include, at a minimum, thresholds identifying unacceptable generation and load loss within an Interconnection.

3.2. A provision that steady-state and dynamic simulations shall each be performed using a System peak Load case and a System Off-Peak Load case.

3.3. A specification for Fault simulations, including:

- For each applicable Transmission station or Transmission substation listed in accordance with Requirement R1, a Fault at the applicable Transmission station or Transmission substation.
- For each Transmission station or Transmission substation determined in accordance with Requirement R2 as being in proximity to an applicable Transmission station or Transmission substation, Faults at both the applicable and proximate Transmission station(s) or Transmission substation(s).

3.4. A specification that Fault simulations assume the loss of communication and Protection Systems at the applicable Transmission station(s) or Transmission

substation(s) prior to or simultaneous with the Fault(s) studied under Requirement R3, Parts 3.3.1 and 3.3.2.

- Removal of all Elements that Protection Systems and other controls are expected to automatically disconnect for each event.
- Delayed (remote) clearing times shall be used unless otherwise technically substantiated.
- Actual or more conservative clearing times shall be used unless otherwise technically substantiated.

M3. Each Transmission Owner shall provide dated evidence, such as electronic or hard copies, of a risk assessment methodology satisfying Requirement R3.

R4. Each Transmission Owner with applicable Transmission station(s) and Transmission substation(s) identified in Requirement R1 containing Bulk Electric System (BES) Elements owned by multiple Transmission Owners shall coordinate with each appropriate Transmission Owner(s) to determine and document their individual and joint responsibilities for documenting a risk assessment methodology under Requirement R3 and for performing any required risk assessments per Requirement R5. *[Violation Risk Factor: Medium; Time-Horizon: Operations Planning, Long-term Planning]*

M4. Examples of acceptable evidence may include, but are not limited to, dated documentation, such as meeting minutes, agreements, and email correspondence, that identifies that agreement has been reached on individual and joint responsibilities for performing the required risk assessments.

R5. At least once every 36 calendar months, each Transmission Owner shall perform a risk assessment to identify applicable Transmission station(s) and Transmission substation(s) identified in Requirement R1, that if rendered inoperable or damaged could result in instability, uncontrolled separation, or Cascading within an Interconnection, using the methodology established in Requirement R3, including any Transmission station(s) and Transmission substation(s) identified in accordance with Requirement R4. If proximate Transmission station(s) and Transmission substation(s) were identified in Requirement R2, they should also be included in the risk assessment. *[Violation Risk Factor: High; Time-Horizon: Operations Planning, Long-term Planning]*

5.1. During the current risk assessment, a Transmission station or Transmission substation identified in either the dynamic or steady-state simulation as causing instability, uncontrolled separation, or Cascading within an Interconnection when rendered inoperable or damaged requires no further simulation.

5.2. If a previous risk assessment has identified a Transmission station or Transmission substation as causing instability, uncontrolled separation, or

Cascading within an Interconnection when rendered inoperable or damaged, then the Transmission Owner may forgo additional assessments on that Transmission station or Transmission substation. Requirement R5, Part 5.3 and Requirement R7 through Requirement R10 still apply to that Transmission station or Transmission substation until a new risk assessment demonstrates otherwise.

5.3. The Transmission Owner shall identify the primary control center that operationally controls each Transmission station or Transmission substation identified as causing instability, uncontrolled separation, or Cascading within an Interconnection when rendered inoperable or damaged in the Requirement R5 risk assessment.

M5. Examples of acceptable evidence may include, but are not limited to, dated written or electronic documentation of the risk assessment satisfying Requirement R5 including the identified Transmission station(s) or Transmission substation(s). For Requirement R5, Part 5.3, examples of acceptable evidence may include, but are not limited to, dated written or electronic documentation of the identification of the primary control center that operationally controls each identified Transmission station or Transmission substation.

R6. Each Transmission Owner shall have an unaffiliated third party verify the risk assessment performed under Requirement R5. The verification may occur concurrently with or after the risk assessment performed under Requirement R5. *[Violation Risk Factor: Medium; Time-Horizon: Long-term Planning]*

6.1. Each Transmission Owner shall select an unaffiliated verifying entity that is either:

- A registered Planning Coordinator, Transmission Planner, or Reliability Coordinator; or
- An entity that has transmission planning or analysis experience.

6.2. The unaffiliated third-party verification shall verify the Transmission Owner's risk assessment performed under Requirement R5, which may include recommendations for the addition or deletion of a Transmission station(s) or Transmission substation(s). The Transmission Owner shall ensure the verification is completed within 90 calendar days following the completion of the Requirement R5 risk assessment.

6.3. If the unaffiliated verifying entity recommends that the Transmission Owner add a Transmission station(s) or Transmission substation(s) to, or remove a Transmission station or Transmission substation from, its identification under Requirement R5, the Transmission Owner shall either, within 60 calendar days of completion of the verification, for each recommended addition or removal of a Transmission station or Transmission substation:

- Modify its identification under Requirement R5 consistent with the recommendation; or
- Document the technical basis for not modifying the identification in accordance with the recommendation.

6.4. Each Transmission Owner shall implement procedures, such as the use of non-disclosure agreements, for protecting sensitive or confidential information made available to the unaffiliated third-party verifier and to protect or exempt sensitive or confidential information developed pursuant to this Reliability Standard from public disclosure.

M6. Examples of acceptable evidence may include, but are not limited to, dated written or electronic documentation that the Transmission Owner completed an unaffiliated third party verification of the Requirement R5 risk assessment and satisfied all of the applicable provisions of Requirement R6, including, if applicable, documenting the technical basis for not modifying the identification in Requirements R1, R2, R3, R4, and R5 as specified under Part 6.3. Additionally, examples of evidence may include, but are not limited to, written or electronic documentation of procedures to protect information under Part 6.4.

R7. For a primary control center(s) identified by the Transmission Owner according to Requirement R5, Part 5.2 that a) operationally controls an identified Transmission station or Transmission substation verified according to Requirement R6, and b) is not under the operational control of the Transmission Owner: the Transmission Owner shall, within seven calendar days following completion of Requirement R6, notify the Transmission Operator that has operational control of the primary control center of such identification and the date of completion of Requirement R6. *[Violation Risk Factor: Lower; Time-Horizon: Long-term Planning]*

7.1. If a Transmission station or Transmission substation previously identified under Requirements R1, R2, R3, R4, and R5 and verified according to Requirement R6 is removed from the identification during a subsequent risk assessment performed according to Requirement R5 or a verification according to Requirement R6, then the Transmission Owner shall, within seven calendar days following the verification or the subsequent risk assessment, notify the Transmission Operator that has operational control of the primary control center of the removal.

M7. Examples of acceptable evidence may include, but are not limited to, written or electronic notifications or communications that the Transmission Owner notified each Transmission Operator, as applicable, according to Requirement R7.

R8. Each Transmission Owner that identified a Transmission station, Transmission substation, or a primary control center in Requirement R5 and verified according to Requirement R6, and each Transmission Operator notified by a Transmission Owner according to Requirement R7, shall conduct an evaluation of the potential threats and vulnerabilities of a physical attack to each of their respective Transmission station(s), Transmission substation(s), and primary control center(s) identified in Requirement

R5 and verified according to Requirement R6. The evaluation shall consider the following: *[Violation Risk Factor: Medium; Time-Horizon: Operations Planning, Long-term Planning]*

8.1. Unique characteristics of the identified and verified Transmission station(s), Transmission substation(s), and primary control center(s);

8.2. Prior history of attack(s) on similar facilities taking into account the frequency, geographic proximity, and severity of past physical security related events; and

8.3. Intelligence or threat warnings received from sources such as law enforcement, the Electric Reliability Organization (ERO), the Electricity Sector Information Sharing and Analysis Center (E-ISAC), U.S. federal and/or Canadian governmental agencies, or their successors.

M8. Examples of evidence may include, but are not limited to, dated written or electronic documentation that the Transmission Owner or Transmission Operator conducted an evaluation of the potential threats and vulnerabilities of a physical attack to their respective Transmission station(s), Transmission substation(s), and primary control center(s) as specified in Requirement R8.

R9. Each Transmission Owner that identified a Transmission station, Transmission substation, or primary control center in Requirement R5 and verified according to Requirement R6, and each Transmission Operator notified by a Transmission Owner according to Requirement R7, shall develop and implement a documented physical security plan(s) that covers their respective Transmission station(s), Transmission substation(s), and primary control center(s). The physical security plan(s) shall be developed within 120 calendar days following the completion of Requirement R6 and executed according to the timeline specified in the physical security plan(s). The physical security plan(s) shall include the following attributes: [*Violation Risk Factor*: *High; Time-Horizon: Long-term Planning*]

9.1. Resiliency or security measures designed collectively to deter, detect, delay, assess, communicate, and respond to potential physical threats and vulnerabilities identified during the evaluation conducted in Requirement R8.

9.2. Law enforcement contact and coordination information.

9.3. A timeline for executing the physical security enhancements and modifications specified in the physical security plan.

9.4. Provisions to evaluate evolving physical threats, and their corresponding security measures, to the Transmission station(s), Transmission substation(s), or primary control center(s).

M9. Examples of evidence may include, but are not limited to, dated written or electronic documentation of its physical security plan(s) that covers their respective identified and verified Transmission station(s), Transmission substation(s), and primary control center(s) as specified in Requirement R6, and additional evidence demonstrating

execution of the physical security plan according to the timeline specified in the physical security plan.

R10. Each Transmission Owner that identified a Transmission station, Transmission substation, or primary control center in Requirement R5 and verified according to Requirement R6, and each Transmission Operator notified by a Transmission Owner according to Requirement R7, shall have an unaffiliated third party review the evaluation performed under Requirement R8 and the security plan(s) developed under Requirement R9. The review may occur concurrently with or after completion of the evaluation performed under Requirement R8 and the security plan development under Requirement R9. *[Violation Risk Factor: Medium; Time-Horizon: Long-term Planning]*

10.1. Each Transmission Owner and Transmission Operator shall select an unaffiliated third-party reviewer from the following:

- An entity or organization with electric industry physical security experience and whose review staff has at least one member who holds either a Certified Protection Professional (CPP) or Physical Security Professional (PSP) certification;
- An entity or organization approved by the ERO;
- A governmental agency with physical security expertise; or
- An entity or organization with demonstrated law enforcement, government, or military physical security expertise.

10.2. The Transmission Owner or Transmission Operator, respectively, shall ensure that the unaffiliated third-party review is completed within 90 calendar days of completing the security plan(s) developed in Requirement R9. The unaffiliated third-party review may, but is not required to, include recommended changes to the evaluation performed under Requirement R8 or the security plan(s) developed under Requirement R9.

10.3. If the unaffiliated third-party reviewer recommends changes to the evaluation performed under Requirement R8 or security plan(s) developed under Requirement R9, the Transmission Owner or Transmission Operator shall, within 60 calendar days of the completion of the unaffiliated third party review, for each recommendation:

- Modify its evaluation or security plan(s) consistent with the recommendation; or
- Document the reason(s) for not modifying the evaluation or security plan(s) consistent with the recommendation.

10.4. Each Transmission Owner and Transmission Operator shall implement procedures, such as the use of non-disclosure agreements, for protecting sensitive or confidential information made available to the unaffiliated third-party reviewer and to protect or exempt sensitive or confidential information developed pursuant to this Reliability Standard from public disclosure.

M10. Examples of evidence may include, but are not limited to, written or electronic documentation that the Transmission Owner or Transmission Operator had an unaffiliated third party review the evaluation performed under Requirement R8 and the security plan(s) developed under Requirement R9 as specified in Requirement R10 including, if applicable, documenting the reasons for not modifying the evaluation or security plan(s) in accordance with a recommendation under Part 10.3. Additionally, examples of evidence may include, but are not limited to, written or electronic documentation of procedures to protect information under Part 10.4.

C. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority: "Compliance Enforcement Authority" (CEA) means NERC or the Regional Entity in their respective roles of monitoring and enforcing compliance with the NERC Reliability Standards.

1.2. Evidence Retention: The following evidence retention period(s) identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the CEA may ask an entity to provide other evidence to show that it was compliant for the full-time period since the last audit.

The Transmission Owner and Transmission Operator shall keep data or evidence to show compliance, as identified below, unless directed by its CEA to retain specific evidence for a longer period of time as part of an investigation:

The responsible entities shall retain evidence, as per Requirements R1 through R10, for three years.

If a Responsible Entity is found non-compliant, it shall keep information related to the non-compliance until mitigation is complete and approved, or for the time specified above, whichever is longer.

The CEA shall keep the last audit records and all requested and submitted subsequent audit records.

1.3. Compliance Monitoring and Enforcement Program: "Compliance Monitoring Enforcement Program" or "CMEP" means, depending on the context (1) the NERC Compliance Monitoring and Enforcement Program (Appendix 4C to the NERC Rules of Procedure) or the Commission-approved program of a Regional Entity, as applicable, or (2) the program, department or organization within NERC or a Regional Entity that is responsible for performing compliance monitoring and enforcement activities with respect to Registered Entities' compliance with Reliability Standards.

Violation Severity Levels

	Violation Severity Levels			
	Lower VSL	Moderate VSL	High VSL	Severe VSL
R1.	The Transmission Owner identified each applicable Transmission station(s) or Transmission substation(s) per Attachment 1, but did so after 36 calendar months, but less than or equal to 38 calendar months. OR The Transmission Owner identified each applicable Transmission station(s) or Transmission substation(s), but failed to identify less than or equal to 10% of the applicable Transmission station(s) or Transmission substation(s) per Attachment 1.	The Transmission Owner identified each applicable Transmission station(s) or Transmission substation(s) per Attachment 1, but did so after 38 calendar months, but less than or equal to 40 calendar months. OR The Transmission Owner identified each applicable Transmission station(s) or Transmission substation(s), but failed to identify more than 10% and less than or equal to 20% of the applicable Transmission station(s) or Transmission substation(s) per Attachment 1.	The Transmission Owner identified each applicable Transmission station(s) or Transmission substation(s) per Attachment 1, but did so after 40 calendar months, but less than or equal to 42 calendar months. OR The Transmission Owner identified each applicable Transmission station(s) or Transmission substation(s), but failed to identify more than 20% and less than or equal to 30% of the applicable Transmission station(s) or Transmission substation(s) per Attachment 1.	The Transmission Owner failed to identify each applicable Transmission station(s) or Transmission substation(s) per Attachment 1. OR The Transmission Owner identified each applicable Transmission station(s) or Transmission substation(s) per Attachment 1, but did so after more than 42 calendar months. OR The Transmission Owner identified each applicable Transmission station(s) or Transmission substation(s), but failed to identify more than 30% of the applicable Transmission station(s) or Transmission substation(s) per Attachment 1.

	Violation Severity Levels			
	Lower VSL	Moderate VSL	High VSL	Severe VSL
R2.	N/A	N/A	N/A	The Transmission Owner did not identify proximate Transmission station(s) and Transmission substation(s), irrespective of ownership, within 1500 feet or 457 meters (the shortest distance, measured substation fence line to substation fence line) of an applicable Transmission station or Transmission substation identified in Requirement R1.
R3.	The Transmission Owner has a risk assessment methodology that failed to include one of the requirements listed in Parts 3.1 through 3.4.	The Transmission Owner has a risk assessment methodology that failed to include two of the requirements listed in Parts 3.1 through 3.4.	The Transmission Owner has a risk assessment methodology that failed to include three of the requirements listed in Parts 3.1 through 3.4.	The Transmission Owner has a risk assessment methodology that failed to include four of the requirements listed in Parts 3.1 through 3.4. OR The Transmission Owner does not have a risk assessment methodology.

	Violation Severity Levels			
	Lower VSL	Moderate VSL	High VSL	Severe VSL
R4.	The Transmission Owner with applicable Transmission station(s) and Transmission substation(s) identified in Requirement R1 containing Bulk Electric System (BES) Elements owned by multiple Transmission Owners failed to coordinate with each appropriate Transmission Owner(s) to determine and document their individual and joint responsibilities for documenting a risk assessment methodology under Requirement R3 and for performing any required risk assessments per Requirement R5 for less than or equal to 25% of jointly owned applicable Transmission station(s) and Transmission substation(s).	The Transmission Owner with applicable Transmission station(s) and Transmission substation(s) identified in Requirement R1 containing Bulk Electric System (BES) Elements owned by multiple Transmission Owners failed to coordinate with each appropriate Transmission Owner(s) to determine and document their individual and joint responsibilities for documenting a risk assessment methodology under Requirement R3 and for performing any required risk assessments per Requirement R5 for more than 25% and less than or equal to 50% of jointly owned applicable Transmission station(s) and Transmission substation(s).	The Transmission Owner with applicable Transmission station(s) and Transmission substation(s) identified in Requirement R1 containing Bulk Electric System (BES) Elements owned by multiple Transmission Owners failed to coordinate with each appropriate Transmission Owner(s) to determine and document their individual and joint responsibilities for documenting a risk assessment methodology under Requirement R3 and for performing any required risk assessments per Requirement R5 for more than 50% and less than or equal to 75% of jointly owned applicable Transmission station(s) and Transmission substation(s).	The Transmission Owner with applicable Transmission station(s) and Transmission substation(s) identified in Requirement R1 containing Bulk Electric System (BES) Elements owned by multiple Transmission Owners failed to coordinate with each appropriate Transmission Owner(s) to determine and document their individual and joint responsibilities for documenting a risk assessment methodology under Requirement R3 and for performing any required risk assessments per Requirement R5 for more than 75% and less than or equal to 100% any evidence of jointly owned applicable Transmission station(s) and Transmission substation(s).
R5.	The Transmission Owner performed a risk assessment, but did so after 36 calendar months, but less than or equal to 38 calendar months.	The Transmission Owner performed a risk assessment, but did so after 38 calendar months, but less than or equal to 40 calendar months. Attachment 1 – Applicability Criteria

Applicable Transmission station(s) or Transmission substation(s) are those that meet any of the following criteria:

1. Transmission Facilities operated at 500 kV or higher. For the purpose of this criterion, the collector bus for a generation plant is not considered a Transmission Facility, but is part of the generation interconnection Facility.

2. Transmission Facilities that are operating between 200 kV and 499 kV at a single station or substation, where the station or substation is connected at 200 kV or higher voltages to three or more other Transmission stations or substations and has an "aggregate weighted value" exceeding 3000 according to the table below. The "aggregate weighted value" for a single station or substation is determined by summing the "weight value per line" shown in the table below for each incoming and each outgoing BES Transmission Line that is connected to another Transmission station or substation. For the purpose of this criterion, the collector bus for a generation plant is not considered a Transmission Facility, but is part of the generation interconnection Facility.

Voltage Value of a Line	Weight Value per Line
less than 200 kV (not applicable)	(not applicable)
200 kV to 299 kV	700
300 kV to 499 kV	1300
500 kV and above	N/A

3. Transmission Facilities at a single station or substation location that are identified by its Reliability Coordinator, Planning Coordinator, or Transmission Planner as critical to the derivation of Interconnection Reliability Operating Limits (IROLs) and their associated contingencies.

4. Transmission Facilities identified as essential to meeting Nuclear Plant Interface Requirements (NPIRs).

Standard Development Timeline

This section is maintained by the drafting team during the development of the standard and will be removed when the standard is adopted by the NERC Board of Trustees (Board).

Description of Current Draft

CIP-014-4 is posted for a 45-day formal comment period with additional ballot.

Completed Actions	Date
Standards Committee approved Standard Authorization Request (SAR) for posting	June 21, 2023
SAR posted for comment	July 26, 2023 – August 24, 2023
Accepted Revised SAR	January 17, 2024
45-day formal or informal comment period with ballot	May 20, 2024 – July 3, 2024
45-day formal or informal comment period with additional ballot	September 23, 2024 – November 6, 2024

Anticipated Actions	Date
45-day formal comment period with additional ballot	June 6, 2025 – July 21, 2025
10-day final ballot	August 11, 2025 – August 20, 2025
Board adoption	February 11, 2026

New or Modified Term(s) Used in NERC Reliability Standards

This section includes all new or modified terms used in the proposed standard that will be included in the *Glossary of Terms Used in NERC Reliability Standards* upon applicable regulatory approval. Terms used in the proposed standard that are already defined and are not being modified can be found in the *Glossary of Terms Used in NERC Reliability Standards*. The new or revised terms listed below will be presented for approval along with the proposed standard. Upon Board adoption, this section will be removed.

Term(s):

None.

A. Introduction

1. **Title:** Physical Security

2. **Number:** CIP-014-4

3. **Purpose:** To identify and protect Transmission stations and Transmission substations, and their associated primary control centers, that if rendered inoperable or damaged ~~as a result of~~due to a physical attack, could ~~result in~~cause instability, uncontrolled separation, or Cascading within an Interconnection.

4. **Applicability:**

   4.1. Functional Entities:

   4.1.1. Transmission Owner that owns or jointly owns one or more Transmission ~~station(s)~~stations or Transmission ~~substation(s)~~substations that meet the applicability criteria of Attachment 1.

   4.1.2. Transmission Operator~~.~~

   Exemption: Facilities in a "protected area," as defined in 10 C.F.R. § 73.2, within the scope of a security plan approved or accepted by the Nuclear Regulatory Commission (NRC) are not subject to this Standard; or Facilities within the scope of a security plan approved or accepted by the Canadian Nuclear Safety Commission are not subject to this Reliability Standard.

5. **Effective Date:** See Implementation Plan for CIP-014-4.

B. Requirements and Measures

R1. Each Transmission Owner, at least once every 36 calendar months, shall ~~document a list of~~identify each applicable Transmission station~~(s)~~ and Transmission substation~~(s)~~ meeting any of the criteria in Attachment 1 that ~~are~~is either existing or planned to be in service within 36 calendar months. *[Violation Risk Factor: High; Time-Horizon: Long-term Planning]*

M1. Examples of evidence may include, but are not limited to, dated written or electronic documentation of the Transmission ~~stations~~station(s) and Transmission ~~substations~~substation(s) (existing and those planned to be in service within 36 calendar months) that meet any of the criteria in Attachment 1.

R2. Each Transmission Owner shall ~~have documented criteria to determine those~~identify proximate Transmission station(s) and Transmission substation(s), irrespective of ownership, within ~~½ mile~~1500 feet or 457 meters (the shortest distance, measured substation fence line to substation fence line) of an applicable Transmission station or Transmission substation ~~documented~~identified in Requirement R1~~, that could be impacted by a single physical attack. The criteria shall address at a minimum the following: .~~ *[Violation Risk Factor: Medium; Time-Horizon: Long-term Planning]*

~~**2.1.** Line of sight between multiple Transmission station(s) or Transmission substation(s) from a single location without obstruction.~~

~~**2.2.** Ease of access from a common roadway that exists between multiple Transmission station(s) or Transmission substation(s).~~

M2. Examples of evidence may include, but are not limited to, dated written or electronic documentation of the ~~criteria established~~Transmission stations or Transmission substations determined in Requirement R2.

R3. Each Transmission Owner shall have a documented risk assessment methodology~~,~~ ~~including criteria for steady-state and dynamic simulations,~~ for evaluating the loss ~~due to a physical attack~~ of each applicable Transmission station~~(s) and~~ or Transmission substation~~(s) documented~~ identified in Requirement R1~~ and Transmission substation(s) or Transmission station(s) determined to be in proximity per Requirement R2~~. The methodology shall include, at a minimum, the following: *[Violation Risk Factor: High; Time-Horizon: Long-term Planning]*

3.1. Documented criteria for assessing instability, uncontrolled separation, or Cascading within an Interconnection. The criteria shall include, at a minimum, thresholds identifying unacceptable generation and load loss within an Interconnection.

~~**3.1.** Technically supported thresholds and rationale for determining the amount of acceptable load loss, the amount of acceptable generation loss, post-event response, and any additional considerations recognized as resulting in instability,~~

~~uncontrolled separation, or Cascading within an Interconnection. The technical rationale shall include:~~

~~**3.1.1.** Steady-state and dynamic system response to events that could lead to load loss, generation loss, and other unacceptable post-event response within an Interconnection.~~

3.2. ~~Steady-state~~A provision that steady-state and dynamic simulations shall each be performed ~~under System conditions that are more likely to contribute to instability, uncontrolled separation, or Cascading within an Interconnection~~using a System peak Load case and a System Off-Peak Load case.

3.3. A specification for Fault simulations, including:

~~**3.2.1.** The simulations shall include the removal of all Elements that Protection Systems and other controls are expected to automatically disconnect for each event.~~

~~**3.2.2.** If steady-state and dynamic simulations each show acceptable system response but additional Elements trip during the dynamic simulation of an event, then additional steady-state analysis including any tripped Elements from the dynamic simulations shall be conducted.~~

3.3.1. ~~**3.3.**~~ For each applicable Transmission station or Transmission substation listed in accordance with Requirement R1, ~~analysis shall include~~ a Fault at the applicable Transmission station or Transmission substation ~~and~~ .

- For each Transmission station or Transmission substation ~~identified~~determined in accordance with Requirement R2 as being in proximity to ~~the~~an applicable Transmission station or Transmission substation, Faults at both the applicable and proximate Transmission station(s) or Transmission substation(s).

3.4. A specification that Fault simulations ~~that~~ assume the loss of communication and Protection ~~System~~Systems at the applicable Transmission station(s) or Transmission substation(s) prior to or simultaneous with the Fault(s) studied under Requirement R3, Parts ~~3.2~~3.3.1 and ~~3.3~~3.3.2.

3.4.1. Removal of all Elements that Protection Systems and other controls are expected to automatically disconnect for each event.

3.4.2. ~~**3.4.1.**~~ Delayed (remote) clearing times shall be used unless otherwise technically substantiated.

3.4.3. ~~**3.4.2.**~~ Actual or more conservative ~~estimates of~~ clearing times shall be used unless otherwise technically substantiated.

M3. Each Transmission Owner shall provide dated evidence, such as electronic or hard copies, of a risk assessment methodology satisfying Requirement R3.

R4. Each Transmission Owner with applicable Transmission station(s) and Transmission substation(s) ~~per~~identified in Requirement R1 containing Bulk Electric System (BES) Elements owned by multiple Transmission Owners shall coordinate with ~~those~~each appropriate Transmission ~~Owners~~Owner(s) to determine and document their individual and joint responsibilities for documenting a risk assessment methodology under Requirement R3 and for performing any required risk assessments per Requirement R5. *[~~VRF~~Violation Risk Factor: Medium; Time-Horizon: Operations Planning, Long-term Planning]*

M4. Examples of acceptable evidence may include, but are not limited to, dated documentation, such as meeting minutes, agreements, and email correspondence, that identifies that agreement has been reached on individual and joint responsibilities for performing the required risk assessments.

R5. At least once every 36 calendar months, each Transmission Owner shall perform a risk assessment to identify applicable Transmission station(s) and Transmission substation(s) identified in Requirement R1, that if rendered inoperable or damaged ~~as a result of a physical attack~~ could result in instability, uncontrolled separation, or Cascading within an Interconnection, using the methodology established in Requirement R3, including any Transmission station(s) and Transmission substation(s) identified in accordance with ~~documentation established per~~ Requirement R4. If proximate Transmission station(s) and Transmission substation(s) were identified in Requirement R2, they should also be included in the risk assessment. *[~~VRF~~Violation Risk Factor: High; Time-Horizon: Operations Planning, Long-term Planning]*

5.1. ~~A~~During the current risk assessment, a Transmission station or Transmission substation identified in either the dynamic or steady-state ~~simulations~~simulation as causing instability, uncontrolled separation, or Cascading within an Interconnection when rendered inoperable or damaged ~~as a result of a physical attack does not require any additional simulations during the current risk assessment~~requires no further simulation.

5.2. If a previous risk assessment has identified a Transmission station or Transmission substation as causing instability, uncontrolled separation, or Cascading within an Interconnection when rendered inoperable or damaged, then the Transmission Owner may forgo additional assessments on that Transmission station or Transmission substation. Requirement R5, Part 5.3 and Requirement R7 through Requirement R10 still apply to that Transmission station or Transmission substation until a new risk assessment demonstrates otherwise.

5.3. ~~**5.2.**~~ The Transmission Owner shall identify the primary control center that operationally controls each Transmission station or Transmission substation identified as causing instability, uncontrolled separation, or Cascading within an Interconnection when rendered inoperable or damaged in the Requirement R5 risk assessment.

M5. Examples of acceptable evidence may include, but are not limited to, dated written or electronic documentation of the risk assessment satisfying Requirement R5 including the identified Transmission station(s) or Transmission substation(s). For Requirement R5, Part ~~5.2~~5.3, examples of acceptable evidence may include, but are not limited to, dated written or electronic documentation of the identification of the primary control center that operationally controls each identified Transmission station or Transmission substation.

R6. Each Transmission Owner shall have an unaffiliated third party verify the risk assessment performed under Requirement R5. The verification may occur ~~concurrent~~concurrently with or after the risk assessment performed under Requirement R5. *[~~VRF~~Violation Risk Factor: Medium~~High~~; Time-Horizon: Long-term Planning]*

6.1. Each Transmission Owner shall select an unaffiliated verifying entity that is either:

- ~~**6.1.1.**~~ A registered Planning Coordinator, Transmission Planner, or Reliability Coordinator; or
- ~~**6.1.2.**~~ An entity that has transmission planning or analysis experience.

6.2. The unaffiliated third-party verification shall verify the Transmission Owner's risk assessment performed under Requirement R5, which may include recommendations for the addition or deletion of a Transmission station(s) or Transmission substation(s). The Transmission Owner shall ensure the verification is completed within 90 calendar days following the completion of the Requirement R5 risk assessment.

6.3. If the unaffiliated verifying entity recommends that the Transmission Owner add a Transmission station(s) or Transmission substation(s) to, or remove a Transmission station~~(s)~~ or Transmission substation~~(s)~~ from, its identification under Requirement R5, the Transmission Owner shall either, within 60 calendar days of completion of the verification, for each recommended addition or removal of a Transmission station or Transmission substation:

- Modify its identification under Requirement R5 consistent with the recommendation; or
- Document the technical basis for not modifying the identification in accordance with the recommendation.

6.4. Each Transmission Owner shall implement procedures, such as the use of non-disclosure agreements, for protecting sensitive or confidential information made available to the unaffiliated third-party verifier and to protect or exempt sensitive or confidential information developed pursuant to this Reliability Standard from public disclosure.

M6. Examples of acceptable evidence may include, but are not limited to, dated written or electronic documentation that the Transmission Owner completed an unaffiliated

third party verification of the Requirement R5 risk assessment and satisfied all of the applicable provisions of Requirement R6, including, if applicable, documenting the technical basis for not modifying the identification in Requirements R1, R2, R3, R4, and R5 as specified under Part 6.3. Additionally, examples of evidence may include, but are not limited to, written or electronic documentation of procedures to protect information under Part 6.4.

R7. For a primary control center(s) identified by the Transmission Owner according to Requirement R5, Part 5.2 that a) operationally controls an identified Transmission station or Transmission substation verified according to Requirement ~~R5~~R6, and b) is not under the operational control of the Transmission Owner: the Transmission Owner shall, within seven calendar days following completion of Requirement ~~R5~~R6, notify the Transmission Operator that has operational control of the primary control center of such identification and the date of completion of Requirement R6. ~~R5 . [VRF~~ *[Violation Risk Factor: Lower~~Medium~~; Time-Horizon: Long-term Planning]*

7.1. If a Transmission station or Transmission substation previously identified under Requirements R1, R2, R3, R4, and R5 and verified according to Requirement R6 is removed from the identification during a subsequent risk assessment performed according to Requirement R5 or a verification according to Requirement R6, then the Transmission Owner shall, within seven calendar days following the verification or the subsequent risk assessment, notify the Transmission Operator that has operational control of the primary control center of the removal.

M7. Examples of acceptable evidence may include, but are not limited to, written or electronic notifications or communications that the Transmission Owner notified each Transmission Operator, as applicable, according to Requirement R7.

R8. Each Transmission Owner that identified a Transmission station, Transmission substation, or a primary control center in Requirement R5 and verified according to Requirement R6, and each Transmission Operator notified by a Transmission Owner according to Requirement R7, shall conduct an evaluation of the potential threats and vulnerabilities of a physical attack to each of their respective Transmission station(s), Transmission substation(s), and primary control center(s) identified in Requirement R5 and verified according to Requirement R6. The evaluation shall consider the following: *[~~VRF~~Violation Risk Factor: Medium; Time-Horizon: Operations Planning, Long-term Planning]*

8.1. Unique characteristics of the identified and verified Transmission station(s), Transmission substation(s), and primary control center(s);

8.2. Prior history of attack(s) on similar facilities taking into account the frequency, geographic proximity, and severity of past physical security related events; and

8.3. Intelligence or threat warnings received from sources such as law enforcement, the Electric Reliability Organization (ERO), the Electricity Sector Information

Sharing and Analysis Center (~~ES-ISAC~~E-ISAC), U.S. federal and/or Canadian governmental agencies, or their successors.

M8. Examples of evidence may include, but are not limited to, dated written or electronic documentation that the Transmission Owner or Transmission Operator conducted an evaluation of the potential threats and vulnerabilities of a physical attack to their respective Transmission station(s), Transmission substation(s), and primary control center(s) as specified in Requirement R8.

R9. Each Transmission Owner that identified a Transmission station, Transmission substation, or primary control center in Requirement R5 and verified according to Requirement R6, and each Transmission Operator notified by a Transmission Owner according to Requirement R7, shall develop and implement a documented physical security plan(s) that covers their respective Transmission station(s), Transmission substation(s), and primary control center(s). The physical security plan(s) shall be developed within 120 calendar days following the completion of Requirement R6 and executed according to the timeline specified in the physical security plan(s). The physical security plan(s) shall include the following attributes: [*Violation Risk Factor*: *High; Time-Horizon: Long-term Planning*]

9.1. Resiliency or security measures designed collectively to deter, detect, delay, assess, communicate, and respond to potential physical threats and vulnerabilities identified during the evaluation conducted in Requirement R8.

9.2. Law enforcement contact and coordination information.

9.3. A timeline for executing the physical security enhancements and modifications specified in the physical security plan.

9.4. Provisions to evaluate evolving physical threats, and their corresponding security measures, to the Transmission station(s), Transmission substation(s), or primary control center(s).

M9. Examples of evidence may include, but are not limited to, dated written or electronic documentation of its physical security plan(s) that covers their respective identified and verified Transmission station(s), Transmission substation(s), and primary control center(s) as specified in Requirement R6, and additional evidence demonstrating execution of the physical security plan according to the timeline specified in the physical security plan.

R10. Each Transmission Owner that identified a Transmission station, Transmission substation, or primary control center in Requirement R5 and verified according to Requirement R6, and each Transmission Operator notified by a Transmission Owner according to Requirement R7, shall have an unaffiliated third party review the evaluation performed under Requirement R8 and the security plan(s) developed under Requirement R9. The review may occur concurrently with or after completion of the evaluation performed under Requirement R8 and the security plan

development under Requirement R9. *[~~VRF~~Violation Risk Factor: Medium; Time-Horizon: Long-term Planning]*

10.1. Each Transmission Owner and Transmission Operator shall select an unaffiliated third-party reviewer from the following:

- An entity or organization with electric industry physical security experience and whose review staff has at least one member who holds either a Certified Protection Professional (CPP) or Physical Security Professional (PSP) certification~~.~~;
- An entity or organization approved by the ERO~~.~~;
- A governmental agency with physical security expertise~~.~~; or
- An entity or organization with demonstrated law enforcement, government, or military physical security expertise.

10.2. The Transmission Owner or Transmission Operator, respectively, shall ensure that the unaffiliated third-party review is completed within 90 calendar days of completing the security plan(s) developed in Requirement R9. The unaffiliated third-party review may, but is not required to, include recommended changes to the evaluation performed under Requirement R8 or the security plan(s) developed under Requirement R9.

10.3. If the unaffiliated third-party reviewer recommends changes to the evaluation performed under Requirement R8 or security plan(s) developed under Requirement R9, the Transmission Owner or Transmission Operator shall, within 60 calendar days of the completion of the unaffiliated third party review, for each recommendation:

- Modify its evaluation or security plan(s) consistent with the recommendation; or
- Document the reason(s) for not modifying the evaluation or security plan(s) consistent with the recommendation.

10.4. Each Transmission Owner and Transmission Operator shall implement procedures, such as the use of non-disclosure agreements, for protecting sensitive or confidential information made available to the unaffiliated third-party reviewer and to protect or exempt sensitive or confidential information developed pursuant to this Reliability Standard from public disclosure.

M10. Examples of evidence may include, but are not limited to, written or electronic documentation that the Transmission Owner or Transmission Operator had an unaffiliated third party review the evaluation performed under Requirement R8 and the security plan(s) developed under Requirement R9 as specified in Requirement R10 including, if applicable, documenting the reasons for not modifying the evaluation or security plan(s) in accordance with a recommendation under Part 10.3. Additionally,

examples of evidence may include, but are not limited to, written or electronic documentation of procedures to protect information under Part 10.4.

C. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority: "Compliance Enforcement Authority" (CEA) means NERC or the Regional Entity~~, or any entity as otherwise designated by an Applicable Governmental Authority,~~ in their respective roles of monitoring and~~/or~~ enforcing compliance with ~~mandatory and enforceable~~the NERC Reliability Standards~~ in their respective jurisdictions~~.

1.2. Evidence Retention: The following evidence retention period(s) identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the ~~Compliance Enforcement Authority~~CEA may ask an entity to provide other evidence ~~during an on-site visit~~ to show that it was compliant for the full-time period since the last audit.

The Transmission Owner and Transmission Operator shall keep data or evidence to show compliance, as identified below, unless directed by its ~~Compliance Enforcement Authority (~~CEA~~)~~ to retain specific evidence for a longer period of time as part of an investigation:

The responsible entities shall retain evidence, as per Requirements R1 through R10, for three years.

If a Responsible Entity is found non-compliant, it shall keep information related to the non-compliance until mitigation is complete and approved, or for the time specified above, whichever is longer.

The ~~Compliance Enforcement Authority~~CEA shall keep the last audit records and all requested and submitted subsequent audit records.

1.3. Compliance Monitoring and Enforcement Program: ~~As defined in~~"Compliance Monitoring Enforcement Program" or "CMEP" means, depending on the context (1) the NERC ~~Rules of Procedure, "~~Compliance Monitoring and Enforcement Program~~" refers to the identification of the processes that will be used to evaluate data or information for the purpose of assessing performance or outcomes with the associated~~ (Appendix 4C to the NERC Rules of Procedure) or the Commission-approved program of a Regional Entity, as applicable, or (2) the program, department or organization within NERC or a Regional Entity that is responsible for performing compliance monitoring and enforcement activities with respect to Registered Entities' compliance with Reliability ~~Standard~~Standards.

Attachment 1 – Applicability Criteria

Applicable Transmission station(s) or Transmission substation(s) are those that meet any of the following criteria:

1. Transmission Facilities operated at 500 kV or higher. For the purpose of this criterion, the collector bus for a generation plant is not considered a Transmission Facility, but is part of the generation interconnection Facility.

2. Transmission Facilities that are operating between 200 kV and 499 kV at a single station or substation, where the station or substation is connected at 200 kV or higher voltages to three or more other Transmission stations or substations and has an "aggregate weighted value" exceeding 3000 according to the table below. The "aggregate weighted value" for a single station or substation is determined by summing the "weight value per line" shown in the table below for each incoming and each outgoing BES Transmission Line that is connected to another Transmission station or substation. For the purpose of this criterion, the collector bus for a generation plant is not considered a Transmission Facility, but is part of the generation interconnection Facility.

Voltage Value of a Line	Weight Value per Line
less than 200 kV (not applicable)	(not applicable)
200 kV to 299 kV	700
300 kV to 499 kV	1300
500 kV and above	~~0~~N/A

3. Transmission Facilities at a single station or substation location that are identified by its Reliability Coordinator, Planning Coordinator, or Transmission Planner as critical to the derivation of Interconnection Reliability Operating Limits (IROLs) and their associated contingencies.

4. Transmission Facilities identified as essential to meeting Nuclear Plant Interface Requirements (NPIRs).

Standard Development Timeline

This section is maintained by the drafting team during the development of the standard and will be removed when the standard is adopted by the NERC Board of Trustees (Board).

Description of Current Draft

CIP-014-4 is posted for a 45-day formal comment period with additional ballot.

Completed Actions	Date
Standards Committee approved Standard Authorization Request (SAR) for posting	June 21, 2023
SAR posted for comment	July 26, 2023 – August 24, 2023
Accepted Revised SAR	January 17, 2024
45-day formal or informal comment period with ballot	May 20, 2024 – July 3, 2024
45-day formal or informal comment period with additional ballot	September 23, 2024 – November 6, 2024

Anticipated Actions	Date
45-day formal comment period with additional ballot	June 6, 2025 – July 21, 2025
10-day final ballot	August 11, 2025 – August 20, 2025
Board adoption	February 11, 2026

New or Modified Term(s) Used in NERC Reliability Standards

This section includes all new or modified terms used in the proposed standard that will be included in the *Glossary of Terms Used in NERC Reliability Standards* upon applicable regulatory approval. Terms used in the proposed standard that are already defined and are not being modified can be found in the *Glossary of Terms Used in NERC Reliability Standards*. The new or revised terms listed below will be presented for approval along with the proposed standard. Upon Board adoption, this section will be removed.

Term(s):

None.

A. Introduction

1. **Title:** Physical Security

2. **Number:** CIP-~~014-3~~014-4

3. **Purpose:** To identify and protect Transmission stations and Transmission substations, and their associated primary control centers, that if rendered inoperable or damaged ~~as a result of~~due to a physical attack, could ~~result in~~cause instability, uncontrolled separation, or Cascading within an Interconnection.

4. **Applicability:**

   4.1. Functional Entities:

   4.1.1. ~~**4.1.1**~~ Transmission Owner that owns ~~**a**~~or jointly owns one or more Transmission ~~**station**~~stations or Transmission ~~**substation that meets any of the following**~~substations that meet the applicability criteria~~:~~ of Attachment 1.

   ~~**4.1.1.1** Transmission Facilities operated at 500 kV or higher. For the purpose of this criterion, the collector bus for a generation plant is not considered a Transmission Facility, but is part of the generation interconnection Facility.~~

   ~~**4.1.1.2** Transmission Facilities that are operating between 200 kV and 499 kV at a single station or substation, where the station or substation is connected at 200 kV or higher voltages to three or more other Transmission stations or substations and has an "aggregate weighted value" exceeding 3000 according to the table below. The "aggregate weighted value" for a single station or substation is determined by summing the "weight value per line" shown in the table below for each incoming and each outgoing BES Transmission Line that is connected to another Transmission station or substation. For the purpose of this criterion, the collector bus for a generation plant is not considered a Transmission Facility, but is part of the generation interconnection Facility.~~

~~**Voltage Value of a Line**~~	~~**Weight Value per Line**~~
~~less than 200 kV (not applicable)~~	~~(not applicable)~~
~~200 kV to 299 kV~~	~~700~~
~~300 kV to 499 kV~~	~~1300~~
~~500 kV and above~~	~~0~~

   ~~**4.1.1.3** Transmission Facilities at a single station or substation location that are identified by its Reliability Coordinator, Planning Coordinator, or Transmission Planner as critical to the derivation of Interconnection~~

~~Reliability Operating Limits (IROLs) and their associated contingencies.~~

~~**4.1.1.4** Transmission Facilities identified as essential to meeting Nuclear Plant Interface Requirements.~~

4.1.2. ~~**4.1.2**~~ Transmission Operator~~.~~

Exemption: Facilities in a "protected area," as defined in 10 C.F.R. § 73.2, within the scope of a security plan approved or accepted by the Nuclear Regulatory Commission (NRC) are not subject to this Standard; or~~;~~ Facilities within the scope of a security plan approved or accepted by the Canadian Nuclear Safety Commission are not subject to this Reliability Standard.

5. ~~5.~~ Effective ~~Dates~~Date:

See Implementation Plan for CIP-~~014-2~~014-4.

~~6. Background:~~

~~This Reliability Standard addresses the directives from the FERC order issued March 7, 2014, *Reliability Standards for Physical Security Measures*, 146 FERC ¶ 61,166 (2014), which required NERC to develop a physical security reliability standard(s) to identify and protect facilities that if rendered inoperable or damaged could result in instability, uncontrolled separation, or Cascading within an Interconnection.~~

B. Requirements and Measures

R1. Each Transmission Owner, at least once every 36 calendar months, shall identify each applicable Transmission station and Transmission substation meeting any of the criteria in Attachment 1 that is either existing or planned to be in service within 36 calendar months. *[Violation Risk Factor: High; Time-Horizon: Long-term Planning]*

M1. Examples of evidence may include, but are not limited to, dated written or electronic documentation of the Transmission station(s) and Transmission substation(s) (existing and those planned to be in service within 36 calendar months) that meet any of the criteria in Attachment 1.

R2. Each Transmission Owner shall identify proximate Transmission station(s) and Transmission substation(s), irrespective of ownership, within 1500 feet or 457 meters (the shortest distance, measured substation fence line to substation fence line) of an applicable Transmission station or Transmission substation identified in Requirement R1. *[Violation Risk Factor: Medium; Time-Horizon: Long-term Planning]*

M2. Examples of evidence may include, but are not limited to, dated written or electronic documentation of the Transmission stations or Transmission substations determined in Requirement R2.

R3. Each Transmission Owner shall have a documented risk assessment methodology for evaluating the loss of each applicable Transmission station or Transmission substation identified in Requirement R1. The methodology shall include, at a minimum, the following: *[Violation Risk Factor: High; Time-Horizon: Long-term Planning]*

3.1. Documented criteria for assessing instability, uncontrolled separation, or Cascading within an Interconnection. The criteria shall include, at a minimum, thresholds identifying unacceptable generation and load loss within an Interconnection.

3.2. A provision that steady-state and dynamic simulations shall each be performed using a System peak Load case and a System Off-Peak Load case.

3.3. A specification for Fault simulations, including:

3.3.1. For each applicable Transmission station or Transmission substation listed in accordance with Requirement R1, a Fault at the applicable Transmission station or Transmission substation.

3.3.2. For each Transmission station or Transmission substation determined in accordance with Requirement R2 as being in proximity to an applicable Transmission station or Transmission substation, Faults at both the applicable and proximate Transmission station(s) or Transmission substation(s).

3.4. A specification that Fault simulations assume the loss of communication and Protection Systems at the applicable Transmission station(s) or Transmission

substation(s) prior to or simultaneous with the Fault(s) studied under Requirement R3, Parts 3.3.1 and 3.3.2.

3.4.1. Removal of all Elements that Protection Systems and other controls are expected to automatically disconnect for each event.

3.4.2. Delayed (remote) clearing times shall be used unless otherwise technically substantiated.

3.4.3. Actual or more conservative clearing times shall be used unless otherwise technically substantiated.

M3. Each Transmission Owner shall provide dated evidence, such as electronic or hard copies, of a risk assessment methodology satisfying Requirement R3.

R4. Each Transmission Owner with applicable Transmission station(s) and Transmission substation(s) identified in Requirement R1 containing Bulk Electric System (BES) Elements owned by multiple Transmission Owners shall coordinate with each appropriate Transmission Owner(s) to determine and document their individual and joint responsibilities for documenting a risk assessment methodology under Requirement R3 and for performing any required risk assessments per Requirement R5. *[Violation Risk Factor: Medium; Time-Horizon: Operations Planning, Long-term Planning]*

M4. Examples of acceptable evidence may include, but are not limited to, dated documentation, such as meeting minutes, agreements, and email correspondence, that identifies that agreement has been reached on individual and joint responsibilities for performing the required risk assessments.

R5. At least once every 36 calendar months, each Transmission Owner shall perform a risk assessment to identify applicable Transmission station(s) and Transmission substation(s) identified in Requirement R1, that if rendered inoperable or damaged could result in instability, uncontrolled separation, or Cascading within an Interconnection, using the methodology established in Requirement R3, including any Transmission station(s) and Transmission substation(s) identified in accordance with Requirement R4. If proximate Transmission station(s) and Transmission substation(s) were identified in Requirement R2, they should also be included in the risk assessment. *[Violation Risk Factor: High; Time-Horizon: Operations Planning, Long-term Planning]*

5.1. During the current risk assessment, a Transmission station or Transmission substation identified in either the dynamic or steady-state simulation as causing instability, uncontrolled separation, or Cascading within an Interconnection when rendered inoperable or damaged requires no further simulation.

5.2. If a previous risk assessment has identified a Transmission station or Transmission substation as causing instability, uncontrolled separation, or Cascading within an Interconnection when rendered inoperable or damaged,

then the Transmission Owner may forgo additional assessments on that Transmission station or Transmission substation. Requirement R5, Part 5.3 and Requirement R7 through Requirement R10 still apply to that Transmission station or Transmission substation until a new risk assessment demonstrates otherwise.

5.3. The Transmission Owner shall identify the primary control center that operationally controls each Transmission station or Transmission substation identified as causing instability, uncontrolled separation, or Cascading within an Interconnection when rendered inoperable or damaged in the Requirement R5 risk assessment.

M5. Examples of acceptable evidence may include, but are not limited to, dated written or electronic documentation of the risk assessment satisfying Requirement R5 including the identified Transmission station(s) or Transmission substation(s). For Requirement R5, Part 5.3, examples of acceptable evidence may include, but are not limited to, dated written or electronic documentation of the identification of the primary control center that operationally controls each identified Transmission station or Transmission substation.

~~R1. Each Transmission Owner shall perform an initial risk assessment and subsequent risk assessments of its Transmission stations and Transmission substations (existing and planned to be in service within 24 months) that meet the criteria specified in Applicability Section 4.1.1. The initial and subsequent risk assessments shall consist of a transmission analysis or transmission analyses designed to identify the Transmission station(s) and Transmission substation(s) that if rendered inoperable or damaged could result in instability, uncontrolled separation, or Cascading within an Interconnection. [VRF: High; Time Horizon: Long-term Planning]~~

~~1.1. Subsequent risk assessments shall be performed:~~

- ~~At least once every 30 calendar months for a Transmission Owner that has identified in its previous risk assessment (as verified according to Requirement R2) one or more Transmission stations or Transmission substations that if rendered inoperable or damaged could result in instability, uncontrolled separation, or Cascading within an Interconnection; or~~
- ~~At least once every 60 calendar months for a Transmission Owner that has not identified in its previous risk assessment (as verified according to Requirement R2) any Transmission stations or Transmission substations that if rendered inoperable or damaged could result in instability, uncontrolled separation, or Cascading within an Interconnection.~~

~~1.2. The Transmission Owner shall identify the primary control center that operationally controls each Transmission station or Transmission substation identified in the Requirement R1 risk assessment.~~

~~M1. Examples of acceptable evidence may include, but are not limited to, dated written or electronic documentation of the risk assessment of its Transmission stations and Transmission substations (existing and planned to be in service within 24 months) that meet the criteria in Applicability Section 4.1.1 as specified in Requirement R1. Additionally, examples of acceptable evidence may include, but are not limited to, dated written or electronic documentation of the identification of the primary control center that operationally controls each Transmission station or Transmission substation identified in the Requirement R1 risk assessment as specified in Requirement R1, Part 1.2.~~

R6. ~~**R2.**~~ Each Transmission Owner shall have an unaffiliated third-party verify the risk assessment performed under Requirement ~~R1~~R5. The verification may occur ~~concurrent~~concurrently with or after the risk assessment performed under Requirement ~~R1. *[VRF: Medium*~~R5. *[Violation Risk Factor: Medium; Time-Horizon: Long-term Planning]*

6.1. ~~**2.1.**~~ Each Transmission Owner shall select an unaffiliated verifying entity that is either:

- A registered Planning Coordinator, Transmission Planner, or Reliability Coordinator; or
- An entity that has transmission planning or analysis experience.

6.2. ~~**2.2.**~~ The unaffiliated third-party verification shall verify the Transmission Owner's risk assessment performed under Requirement ~~R1~~R5, which may include recommendations for the addition or deletion of a Transmission station(s) or Transmission substation(s). The Transmission Owner shall ensure the verification is completed within 90 calendar days following the completion of the Requirement ~~R1~~R5 risk assessment.

6.3. ~~**2.3.**~~ If the unaffiliated verifying entity recommends that the Transmission Owner add a Transmission station(s) or Transmission substation(s) to, or remove a Transmission station~~(s)~~ or Transmission substation~~(s)~~ from, its identification under Requirement ~~R1~~R5, the Transmission Owner shall either, within 60 calendar days of completion of the verification, for each recommended addition or removal of a Transmission station or Transmission substation:

- Modify its identification under Requirement ~~R1~~R5 consistent with the recommendation; or
- Document the technical basis for not modifying the identification in accordance with the recommendation.

6.4. ~~**2.4.**~~ Each Transmission Owner shall implement procedures, such as the use of non-disclosure agreements, for protecting sensitive or confidential information made available to the unaffiliated third-party verifier and to protect or exempt

sensitive or confidential information developed pursuant to this Reliability Standard from public disclosure.

M6. ~~**M2.**~~ Examples of acceptable evidence may include, but are not limited to, dated written or electronic documentation that the Transmission Owner completed an unaffiliated third party verification of the Requirement ~~R1~~R5 risk assessment and satisfied all of the applicable provisions of Requirement ~~R2~~R6, including, if applicable, documenting the technical basis for not modifying the ~~Requirement R1~~ identification in Requirements R1, R2, R3, R4, and R5 as specified under Part ~~2.3~~6.3. Additionally, examples of evidence may include, but are not limited to, written or electronic documentation of procedures to protect information under Part ~~2.4~~6.4.

R7. ~~**R3.**~~ For a primary control center(s) identified by the Transmission Owner according to Requirement ~~R1~~R5, Part ~~1.2~~5.2 that a) operationally controls an identified Transmission station or Transmission substation verified according to Requirement ~~R2~~R6, and b) is not under the operational control of the Transmission Owner: the Transmission Owner shall, within seven calendar days following completion of Requirement ~~R2~~R6, notify the Transmission Operator that has operational control of the primary control center of such identification and the date of completion of Requirement ~~R2. *[VRF: Lower*~~R6. *[Violation Risk Factor: Lower; Time-Horizon: Long-term Planning]*

7.1. ~~**3.1.**~~ If a Transmission station or Transmission substation previously identified under ~~Requirement~~Requirements R1, R2, R3, R4, and R5 and verified according to Requirement ~~R2~~R6 is removed from the identification during a subsequent risk assessment performed according to Requirement ~~R1~~R5 or a verification according to Requirement ~~R2~~R6, then the Transmission Owner shall, within seven calendar days following the verification or the subsequent risk assessment, notify the Transmission Operator that has operational control of the primary control center of the removal.

M7. ~~**M3.**~~ Examples of acceptable evidence may include, but are not limited to, ~~dated~~ written or electronic notifications or communications that the Transmission Owner notified each Transmission Operator, as applicable, according to Requirement ~~R3~~R7.

R8. ~~**R4.**~~ Each Transmission Owner that identified a Transmission station, Transmission substation, or a primary control center in Requirement ~~R1~~R5 and verified according to Requirement ~~R2~~R6, and each Transmission Operator notified by a Transmission Owner according to Requirement ~~R3~~R7, shall conduct an evaluation of the potential threats and vulnerabilities of a physical attack to each of their respective Transmission station(s), Transmission substation(s), and primary control center(s) identified in Requirement ~~R1~~R5 and verified according to Requirement ~~R2~~R6. The evaluation shall consider the following: *[~~VRF~~Violation Risk Factor: Medium; Time-Horizon: Operations Planning, Long-term Planning]*

8.1. ~~**4.1.**~~ Unique characteristics of the identified and verified Transmission station(s), Transmission substation(s), and primary control center(s);

8.2. ~~**4.2.**~~ Prior history of attack(s) on similar facilities taking into account the frequency, geographic proximity, and severity of past physical security related events; and

8.3. ~~**4.3.**~~ Intelligence or threat warnings received from sources such as law enforcement, the Electric Reliability Organization (ERO), the Electricity Sector Information Sharing and Analysis Center (E~~S~~-ISAC), U.S. federal and/or Canadian governmental agencies, or their successors.

~~**M4**~~**M8.** Examples of evidence may include, but are not limited to, dated written or electronic documentation that the Transmission Owner or Transmission Operator conducted an evaluation of the potential threats and vulnerabilities of a physical attack to their respective Transmission station(s), Transmission substation(s), and primary control center(s) as specified in Requirement ~~R4~~R8.

R9. ~~**R5.**~~ Each Transmission Owner that identified a Transmission station, Transmission substation, or primary control center in Requirement ~~R1~~R5 and verified according to Requirement ~~R2~~R6, and each Transmission Operator notified by a Transmission Owner according to Requirement ~~R3~~R7, shall develop and implement a documented physical security plan(s) that covers their respective Transmission station(s), Transmission substation(s), and primary control center(s). The physical security plan(s) shall be developed within 120 calendar days following the completion of Requirement ~~R2~~R6 and executed according to the timeline specified in the physical security plan(s). The physical security plan(s) shall include the following attributes: [~~*VRF*~~*Violation Risk Factor*: *High; Time-Horizon: Long-term Planning*]

9.1. ~~**5.1.**~~ Resiliency or security measures designed collectively to deter, detect, delay, assess, communicate, and respond to potential physical threats and vulnerabilities identified during the evaluation conducted in Requirement ~~R4~~R8.

9.2. ~~**5.2.**~~ Law enforcement contact and coordination information.

9.3. ~~**5.3.**~~ A timeline for executing the physical security enhancements and modifications specified in the physical security plan.

9.4. ~~**5.4.**~~ Provisions to evaluate evolving physical threats, and their corresponding security measures, to the Transmission station(s), Transmission substation(s), or primary control center(s).

~~**M5**~~**M9.** Examples of evidence may include, but are not limited to, dated written or electronic documentation of its physical security plan(s) that covers their respective identified and verified Transmission station(s), Transmission substation(s), and primary control center(s) as specified in Requirement ~~R5~~R6, and additional evidence demonstrating execution of the physical security plan according to the timeline specified in the physical security plan.

R10. ~~**R6.**~~ Each Transmission Owner that identified a Transmission station, Transmission substation, or primary control center in Requirement ~~R1~~R5 and verified according to Requirement ~~R2~~R6, and each Transmission Operator notified by a Transmission Owner according to Requirement ~~R3~~R7, shall have an unaffiliated third party review the evaluation performed under Requirement ~~R4~~R8 and the security plan(s) developed under Requirement ~~R5~~R9. The review may occur concurrently with or after completion of the evaluation performed under Requirement ~~R4~~R8 and the security plan development under Requirement ~~R5. *[VRF*~~R9. *[Violation Risk Factor: Medium; Time-Horizon: Long-term Planning]*

10.1. ~~**6.1.**~~ Each Transmission Owner and Transmission Operator shall select an unaffiliated third-party reviewer from the following:

- An entity or organization with electric industry physical security experience and whose review staff has at least one member who holds either a Certified Protection Professional (CPP) or Physical Security Professional (PSP) certification~~.~~;
- An entity or organization approved by the ERO~~.~~;
- A governmental agency with physical security expertise~~.~~; or
- An entity or organization with demonstrated law enforcement, government, or military physical security expertise.

10.2. ~~**6.2.**~~ The Transmission Owner or Transmission Operator, respectively, shall ensure that the unaffiliated third-party review is completed within 90 calendar days of completing the security plan(s) developed in Requirement ~~R5~~R9. The unaffiliated third-party review may, but is not required to, include recommended changes to the evaluation performed under Requirement ~~R4~~R8 or the security plan(s) developed under Requirement ~~R5~~R9.

10.3. ~~**6.3.**~~ If the unaffiliated third-party reviewer recommends changes to the evaluation performed under Requirement ~~R4~~R8 or security plan(s) developed under Requirement ~~R5~~R9, the Transmission Owner or Transmission Operator shall, within 60 calendar days of the completion of the unaffiliated third party review, for each recommendation:

- Modify its evaluation or security plan(s) consistent with the recommendation; or
- Document the reason(s) for not modifying the evaluation or security plan(s) consistent with the recommendation.

10.4. ~~**6.4.**~~ Each Transmission Owner and Transmission Operator shall implement procedures, such as the use of non-disclosure agreements, for protecting sensitive or confidential information made available to the unaffiliated ~~third party~~third-party reviewer and to protect or exempt sensitive or confidential

information developed pursuant to this Reliability Standard from public disclosure.

~~M6~~M10. Examples of evidence may include, but are not limited to, written or electronic documentation that the Transmission Owner or Transmission Operator had an unaffiliated third party review the evaluation performed under Requirement ~~R4~~R8 and the security plan(s) developed under Requirement ~~R5~~R9 as specified in Requirement ~~R6~~R10 including, if applicable, documenting the reasons for not modifying the evaluation or security plan(s) in accordance with a recommendation under Part ~~6.3~~10.3. Additionally, examples of evidence may include, but are not limited to, written or electronic documentation of procedures to protect information under Part ~~6.4~~10.4.

C. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority

~~: As defined in the NERC Rules of Procedure,~~ "Compliance Enforcement Authority" (CEA) means NERC or the Regional Entity in their respective roles of monitoring and enforcing compliance with the NERC Reliability Standards.

~~**1.2. Evidence Retention**~~

1.2. Evidence Retention: The following evidence retention ~~periods~~period(s) identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the CEA may ask an entity to provide other evidence ~~during an on-site visit~~ to show that it was compliant for the ~~full time~~full-time period since the last audit.

The Transmission Owner and Transmission Operator shall keep data or evidence to show compliance, as identified below, unless directed by its ~~Compliance Enforcement Authority (~~CEA~~)~~ to retain specific evidence for a longer period of time as part of an investigation~~.~~:

The responsible entities shall retain ~~documentation as~~ evidence, as per Requirements R1 through R10, for three years.

If a Responsible Entity is found non-compliant, it shall keep information related to the non-compliance until mitigation is complete and approved, or for the time specified above, whichever is longer.

The CEA shall keep the last audit records and all requested and submitted subsequent audit records~~, subject to the confidentiality provisions of Section 1500 of the Rules of Procedure and the provisions of Section 1.4 below~~.

~~**1.3. Compliance Monitoring and Assessment Processes:**~~

~~Compliance Audits~~

~~Self-Certifications~~
~~Spot Checking~~

1.3. Compliance Monitoring and Enforcement Program: "Compliance Monitoring Enforcement Program" or "CMEP" means, depending on the context (1) the NERC Compliance Monitoring and Enforcement Program (Appendix 4C to the NERC Rules of Procedure) or the Commission-approved program of a Regional Entity, as applicable, or (2) the program, department or organization within NERC or a Regional Entity that is responsible for performing compliance monitoring and enforcement activities with respect to Registered Entities' compliance with Reliability Standards.

Guidelines and Technical Basis

Section 4Attachment 1 — Applicability Criteria

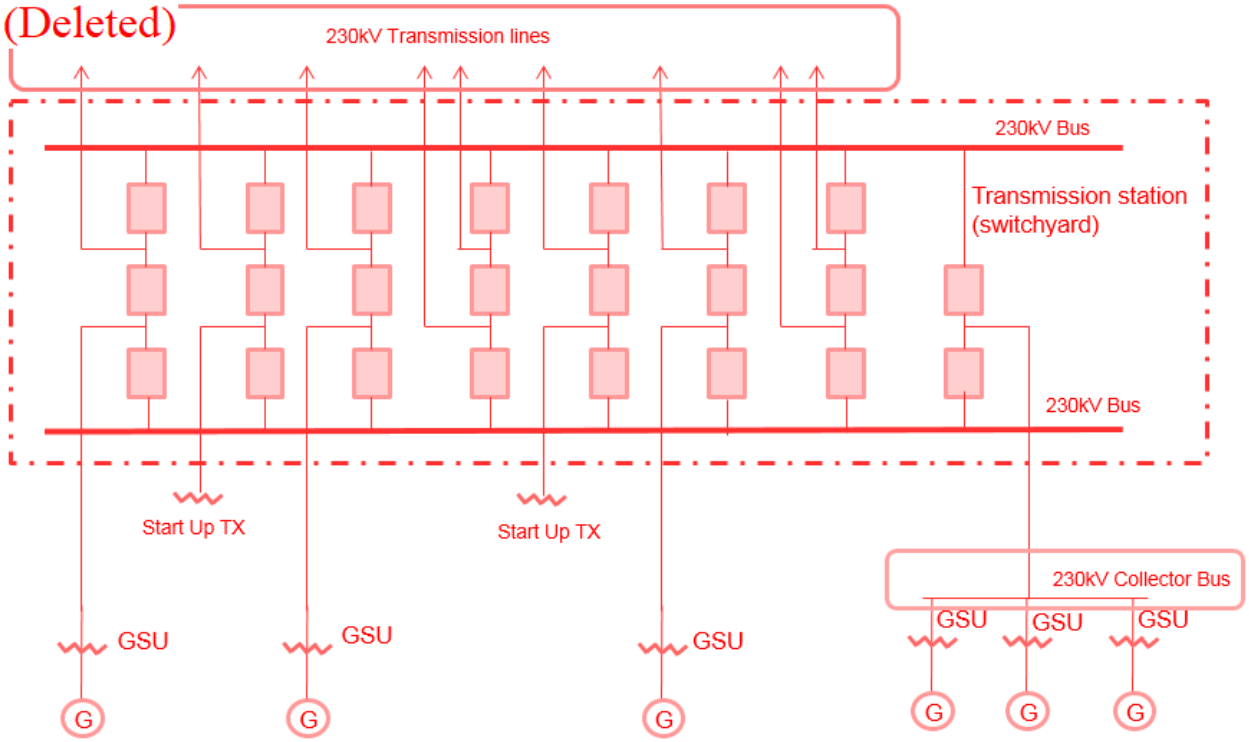
The purpose of Reliability Standard CIP-014 is to protect Transmission stations and Transmission substations, and their associated primary control centers that if rendered inoperable or damaged as a result of a physical attack could result in instability, uncontrolled separation, or Cascading within an Interconnection. To properly include those entities that own or operate such Facilities, the Reliability Standard CIP-014 first applies to Transmission Owners that own Transmission Facilities that meet the specific criteria in Applicability Section 4.1.1.1 through 4.1.1.4. The Facilities described in Applicability Section 4.1.1.1 through 4.1.1.4 mirror those Transmission Facilities that meet the bright line criteria for "Medium Impact" Transmission Facilities under Attachment 1 of Reliability Standard CIP-002-5.1. Each Transmission Owner that owns Transmission Facilities that meet the criteria in Section 4.1.1.1 through 4.1.1.4 is required to perform a risk assessment as specified in Requirement R1 to identify its Transmission stations and Transmission substations, and their associated primary control centers, that if rendered inoperable or damaged as a result of a physical attack could result in instability, uncontrolled separation, or Cascading within an Interconnection. The Standard Drafting Team (SDT) expects this population will be small and that many Transmission Owners that meet the applicability of this standard will not actually identify any such Facilities. Only those Transmission Owners with Transmission stations or Transmission substations identified in the risk assessment (and verified under Requirement R2) have performance obligations under Requirements R3 through R6.

This standard also applies to Transmission Operators. A Transmission Operator's obligations under the standard, however, are only triggered if the Transmission Operator is notified by an applicable Transmission Owner under Requirement R3 that the Transmission Operator operates a primary control center that operationally controls a Transmission station(s) or Transmission substation(s) identified in the Requirement R1 risk assessment. A primary control center operationally controls a Transmission station or Transmission substation when the control center's electronic actions can cause direct physical action at the identified Transmission station or Transmission substation, such as opening a breaker, as opposed to a control center that only has information from the Transmission station or Transmission substation and must coordinate direct action through another entity. Only Transmission Operators who are notified that they have primary control centers under this standard have performance obligations under Requirements R4 through R6. In other words, primary control center for purposes of this Standard is the control center that the Transmission Owner or Transmission Operator, respectively, uses as its primary, permanently-manned site to physically operate a Transmission station or Transmission substation that is identified in Requirement R1 and verified in Requirement R2. Control centers that provide back-up capability are not applicable, as they are a form of resiliency and intentionally redundant.

The SDT considered several options for bright line criteria that could be used to determine applicability and provide an initial threshold that defines the set of Transmission stations and Transmission substations that would meet the directives of the FERC order on physical security (*i.e.*, those that could cause instability, uncontrolled separation, or Cascading within an

Interconnection). The SDT determined that using the criteria for Medium Impact Transmission Facilities in Attachment 1 of CIP-002-5.1 would provide a conservative threshold for defining which Transmission stations and Transmission substations must be included in the risk assessment in Requirement R1 of CIP-014. Additionally, the SDT concluded that using the CIP-002-5.1 Medium Impact criteria was appropriate because it has been approved by stakeholders, NERC, and FERC, and its use provides a technically sound basis to determine which Transmission Owners should conduct the risk assessment. As described in CIP-002-5.1, the failure of a Transmission station or Transmission substation that meets the Medium Impact criteria could have the capability to result in exceeding one or more Interconnection Reliability Operating Limits (IROLs). The SDT understands that using this bright line criteria to determine applicability may require some Transmission Owners to perform risk assessments under Requirement R1 that will result in a finding that none of their Transmission stations or Transmission substations would pose a risk of instability, uncontrolled separation, or Cascading within an Interconnection. However, the SDT determined that higher bright lines could not be technically justified to ensure inclusion of all Transmission stations and Transmission substations, and their associated primary control centers that, if rendered inoperable or damaged as a result of a physical attack could result in instability, uncontrolled separation, or Cascading within an Interconnection. Further guidance and technical basis for the bright line criteria for Medium Impact Facilities can be found in the Guidelines and Technical Basis section of CIP-002-5.1.

Additionally, the SDT determined that it was not necessary to include Generator Operators and Generator Owners in the Reliability Standard. First, Transmission stations or Transmission substations interconnecting generation facilities are considered when determining applicability. Transmission Owners will consider those Transmission stations and Transmission substations that include a Transmission station on the high side of the Generator Step-up transformer (GSU) using Applicability Section 4.1.1.1 and 4.1.1.2. As an example, a Transmission station or Transmission substation identified as a Transmission Owner facility that interconnects generation will be subject to the Requirement R1 risk assessment if it operates at 500kV or greater or if it is connected at 200 kV – 499kV to three or more other Transmission stations or Transmission substations and has an "aggregate weighted value" exceeding 3000 according to the table in Applicability Section 4.1.1.2. Second, the Transmission analysis or analyses conducted under Requirement R1 should take into account the impact of the loss of generation connected to applicable Transmission stations or Transmission substations. Additionally, the FERC order does not explicitly mention generation assets and is reasonably understood to focus on the most critical Transmission Facilities. The diagram below shows an example of a station.



Also, the SDT uses the phrase "Transmission stations or Transmission substations" to recognize the existence of both stations and substations. Many entities in industry consider a substation to be a location with physical borders (i.e. fence, wall, etc.) that contains at least an autotransformer. Locations also exist that do not contain autotransformers, and many entities in industry refer to those locations as stations (switching stations or switchyards). Therefore, the SDT chose to use both "station" and "substation" to refer to the locations where groups of Transmission Facilities exist.

On the issue of joint ownership, the SDT recognizes that this issue is not unique to CIP-014, and expects that the applicable Transmission Owners and Transmission Operators will develop memorandums of understanding, agreements, Coordinated Functional Registrations, or procedures, etc., to designate responsibilities under CIP-014 when joint ownership is at issue, which is similar to what many entities have completed for other Reliability Standards.

The language contained in the applicability section regarding the collector bus is directly copied from CIP-002-5.1, Attachment 1, and has no additional meaning within the CIP-014 standard.

Requirement R1

The initial risk assessment required under Requirement R1 must be completed on or before the effective date of the standard. Subsequent risk assessments are to be performed at least once every 30 or 60 months depending on the results of the previous risk assessment per Requirement R1, Part 1.1. In performing the risk assessment under Requirement R1, the Transmission Owner should first identify their population of Transmission stations and Transmission substations that meet the criteria contained in Applicability Section 4.1.1.

Requirement R1 then requires the Transmission Owner to perform a risk assessment, consisting of a transmission analysis, to determine which of those Transmission stations and Transmission Substations if rendered inoperable or damaged could result in instability, uncontrolled separation, or Cascading within an Interconnection. The requirement is not to require identification of, and thus, not intended to bring within the scope of the standard a Transmission station or Transmission substation unless the applicable Transmission Owner determines through technical studies and analyses based on objective analysis, technical expertise, operating experience and experienced judgment that the loss of such facility would have a critical impact on the operation of the Interconnection in the event the asset is rendered inoperable or damaged. In the November 20, 2014 Order, FERC reiterated that "only an instability that has a "critical impact on the operation of the interconnection" warrants finding that the facility causing the instability is critical under Requirement R1." The Transmission Owner may determine the criteria for critical impact by considering, among other criteria, any of the following:

- Criteria or methodology used by Transmission Planners or Planning Coordinators in TPL-001-4, Requirement R6
- NERC EOP-004-2 reporting criteria
- Area or magnitude of potential impact

The standard does not mandate the specific analytical method for performing the risk assessment. The Transmission Owner has the discretion to choose the specific method that best suites its needs. As an example, an entity may perform a Power Flow analysis and stability analysis at a variety of load levels.

Performing Risk Assessments

The Transmission Owner has the discretion to select a transmission analysis method that fits its facts and system circumstances. To mandate a specific approach is not technically desirable and may lead to results that fail to adequately consider regional, topological, and system circumstances. The following guidance is only an example on how a Transmission Owner may perform a power flow and/or stability analysis to identify those Transmission stations and Transmission substations that if rendered inoperable or damaged as a result of a physical attack could result in instability, uncontrolled separation, or Cascading within an Interconnection. An entity could remove all lines, without regard to the voltage level, to a single Transmission station or Transmission substation and review the simulation results to assess system behavior to determine if Cascading of Transmission Facilities, uncontrolled separation, or voltage or frequency instability is likely to occur over a significant area of the Interconnection. Using engineering judgment, the Transmission Owner (possibly in consultation with regional planning or operation committees and/or ISO/RTO committee input) should develop criteria (e.g. imposing a fault near the removed Transmission station or Transmission substation) to identify a contingency or parameters that result in potential instability, uncontrolled separation, or Cascading within an Interconnection. Regional consultation on these matters is likely to be helpful and informative, given that the inputs for the risk assessment and the attributes of what constitutes instability, uncontrolled separation, or Cascading within an Interconnection will

likely vary from region-to-region or from ISO-to-ISO based on topology, system characteristics, and system configurations. Criteria could also include post-contingency facilities loadings above a certain emergency rating or failure of a power flow case to converge. Available special protection systems (SPS), if any, could be applied to determine if the system experiences any additional instability which may result in uncontrolled separation. Example criteria may include:

(a) Thermal overloads beyond facility emergency ratings;

(b) Voltage deviation exceeding ± 10%; or

(c) Cascading outage/voltage collapse; or

(d) Frequency below under-frequency load shed points

Periodicity

A Transmission Owner who identifies one or more Transmission stations or Transmission substations (as verified under Requirement R2) that if rendered inoperable or damaged could result in instability, uncontrolled separation, or Cascading within an Interconnection is required to conduct a risk assessment at least once every 30 months. This period ensures that the risk assessment remains current with projected conditions and configurations in the planned system. This risk assessment, as the initial assessment, must consider applicable planned Transmission stations and Transmission substations to be in service within 24 months. The 30 month timeframe aligns with the 24 month planned to be in service date because the Transmission Owner is provided the flexibility, depending on its planning cycle and the frequency in which it may plan to construct a new Transmission station or Transmission substation to more closely align these dates. The requirement is to conduct the risk assessment at least once every 30 months, so for a Transmission Owner that believes it is better to conduct a risk assessment once every 24 months, because of its planning cycle, it has the flexibility to do so.

Transmission Owners that have not identified any Transmission stations or Transmission substations (as verified under Requirement R2) that if rendered inoperable or damaged could result in instability, uncontrolled separation, or Cascading within an Interconnection are unlikely to see changes to their risk assessment in the Near-Term Planning Horizon. Consequently, a 60 month periodicity for completing a subsequent risk assessment is specified.

Identification of Primary Control Centers

After completing the risk assessment specified in Requirement R1, it is important to additionally identify the primary control center that operationally controls each Transmission station or Transmission substation that if rendered inoperable or damaged could result in instability, uncontrolled separation, or Cascading within an Interconnection. A primary control center "operationally controls" a Transmission station or Transmission substation when the control center's electronic actions can cause direct physical actions at the identified Transmission station and Transmission substation, such as opening a breaker.

Requirement R2

This requirement specifies verification of the risk assessment performed under Requirement R1 by an entity other than the owner or operator of the Requirement R1 risk assessment.

A verification of the risk assessment by an unaffiliated third party, as specified in Requirement R2, could consist of:

1. Certifying that the Requirement R1 risk assessment considers the Transmission stations and Transmission substations identified in Applicability Section 4.1.1.
2. Review of the model used to conduct the risk assessment to ensure it contains sufficient system topology to identify Transmission stations and Transmission substations that if rendered inoperable or damaged could cause instability, uncontrolled separation, or Cascading within an Interconnection.
3. Review of the Requirement R1 risk assessment methodology.

This requirement provides the flexibility for a Transmission Owner to select from unaffiliated registered and non-registered entities with transmission planning or analysis experience to perform the verification of the Requirement R1 risk assessment. The term unaffiliated means that the selected verifying entity cannot be a corporate affiliate (*i.e.,* the verifying or third party reviewer cannot be an entity that corporately controls, is controlled by or is under common control with, the Transmission Owner). The verifying entity also cannot be a division of the Transmission Owner that operates as a functional unit.

The prohibition on registered entities using a corporate affiliate to conduct the verification, however, does not prohibit a governmental entity (e.g., a city, a municipality, a U.S. federal power marketing agency, or any other political subdivision of U.S. or Canadian federal, state, or provincial governments) from selecting as the verifying entity another governmental entity within the same political subdivision. For instance, a U.S. federal power marketing agency may select as its verifier another U.S. federal agency to conduct its verification so long as the selected entity has transmission planning or analysis experience. Similarly, a Transmission Owner owned by a Canadian province can use a separate agency of that province to perform the verification. The verifying entity, however, must still be a third party and cannot be a division of the registered entity that operates as a functional unit.

Requirement R2 also provides that the "verification may occur concurrent with or after the risk assessment performed under Requirement R1." This provision is designed to provide the Transmission Owner the flexibility to work with the verifying entity throughout (*i.e.,* concurrent with) the risk assessment, which for some Transmission Owners may be more efficient and effective. In other words, a Transmission Owner could collaborate with their unaffiliated verifying entity to perform the risk assessment under Requirement R1 such that both Requirement R1 and Requirement R2 are satisfied concurrently. The intent of Requirement R2 is to have an entity other than the owner or operator of the facility to be involved in the risk assessment process and have an opportunity to provide input. Accordingly, Requirement R2 is designed to allow entities the discretion to have a two-step process, where the Transmission Owner performs the risk assessment and subsequently has a third-party review that

assessment, or a one-step process, where the entity collaborates with a third party to perform the risk assessment.

Characteristics to consider in selecting a third party reviewer could include:

- Registered Entity with applicable planning and reliability functions.
- Experience in power system studies and planning.
- The entity's understanding of the MOD standards, TPL standards, and facility ratings as they pertain to planning studies.
- The entity's familiarity with the Interconnection within which the Transmission Owner is located.

With respect to the requirement that Transmission owners develop and implement procedures for protecting confidential and sensitive information, the Transmission Owner could have a method for identifying documents that require confidential treatment. One mechanism for protecting confidential or sensitive information is to prohibit removal of sensitive or confidential information from the Transmission Owner's site. Transmission Owners could include such a prohibition in a non-disclosure agreement with the verifying entity.

A Technical feasibility study is not required in the Requirement R2 documentation of the technical basis for not modifying the identification in accordance with the recommendation.

On the issue of the difference between a verifier in Requirement R2 and a reviewer in Requirement R6, the SDT indicates that the verifier will confirm that the risk assessment was completed in accordance with Requirement R1, including the number of Transmission stations and substations identified, while the reviewer in Requirement R6 is providing expertise on the manner in which the evaluation of threats was conducted in accordance with Requirement R4, and the physical security plan in accordance with Requirement R5. In the latter situation there is no verification of a technical analysis, rather an application of experience and expertise to provide guidance or recommendations, if needed.

Parts 2.4 and 6.4 require the entities to have procedures to protect the confidentiality of sensitive or confidential information. Those procedures may include the following elements:

1. Control and retention of information on site for third party verifiers/reviewers.
2. Only "need to know" employees, etc., get the information.
3. Marking documents as confidential
4. Securely storing and destroying information when no longer needed.
5. Not releasing information outside the entity without, for example, General Counsel sign-off.

Requirement R3

Some Transmission Operators will have obligations under this standard for certain primary control centers. Those obligations, however, are contingent upon a Transmission Owner first completing the risk assessment specified by Requirement R1 and the verification specified by

Requirement R2. Requirement R3 is intended to ensure that a Transmission Operator that has operational control of a primary control center identified in Requirement R1 receive notice so that the Transmission Operator may fulfill the rest of the obligations required in Requirements R4 through R6. Since the timing obligations in Requirements R4 through R6 are based upon completion of Requirement R2, the Transmission Owner must also include within the notice the date of completion of Requirement R2. Similarly, the Transmission Owner must notify the Transmission Operator of any removals from identification that result from a subsequent risk assessment under Requirement R1 or as a result of the verification process under Requirement R2.

Requirement R4

This requirement requires owners and operators of facilities identified by the Requirement R1 risk assessment and that are verified under Requirement R2 to conduct an assessment of potential threats and vulnerabilities to those Transmission stations, Transmission substations, and primary control centers using a tailored evaluation process. Threats and vulnerabilities may vary from facility to facility based on any number of factors that include, but are not limited to, location, size, function, existing physical security protections, and attractiveness as a target.

In order to effectively conduct a threat and vulnerability assessment, the asset owner may be the best source to determine specific site vulnerabilities, but current and evolving threats may best be determined by others in the intelligence or law enforcement communities. A number of resources have been identified in the standard, but many others exist and asset owners are not limited to where they may turn for assistance. Additional resources may include state or local fusion centers, U.S. Department of Homeland Security, Federal Bureau of Investigations (FBI), Public Safety Canada, Royal Canadian Mounted Police, and InfraGard chapters coordinated by the FBI.

The Responsible Entity is required to take a number of factors into account in Parts 4.1 to 4.3 in order to make a risk-based evaluation under Requirement R4.

To assist in determining the current threat for a facility, the prior history of attacks on similarly protected facilities should be considered when assessing probability and likelihood of occurrence at the facility in question.

Resources that may be useful in conducting threat and vulnerability assessments include:

- NERC Security Guideline for the Electricity Sector: Physical Security.
- NERC Security Guideline: Physical Security Response.
- ASIS International General Risk Assessment Guidelines.
- ASIS International Facilities Physical Security Measure Guideline.
- ASIS International Security Management Standard: Physical Asset Protection.
- Whole Building Design Guide - Threat/Vulnerability Assessments.

Requirement R5

This requirement specifies development and implementation of a security plan(s) designed to protect against attacks to the facilities identified in Requirement R1 based on the assessment performed under Requirement R4.

Requirement R5 specifies the following attributes for the physical security plan:

- *Resiliency or security measures designed collectively to deter, detect, delay, assess, communicate, and respond to potential physical threats and vulnerabilities identified during the evaluation conducted in Requirement R4.*

  Resiliency may include, among other things:

  a. System topology changes,

  b. Spare equipment,

  c. Construction of a new Transmission station or Transmission substation.

  While most security measures will work together to collectively harden the entire site, some may be allocated to protect specific critical components. For example, if protection from gunfire is considered necessary, the entity may only install ballistic protection for critical components, not the entire site.

- *Law enforcement contact and coordination information.*

  Examples of such information may be posting 9-1-1 for emergency calls and providing substation safety and familiarization training for local and federal law enforcement, fire department, and Emergency Medical Services.

- *A timeline for executing the physical security enhancements and modifications specified in the physical security plan.*

  Entities have the flexibility to prioritize the implementation of the various resiliency or security enhancements and modifications in their security plan according to risk, resources, or other factors. The requirement to include a timeline in the physical security plan for executing the actual physical security enhancements and modifications does not also require that the enhancements and modifications be completed within 120 days. The actual timeline may extend beyond the 120 days, depending on the amount of work to be completed.

- *Provisions to evaluate evolving physical threats, and their corresponding security measures, to the*Applicable Transmission station(s), or Transmission substation(s)*, or primary control center(s).* are those that meet any of the following criteria:

1. Transmission Facilities operated at 500 kV or higher. For the purpose of this criterion, the collector bus for a generation plant is not considered a Transmission Facility, but is part of the generation interconnection Facility.

2. Transmission Facilities that are operating between 200 kV and 499 kV at a single station or substation, where the station or substation is connected at 200 kV or higher voltages to three or more other Transmission stations or substations and has an "aggregate weighted

value" exceeding 3000 according to the table below. The "aggregate weighted value" for a single station or substation is determined by summing the "weight value per line" shown in the table below for each incoming and each outgoing BES Transmission Line that is connected to another Transmission station or substation. For the purpose of this criterion, the collector bus for a generation plant is not considered a Transmission Facility, but is part of the generation interconnection Facility.

A registered entity's physical security plan should include processes and responsibilities for obtaining and handling alerts, intelligence, and threat warnings from various sources. Some of these sources could include the ERO, ES-ISAC, and US and/or Canadian federal agencies. This information should be used to reevaluate or consider changes in the security plan and corresponding security measures of the security plan found in R5.

Incremental changes made to the physical security plan prior to the next required third party review do not require additional third party reviews.

Voltage Value of a Line	**Weight Value per Line**
less than 200 kV (not applicable)	(not applicable)
200 kV to 299 kV	700
300 kV to 499 kV	1300
500 kV and above	N/A

Requirement R6

This requirement specifies review by an entity other than the Transmission Owner or Transmission Operator with appropriate expertise for the evaluation performed according to Requirement R4 and the security plan(s) developed according to Requirement R5. As with Requirement R2, the term unaffiliated means that the selected third party reviewer cannot be a corporate affiliate (*i.e.*, the third party reviewer cannot be an entity that corporately controls, is controlled by or is under common control with, the Transmission Operator). A third party reviewer also cannot be a division of the Transmission Operator that operates as a functional unit.

As noted in the guidance for Requirement R2, the prohibition on registered entities using a corporate affiliate to conduct the review, however, does not prohibit a governmental entity from selecting as the third party reviewer another governmental entity within the same political subdivision. For instance, a city or municipality may use its local enforcement agency, so long as the local law enforcement agency satisfies the criteria in Requirement R6. The third party reviewer, however, must still be a third party and cannot be a division of the registered entity that operates as a functional unit.

The Responsible Entity can select from several possible entities to perform the review:

- *An entity or organization with electric industry physical security experience and whose review staff has at least one member who holds either a Certified Protection Professional (CPP) or Physical Security Professional (PSP) certification.*

  In selecting CPP and PSP for use in this standard, the SDT believed it was important that if a private entity such as a consulting or security firm was engaged to conduct the third-party review, they must tangibly demonstrate competence to conduct the review. This includes electric industry physical security experience and either of the premier security industry certifications sponsored by ASIS International. The ASIS certification program was initiated in 1977, and those that hold the CPP certification are board certified in security management. Those that hold the PSP certification are board certified in physical security.

- *An entity or organization approved by the ERO.*

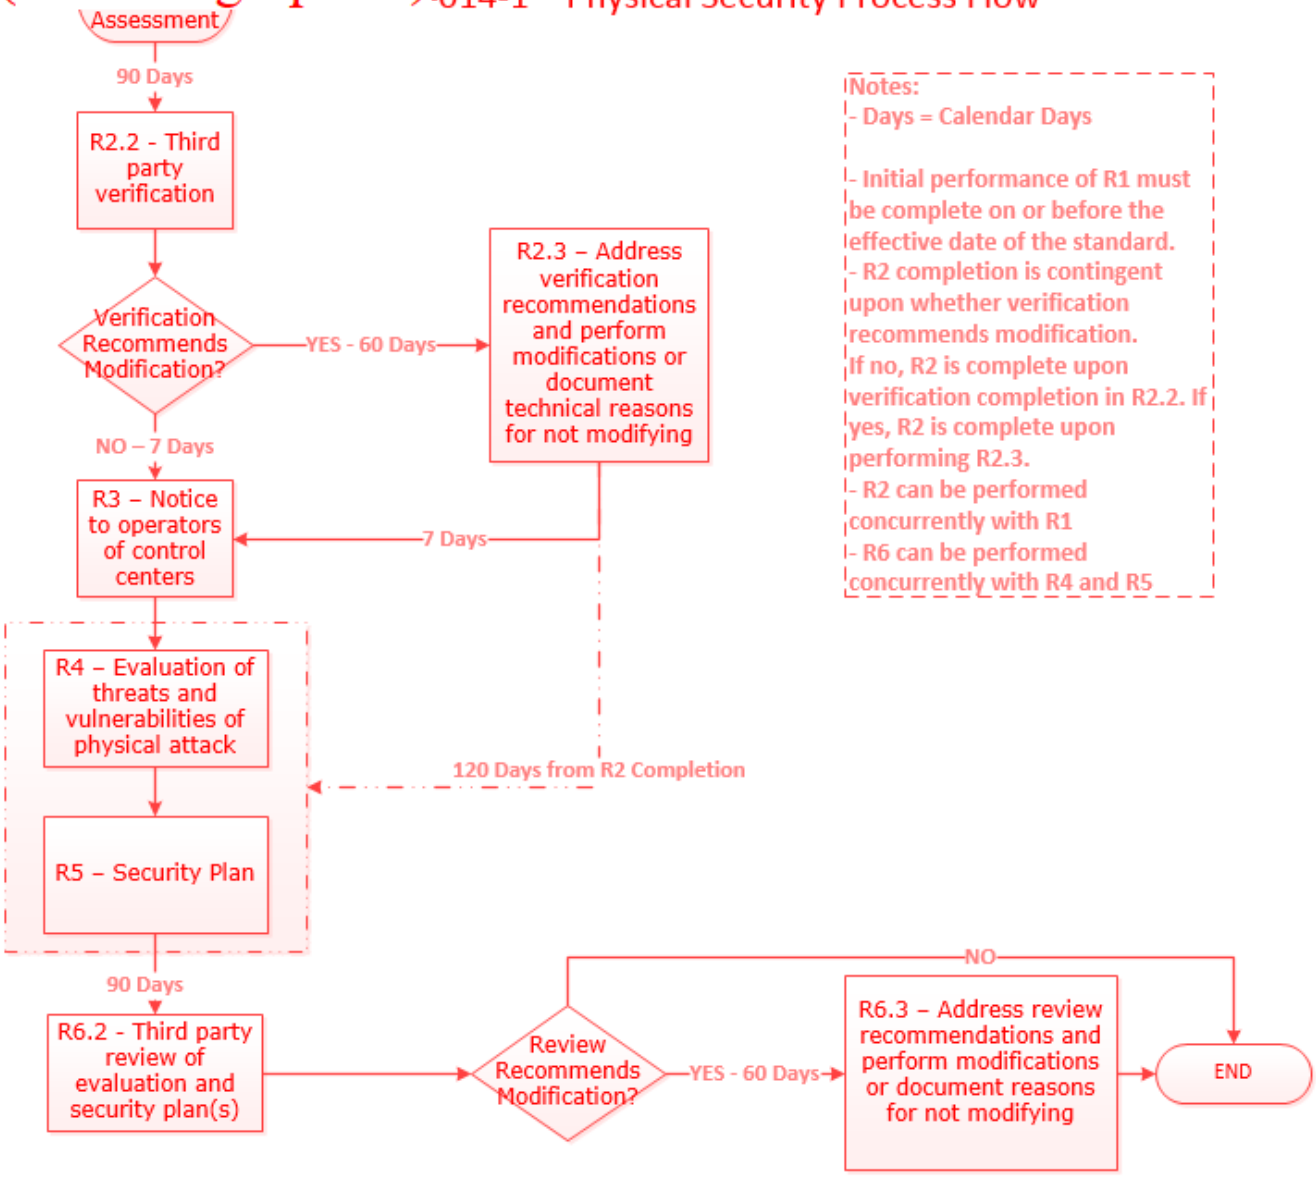
- *A governmental agency with physical security expertise.*

- *An entity or organization with demonstrated law enforcement, government, or military physical security expertise.*

As with the verification under Requirement R2, Requirement R6 provides that the "review may occur concurrently with or after completion of the evaluation performed under Requirement R4 and the security plan development under Requirement R5." This provision is designed to provide applicable Transmission Owners and Transmission Operators the flexibility to work with the third-party reviewer throughout (*i.e.*, concurrent with) the evaluation performed according to Requirement R4 and the security plan(s) developed according to Requirement R5, which for some Responsible Entities may be more efficient and effective. In other words, a Transmission Owner or Transmission Operator could collaborate with their unaffiliated third-party reviewer to perform an evaluation of potential threats and vulnerabilities (Requirement R4) and develop a security plan (Requirement R5) to satisfy Requirements R4 through R6 simultaneously. The intent of Requirement R6 is to have an entity other than the owner or operator of the facility to be involved in the Requirement R4 evaluation and the development of the Requirement R5 security plans and have an opportunity to provide input on the evaluation and the security plan. Accordingly, Requirement R6 is designed to allow entities the discretion to have a two-step process, where the Transmission Owner performs the evaluation and develops the security plan itself and then has a third-party review that assessment, or a one-step process, where the entity collaborates with a third party to perform the evaluation and develop the security plan.

~~Timeline~~

(Deleted graphics)-014-1 – Physical Security Process Flow



Rationale

During development of this standard, text boxes were embedded within the standard to explain the rationale for various parts of the standard. Upon BOT approval, the text from the rationale text boxes was moved to this section.

Rationale for Requirement R1:
This requirement meets the FERC directive from paragraph 6 of its March 7, 2014 order on physical security to perform a risk assessment to identify which facilities if rendered inoperable or damaged could impact an Interconnection through instability, uncontrolled separation, or cascading failures. The requirement is not intended to bring within the scope of the standard a Transmission station or Transmission substation unless the applicable Transmission Owner determines through technical studies and analyses based on objective analysis, technical expertise, operating experience and experienced judgment that the loss of such facility would have a critical impact on the operation of the Interconnection in the event the asset is rendered inoperable or damaged. In the November 20, 2014 Order, FERC reiterated that "only an instability that has a "critical impact on the operation of the interconnection" warrants finding that the facility causing the instability is critical under Requirement R1." The Transmission Owner may determine the criteria for critical impact by considering, among other criteria, any of the following:

- Criteria or methodology used by Transmission Planners or Planning Coordinators in TPL-001-4, Requirement R6
- NERC EOP-004-2 reporting criteria
- Area or magnitude of potential impact

Requirement R1 also meets the FERC directive for periodic reevaluation of the risk assessment by requiring the risk assessment to be performed every 30 months (or 60 months for an entity that has not identified in a previous risk assessment any Transmission stations or Transmission substations that if rendered inoperable or damaged could result in instability, uncontrolled separation, or Cascading within an Interconnection).

After identifying each Transmission station and Transmission substation that meets the criteria in Requirement R1, it is important to additionally identify the primary control center that operationally controls that Transmission station or Transmission substation (*i.e.*, the control center whose electronic actions can cause direct physical actions at the identified Transmission station and Transmission substation, such as opening a breaker, compared to a control center that only has the ability to monitor the Transmission station and Transmission substation and, therefore, must coordinate direct physical action through another entity).

Rationale for Requirement R2:
This requirement meets the FERC directive from paragraph 11 in the order on physical security

requiring verification by an entity other than the owner or operator of the risk assessment performed under Requirement R1.

This requirement provides the flexibility for a Transmission Owner to select registered and non-registered entities with transmission planning or analysis experience to perform the verification of the Requirement R1 risk assessment. The term "unaffiliated" means that the selected verifying entity cannot be a corporate affiliate (*i.e.*, the verifying entity cannot be an entity that controls, is controlled by, or is under common control with, the Transmission owner). The verifying entity also cannot be a division of the Transmission Owner that operates as a functional unit. The term "unaffiliated" is not intended to prohibit a governmental entity from using another government entity to be a verifier under Requirement R2.

Requirement R2 also provides the Transmission Owner the flexibility to work with the verifying entity throughout the Requirement R1 risk assessment, which for some Transmission Owners may be more efficient and effective. In other words, a Transmission Owner could coordinate with their unaffiliated verifying entity to perform a Requirement R1 risk assessment to satisfy both Requirement R1 and Requirement R2 concurrently.

Planning Coordinator is a functional entity listed in Part 2.1. The Planning Coordinator and Planning Authority are the same entity as shown in the NERC Glossary of Terms Used in NERC Reliability Standards.

Rationale for Requirement R3:
Some Transmission Operators will have obligations under this standard for certain primary control centers. Those obligations, however, are contingent upon a Transmission Owner first identifying which Transmission stations and Transmission substations meet the criteria specified by Requirement R1, as verified according to Requirement R2. This requirement is intended to ensure that a Transmission Operator that has operational control of a primary control center identified in Requirement R1, Part 1.2 of a Transmission station or Transmission substation verified according to Requirement R2 receives notice of such identification so that the Transmission Operator may timely fulfill its resulting obligations under Requirements R4 through R6. Since the timing obligations in Requirements R4 through R6 are based upon completion of Requirement R2, the Transmission Owner must also include notice of the date of completion of Requirement R2. Similarly, the Transmission Owner must notify the Transmission Operator of any removals from identification that result from a subsequent risk assessment under Requirement R1 or the verification process under Requirement R2.

Rationale for Requirement R4:
This requirement meets the FERC directive from paragraph 8 in the order on physical security that the reliability standard must require tailored evaluation of potential threats and vulnerabilities to facilities identified in Requirement R1 and verified according to Requirement R2. Threats and vulnerabilities may vary from facility to facility based on factors such as the facility's location, size, function, existing protections, and attractiveness of the target. As such,

the requirement does not mandate a one-size-fits-all approach but requires entities to account for the unique characteristics of their facilities.

Requirement R4 does not explicitly state when the evaluation of threats and vulnerabilities must occur or be completed. However, Requirement R5 requires that the entity's security plan(s), which is dependent on the Requirement R4 evaluation, must be completed within 120 calendar days following completion of Requirement R2. Thus, an entity has the flexibility when to complete the Requirement R4 evaluation, provided that it is completed in time to comply with the requirement in Requirement R5 to develop a physical security plan 120 calendar days following completion of Requirement R2.

Rationale for Requirement R5:
This requirement meets the FERC directive from paragraph 9 in the order on physical security requiring the development and implementation of a security plan(s) designed to protect against attacks to the facilities identified in Requirement R1 based on the assessment performed under Requirement R4.

Rationale for Requirement R6:
This requirement meets the FERC directive from paragraph 11 in the order on physical security requiring review by an entity other than the owner or operator with appropriate expertise of the evaluation performed according to Requirement R4 and the security plan(s) developed according to Requirement R5.

As with the verification required by Requirement R2, Requirement R6 provides Transmission Owners and Transmission Operators the flexibility to work with the third party reviewer throughout the Requirement R4 evaluation and the development of the Requirement R5 security plan(s). This would allow entities to satisfy their obligations under Requirement R6 concurrent with the satisfaction of their obligations under Requirements R4 and R5.

3. Transmission Facilities at a single station or substation location that are identified by its Reliability Coordinator, Planning Coordinator, or Transmission Planner as critical to the derivation of Interconnection Reliability Operating Limits (IROLs) and their associated contingencies.

4. Transmission Facilities identified as essential to meeting Nuclear Plant Interface Requirements (NPIRs).

Attachment 1 – Applicability Criteria

Applicable Transmission station(s) or Transmission substation(s) are those that meet any of the following criteria:

1. Transmission Facilities operated at 500 kV or higher. For the purpose of this criterion, the collector bus for a generation plant is not considered a Transmission Facility, but is part of the generation interconnection Facility.

2. Transmission Facilities that are operating between 200 kV and 499 kV at a single station or substation, where the station or substation is connected at 200 kV or higher voltages to three or more other Transmission stations or substations and has an "aggregate weighted value" exceeding 3000 according to the table below. The "aggregate weighted value" for a single station or substation is determined by summing the "weight value per line" shown in the table below for each incoming and each outgoing BES Transmission Line that is connected to another Transmission station or substation. For the purpose of this criterion, the collector bus for a generation plant is not considered a Transmission Facility, but is part of the generation interconnection Facility.

Voltage Value of a Line	Weight Value per Line
less than 200 kV (not applicable)	(not applicable)
200 kV to 299 kV	700
300 kV to 499 kV	1300
500 kV and above	N/A

3. Transmission Facilities at a single station or substation location that are identified by its Reliability Coordinator, Planning Coordinator, or Transmission Planner as critical to the derivation of Interconnection Reliability Operating Limits (IROLs) and their associated contingencies.

4. Transmission Facilities identified as essential to meeting Nuclear Plant Interface Requirements (NPIRs).

NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

Implementation Plan

Project 2023-06 CIP-014 Risk Assessment Refinement
Reliability Standard CIP-014-4

Applicable Standard(s)

- CIP-014-4 Physical Security

Requested Retirement(s)

- CIP-014-3 Physical Security

Applicable Entities

- Transmission Owner (TO)
- Transmission Operator (TOP)

General Considerations

The Drafting Team has determined that 24 calendar months for the CIP-014-4 implementation plan would allow adequate time for Transmission Owners and Transmission Operators to determine applicability, develop criteria, write or revise methodologies, perform assessments, and procure unaffiliated third parties for risk assessment verification (which some Transmission Owners have performed concurrently with their risk assessment analyses).

Effective Date of CIP-014-4

Where approval by an Applicable Governmental Authority is required, Reliability Standard CIP-014-4 shall become effective on the first day of the first calendar quarter that is 24 calendar months after the effective date of the Applicable Governmental Authority's order approving the standard or as otherwise provided for by the Applicable Governmental Authority.

Where approval by an Applicable Governmental Authority is not required, Reliability Standard CIP-014-4 shall become effective on the first day of the first calendar quarter that is 24 calendar months after the date the standard is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.

Initial Performance of Periodic Requirements

The initial risk assessment required by Reliability Standard CIP-014-4 Requirement R5, must be completed on or before the effective date of the standard. Subsequent risk assessments shall be performed no later than 36 calendar months following the effective date of Reliability Standard CIP-014-4.

Retirement Date

Reliability Standard CIP-014-3 shall be retired immediately prior to the effective date of Reliability Standard CIP-014 in the particular jurisdiction in which the revised standard is becoming effective.

Violation Risk Factor and Violation Severity Level Justifications

Project 2023-06 CIP-014 Risk Assessment Refinement (CIP-014-4)

This document provides the drafting team's (DT's) justification for assignment of violation risk factors (VRFs) and violation severity levels (VSLs) for each requirement in CIP-014-4 Physical Security. Each requirement is assigned a VRF and a VSL. These elements support the determination of an initial value range for the Base Penalty Amount regarding violations of requirements in FERC-approved Reliability Standards, as defined in the Electric Reliability Organizations (ERO) Sanction Guidelines. The SDT applied the following NERC criteria and FERC Guidelines when developing the VRFs and VSLs for the requirements.

NERC Criteria for Violation Risk Factors

High Risk Requirement

A requirement that, if violated, could directly cause or contribute to Bulk Electric System instability, separation, or a cascading sequence of failures, or could place the Bulk Electric System at an unacceptable risk of instability, separation, or cascading failures; or, a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly cause or contribute to Bulk Electric System instability, separation, or a cascading sequence of failures, or could place the Bulk Electric System at an unacceptable risk of instability, separation, or cascading failures, or could hinder restoration to a normal condition.

Medium Risk Requirement

A requirement that, if violated, could directly affect the electrical state or the capability of the Bulk Electric System, or the ability to effectively monitor and control the Bulk Electric System. However, violation of a medium risk requirement is unlikely to lead to Bulk Electric System instability, separation, or cascading failures; or, a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or capability of the Bulk Electric System, or the ability to effectively monitor, control, or restore the Bulk Electric System. However, violation of a medium risk requirement is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to Bulk Electric System instability, separation, or cascading failures, nor to hinder restoration to a normal condition.

Lower Risk Requirement
A requirement that is administrative in nature and a requirement that, if violated, would not be expected to adversely affect the electrical state or capability of the Bulk Electric System, or the ability to effectively monitor and control the Bulk Electric System; or, a requirement that is administrative in nature and a requirement in a planning time frame that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to adversely affect the electrical state or capability of the Bulk Electric System, or the ability to effectively monitor, control, or restore the Bulk Electric System.

FERC Guidelines for Violation Risk Factors

Guideline (1) – Consistency with the Conclusions of the Final Blackout Report

FERC seeks to ensure that VRFs assigned to Requirements of Reliability Standards in these identified areas appropriately reflect their historical critical impact on the reliability of the Bulk-Power System. In the VSL Order, FERC listed critical areas (from the Final Blackout Report) where violations could severely affect the reliability of the Bulk-Power System:

- Emergency operations
- Vegetation management
- Operator personnel training
- Protection systems and their coordination
- Operating tools and backup facilities
- Reactive power and voltage control
- System modeling and data exchange
- Communication protocol and facilities
- Requirements to determine equipment ratings
- Synchronized data recorders
- Clearer criteria for operationally critical facilities
- Appropriate use of transmission loading relief.

Guideline (2) – Consistency within a Reliability Standard
FERC expects a rational connection between the sub-Requirement VRF assignments and the main Requirement VRF assignment.

Guideline (3) – Consistency among Reliability Standards
FERC expects the assignment of VRFs corresponding to Requirements that address similar reliability goals in different Reliability Standards would be treated comparably.

Guideline (4) – Consistency with NERC's Definition of the Violation Risk Factor Level
Guideline (4) was developed to evaluate whether the assignment of a particular VRF level conforms to NERC's definition of that risk level.

Guideline (5) – Treatment of Requirements that Co-mingle More Than One Obligation
Where a single Requirement co-mingles a higher risk reliability objective and a lesser risk reliability objective, the VRF assignment for such Requirements must not be watered down to reflect the lower risk level associated with the less important objective of the Reliability Standard.

NERC Criteria for Violation Severity Levels

VSLs define the degree to which compliance with a requirement was not achieved. Each requirement must have at least one VSL. While it is preferable to have four VSLs for each requirement, some requirements do not have multiple "degrees" of noncompliant performance and may have only one, two, or three VSLs.

VSLs should be based on NERC's overarching criteria shown in the table below:

Lower VSL	Moderate VSL	High VSL	Severe VSL
The performance or product measured almost meets the full intent of the requirement.	The performance or product measured meets the majority of the intent of the requirement.	The performance or product measured does not meet the majority of the intent of the requirement, but does meet some of the intent.	The performance or product measured does not substantively meet the intent of the requirement.

FERC Order of Violation Severity Levels

The FERC VSL guidelines are presented below, followed by an analysis of whether the VSLs proposed for each requirement in the standard meet the FERC Guidelines for assessing VSLs:

Guideline (1) – Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance

Compare the VSLs to any prior levels of non-compliance and avoid significant changes that may encourage a lower level of compliance than was required when levels of non-compliance were used.

Guideline (2) – Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties

A violation of a "binary" type requirement must be a "Severe" VSL.
Do not use ambiguous terms such as "minor" and "significant" to describe noncompliant performance.

Guideline (3) – Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement

VSLs should not expand on what is required in the requirement.

Guideline (4) – Violation Severity Level Assignment Should Be Based on a Single Violation, Not on a Cumulative Number of Violations

Unless otherwise stated in the requirement, each instance of non-compliance with a requirement is a separate violation. Section 4 of the Sanction Guidelines states that assessing penalties on a per violation per day basis is the "default" for penalty calculations.

VRF Justifications for CIP-014-4, Requirement R1	
Proposed VRF	**High**
NERC VRF Discussion	A VRF of higher is appropriate because the requirement, if violated, could directly cause or contribute to Bulk Electric System instability, separation, or a cascading sequence of failures, or could place the Bulk Electric System at an unacceptable risk of instability, separation, or cascading failures. The VRF is revised and unchanged from the last FERC approved version.
FERC VRF G1 Discussion Guideline 1- Consistency with Blackout Report	This VRF is consistent with the identified areas from the FERC list of critical areas in the Final Blackout Report.
FERC VRF G2 Discussion Guideline 2- Consistency within a Reliability Standard	The VRF for Requirement R1 is consistent with those connections between the sub-Requirement VRF assignments and the main Requirement VRF assignment.
FERC VRF G3 Discussion Guideline 3- Consistency among Reliability Standards	This VRF is consistent with other VRFs that address similar reliability goals in different Reliability Standards.
FERC VRF G4 Discussion Guideline 4- Consistency with NERC Definitions of VRFs	This VRF is consistent with the definition of a High VRF requirement per the criteria filed with FERC as part of the ERO's Sanctions Guidelines.
FERC VRF G5 Discussion Guideline 5- Treatment of Requirements that Co-mingle More	This requirement does not mingle a higher risk reliability objective and a lesser risk reliability objective. Therefore, the VRF reflects the risk of the whole requirement.

VRF Justifications for CIP-014-4, Requirement R1	
Proposed VRF	**High**
than One Obligation	

VSLs for CIP-014-4, Requirement R1			
Lower	**Moderate**	**High**	**Severe**
The Transmission Owner identified each applicable Transmission station(s) or Transmission substation(s) per Attachment 1, but did so after 36 calendar months, but less than or equal to 38 calendar months. OR The Transmission Owner identified each applicable Transmission station(s) or Transmission substation(s), but failed to identify less than or equal to 10% of the applicable Transmission station(s) or Transmission substation(s) per Attachment 1.	The Transmission Owner identified each applicable Transmission station(s) or Transmission substation(s) per Attachment 1, but did so after 38 calendar months, but less than or equal to 40 calendar months. OR The Transmission Owner identified each applicable Transmission station(s) or Transmission substation(s), but failed to identify more than 10% and less than or equal to 20% of the applicable Transmission station(s) or Transmission substation(s) per Attachment 1.	The Transmission Owner identified each applicable Transmission station(s) or Transmission substation(s) per Attachment 1, but did so after 40 calendar months, but less than or equal to 42 calendar months. OR The Transmission Owner identified each applicable Transmission station(s) or Transmission substation(s), but failed to identify more than 20% and less than or equal to 30% of the applicable Transmission station(s) or Transmission substation(s) per Attachment 1.	The Transmission Owner failed to identify each applicable Transmission station(s) or Transmission substation(s) per Attachment 1. OR The Transmission Owner identified each applicable Transmission station(s) or Transmission substation(s) per Attachment 1, but did so after more than 42 calendar months. OR The Transmission Owner identified each applicable Transmission station(s) or Transmission substation(s), but failed to identify more than 30% of the applicable Transmission station(s) or Transmission substation(s) per Attachment 1.

VSL Justifications for CIP-014-4, Requirement R1	
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	The proposed VSLs do not have the unintended consequence of lowering the level of compliance.
FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	The proposed VSLs are not binary and do not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.
FERC VSL G3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	The proposed VSLs use the same terminology as used in the associated requirement and are, therefore, consistent with the requirement.
FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	Each VSL is based on a single violation and not cumulative violations.

VRF Justifications for CIP-014-4, Requirement R2	
Proposed VRF	**Medium**
NERC VRF Discussion	A VRF of Medium is appropriate because, if violated, it could directly affect the electrical state or the capability of the Bulk Electric System, or the ability to effectively monitor and control the Bulk Electric System; however, a violation is unlikely to lead to Bulk Electric System instability, separation, or cascading failures.
FERC VRF G1 Discussion Guideline 1- Consistency with Blackout Report	This VRF is consistent with the identified areas from the FERC list of critical areas in the Final Blackout Report.
FERC VRF G2 Discussion Guideline 2- Consistency within a Reliability Standard	The VRF for Requirement R2 is consistent with those connections between the sub-Requirement VRF assignments and the main Requirement VRF assignment.
FERC VRF G3 Discussion Guideline 3- Consistency among Reliability Standards	This VRF is consistent with other VRFs that address similar reliability goals in different Reliability Standards.
FERC VRF G4 Discussion Guideline 4- Consistency with NERC Definitions of VRFs	This VRF is consistent with the definition of a Medium VRF requirement per the criteria filed with FERC as part of the ERO's Sanctions Guidelines.
FERC VRF G5 Discussion Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation	This requirement does not mingle a higher risk reliability objective and a lesser risk reliability objective. Therefore, the VRF reflects the risk of the whole requirement.

VSLs for CIP-014-4, Requirement R2			
Lower	**Moderate**	**High**	**Severe**
N/A	N/A	N/A	The Transmission Owner did not identify proximate Transmission station(s) and Transmission substation(s), irrespective of ownership, within 1500 feet or 457 meters (the shortest distance, measured substation fence line to substation fence line) of an applicable Transmission station or Transmission substation identified in Requirement R1.

VSL Justifications for CIP-014-4, Requirement R2	
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	This is a new Requirement and does not have the unintended consequence of lowering the current level of compliance.
FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not	The proposed VSLs are binary and do not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations. The new Requirement R2 is a binary requirement and thus only assigned a Severe VSL because the Transmission Owners either have or have not identified proximate Transmission station(s) and Transmission substation(s), irrespective of ownership, within 1500 feet or 457 meters (the shortest distance, measured substation fence line to substation fence line) of an applicable Transmission station or Transmission substation identified in Requirement R1.

VSL Justifications for CIP-014-4, Requirement R2	
Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	
FERC VSL G3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	The proposed VSLs use the same terminology as used in the associated requirement and are, therefore, consistent with the requirement.
FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	Each VSL is based on a single violation and not cumulative violations.

VRF Justifications for CIP-014-4, Requirement R3	
Proposed VRF	**High**

VSL Justifications for CIP-014-4, Requirement R10	
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	This is an existing Requirement. The drafting team revised the VSL language for consistency with the proposed revisions to the standard. All of the violation severity levels stayed the same from the previously FERC-approved version

FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	The proposed VSLs are not binary and do not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.
FERC VSL G3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	The proposed VSLs use the same terminology as used in the associated requirement and are, therefore, consistent with the requirement.
FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	Each VSL is based on a single violation and not cumulative violations.

NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

Technical Rationale

Project 2023-06 CIP-014 Risk Assessment Refinement
Reliability Standard CIP-014-4 | June 2025

CIP-014-4 – Physical Security

In performing the risk assessment, the Transmission Owner should first identify their population of Transmission stations and Transmission substations that meet the criteria contained in Attachment 1. The Standard requires the Transmission Owner to perform a risk assessment, consisting of transmission analyses to determine which of those Transmission stations and Transmission Substations, if rendered inoperable or damaged, could result in instability, uncontrolled separation, or Cascading within an Interconnection.

The purpose of Reliability Standard CIP-014 is to protect Transmission stations and Transmission substations, and their associated primary control centers, that if rendered inoperable or damaged, as a result of a physical attack, could result in instability, uncontrolled separation, or Cascading within an Interconnection. To properly identify candidates for such Transmission station(s) and Transmission substation(s), the Transmission Owner shall evaluate the criteria listed in Attachment 1.

Rationale for Requirement R1
In the previous version of CIP-014, the 30-month time frame and the 24-month planned-to-be-in-service date could, if not carefully applied, lead to gaps between models and study horizons. Per the Standard Authorization Request (SAR), CIP-014-4 has consolidated these multiple timelines into one.

Requirement R1 is revised to ensure that each Transmission Owner establishes a list of applicable Transmission station(s) or Transmission substation(s) in accordance with Attachment 1. Aligning the 36 calendar months look ahead in Requirement R1 with the 36 calendar month risk assessment cycle ensures that system topology of the cases used to assess applicability is consistent with the system topology in the risk assessment models.

Transmission Owners shall review and, if necessary, update the list of applicable Transmission station(s) or Transmission substation(s) per Attachment 1 at least once every 36 calendar months. The list of applicable Transmission station(s) or Transmission substation(s) shall include existing or planned to be in service within 36 calendar months Transmission station(s) and Transmission substation(s). The 36 calendar months cycle for updating the list of applicable Transmission station(s) or Transmission substation(s) per Attachment 1 aligns with the annual cycle for performing Planning Assessments per NERC Standard TPL-001. The 36 calendar months risk assessment study cycle aligns with the 36 calendar months planned-to-be-in-service date. "Planned to be in-service" should be taken to mean all Transmission station(s) and Transmission substation(s) as modeled in the base cases for the Near-Term Transmission Planning Horizon.

Rationale for Requirement R2
The distance chosen in requirement R2 is based on guidelines that considered a variety of plausible attack scenarios capable of rendering a substation inoperable.

The drafting team choose 1500 feet or 457 meters (the shortest distance, measured substation fence line to substation fence line) in Requirement R2 is based on the study from America's Cyber Defense Agency developed in partnership with the Federal Bureau of Investigation (FBI). The Department of Homeland Security (DHS)-Department of Justice (DOJ) Bomb Threat Stand-Off Card is a quick reference guide providing recommended evacuation and shelter-in-place distances for various types and sizes of Improvised Explosive Devices (IED).[1]

Accurate simulation of the event was deemed a priority of the Drafting Team (DT). The DT felt that ownership of proximate substations, as identified in Requirement R2, was irrelevant to Bulk Electric System (BES) impact.

Rationale for Requirement R3
Per Requirement R3, each Transmission Owner is required to have a risk assessment methodology, including the criteria by which analytical results will be examined to identify Transmission station(s) or Transmission substation(s) that if rendered inoperable or damaged as a result of a physical attack could result in instability, uncontrolled separation, or Cascading within an Interconnection. The Transmission Owner is not required to develop its own methodology and is free to use a methodology developed elsewhere, such as in coordination with neighboring Transmission Owners or Independent System Operators (ISOs).

Rationale for Requirement R3, Part 3.1
Transmission Owners should determine the amount of unacceptable load loss and generation loss when determining the impact of an event to the Transmission system. Criteria for measures such as load loss or generation loss should consider the impact to the Interconnection.

Large loss of generation or load due to the evaluated disturbance could result in severe System impacts. The documented risk assessment methodology shall include the amount of unacceptable load loss and generation loss, that could result in instability, uncontrolled separation, or Cascading within an Interconnection. Conditions and thresholds used for determining critical Transmission station(s) or Transmission substation(s), i.e., those that if rendered inoperable or damaged as a result of a physical attack could result in instability, uncontrolled separation, or Cascading within an Interconnection, should be part of the documented risk assessment methodology.

It is up to the Transmission Owner to identify post-event measures that can be used to assess the criticality of a Transmission substation or Transmission substation. Suggested measures are listed below.

[1] https://www.cisa.gov/resources-tools/resources/dhs-doj-bomb-threat-stand-card

A Transmission Owner can decide that one or more of the items are not applicable to their location within the interconnection and if any additional items should be included.

The following parameters can be used to evaluate the steady-state and/or dynamic analysis:

- Steady state voltages
- Transient voltage response
- Thermal loading of Facilities
- Relay loadability
- Rotor angle stability
- Frequency exceeding generator limits
- Frequency stability
- Acceptable damping of oscillations
- Cascading line tripping
- Steady-state voltage stability

Rationale for Requirement R3, Part 3.2
The performance of both steady state and dynamics simulations is required for all applicable Transmission station(s) and substation(s). Dynamic simulations are required by the Standard because exclusively performing steady-state simulations are insufficient for determining whether the loss of a Transmission station or Transmission substation could result in instability, uncontrolled separation, or Cascading within an Interconnection.

Rationale for Requirement R3, Part 3.3
A simulation of a Fault provides a reasonable assumption for possible events that could impact a single Transmission station or Transmission substation, and for events that could simultaneously impact multiple Transmission stations or Transmission substations.

Rationale for Requirement R3, Part 3.4
The requirement that simulations shall assume the loss of communications and system protection is consistent with the SAR. In accordance with the SAR, the term “inoperable” includes the total loss of communication and protection equipment at the substation, necessitating delayed clearance from far-end relaying to isolate the event’s impacts. Each simulation should also include the removal of all Elements that Protection Systems and other controls are expected to automatically disconnect for the event.

While there are commonly used generic clearing times for remote clearing that are consistent across the industry, actual clearing times can be shorter or longer depending on conditions and design considerations at an individual Transmission Owner. The difference of a few cycles can have a significant

impact on the transient behavior of generating units, therefore, it is required that the risk analysis use actual or more conservative clearing time.

Rationale for Requirement R4
Joint ownership of Transmission substations and Transmission stations was discussed in the Guidelines and Technical Basis of previous versions of the CIP-014-3 standard, but the needed prescription on this issue was missing from the standard language. Because the CIP-014-4 Risk Assessment Refinement SAR calls for clarification regarding Transmission substations and Transmission stations of differing ownership, this section was clarified in Requirement R4.

Rationale for Requirement R5
An objective of the CIP-014-3 Risk Assessment Refinement SAR was to align study periods, frequency of studies and the powerflow models used for the studies. A 36-month periodicity was chosen for the R5 risk assessment to reduce the periodicity options from previous versions of the standard. Additionally, a single study periodicity is more easily aligned with project in-service date considerations and model choices. As called for in Project Scope item 3 of the CIP-014-3 Risk Assessment Refinement SAR, the risk assessment must comply with the methodology developed in R3, so this language was explicitly added to R5.

Transmission Owners shall review and, if necessary, update the list of applicable Transmission station(s) or Transmission substation(s) per Attachment 1 at least once every 36 months. The list of applicable Transmission station(s) or Transmission substation(s) shall include existing or planned to be in service within 36 months Transmission station(s) and Transmission substation(s). The 36-month cycle for updating the list of applicable Transmission station(s) or Transmission substation(s) per Attachment 1 aligns with the annual cycle for performing Planning Assessments per NERC Standard TPL-001. The 36-month risk assessment study cycle aligns with the 36-month planned-to-be-in-service date.

In addition to the performance of the risk assessment using Transmission station(s) and Transmission substation(s) identified in Requirement R1, any proximate Transmission station(s) and Transmission substation(s) identified in Requirement R2 should also be included in the risk assessment. Furthermore, any Transmission station(s) and Transmission substation(s) assessed due to having been identified per Requirement R1 should also be run as part of a proximate Transmission station(s) and Transmission substation(s) group per Requirement R2 if such an identification is made.

Rationale for Requirement R5, Part 5.1
If a Transmission Owner performs a steady state analysis and identifies a Transmission station or substation that, if rendered inoperable or damaged, could result in instability, uncontrolled separation, or Cascading within an Interconnection, then dynamic analysis is not required for that Transmission station or substation. If a Transmission Owner performs a dynamic analysis and identifies a Transmission station or substation that, if rendered inoperable or damaged, could result in instability, uncontrolled separation, or Cascading within an Interconnection, then steady state analysis is not required for that Transmission station or substation.

Rationale for Requirement R5, Part 5.2

The intent of this Requirement is that Transmission Owners do not have to reassess already identified and protected Transmission stations or substations (Requirement R5.3 and Requirements R7 through R10 still apply to those Transmission stations or substations). A new risk assessment will need to be performed if the Transmission owner wishes to determine whether or not a Transmission station or substation can be removed from identification and protection as outlined in Requirement R7.1.

Rationale for Requirement R5, Part 5.3

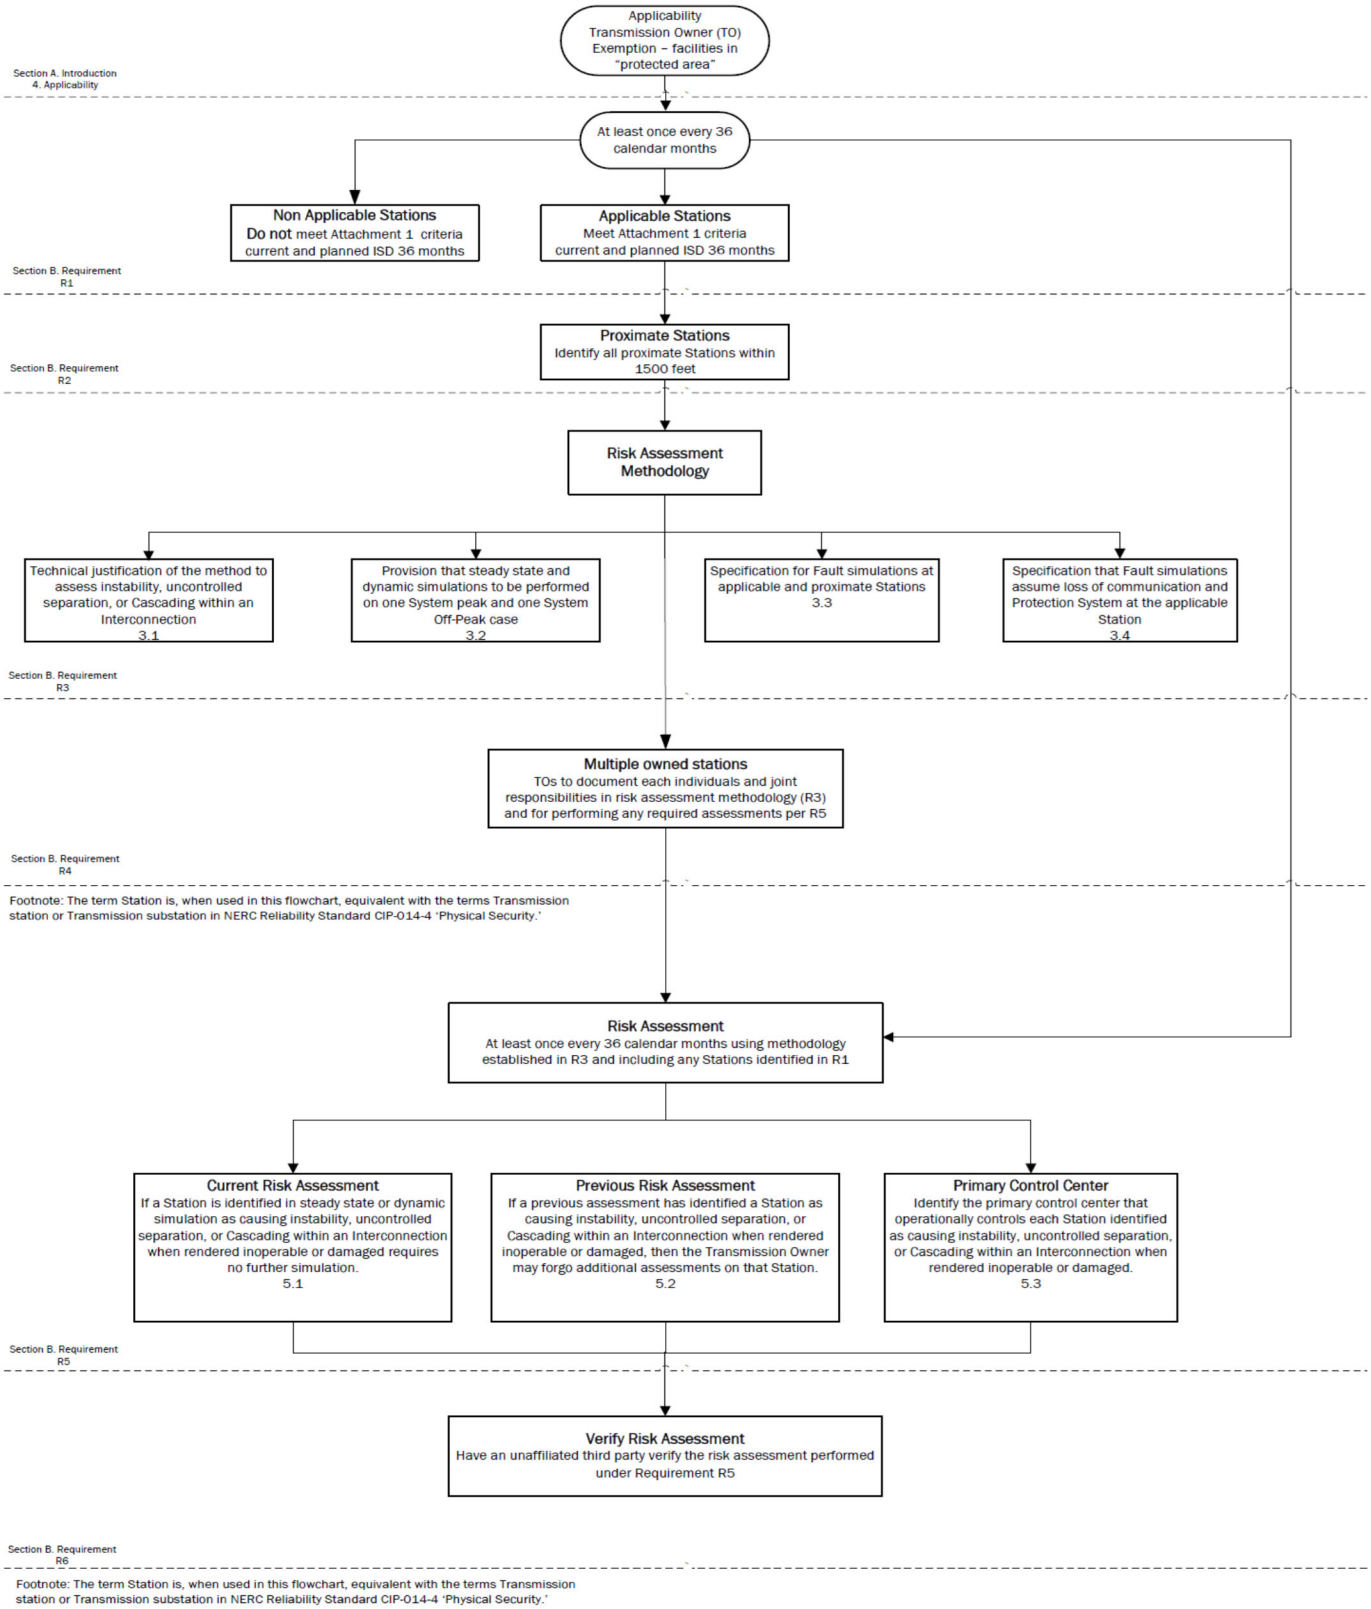
Identification of Primary Control Centers: After completing the risk assessment under Requirement R5 and verified under Requirement R6, it is important to additionally identify the primary control center that operationally controls each Transmission station or Transmission substation, that if rendered inoperable or damaged could result in instability, uncontrolled separation, or Cascading within an Interconnection. A primary control center "operationally controls" a Transmission station or Transmission substation when the control center's electronic actions can cause direct physical actions at the identified Transmission station and Transmission substation, such as opening a breaker.

Rationale for Implementation Plan

The Drafting Team has determined that 24 calendar months for the CIP-014-4 implementation plan would allow adequate time for Transmission Owners and Transmission Operators to determine applicability, develop criteria, write or revise methodologies, perform assessments, and procure unaffiliated third parties for risk assessment verification (which some Transmission Owners have performed concurrently with their risk assessment analyses.

CIP-014-4 Flowchart

The flowchart is a concise outline that guides through the steps for completing the risk assessment at least once every 36 calendar months, based on the Applicability in Attachment 1 and Requirements R1-R5.



Applicability
Transmission Owner (TO) Exemption – facilities in "protected area"
Section A. Introduction
4. Applicability
At least once every 36 calendar months
Non Applicable Stations
Do not meet Attachment 1 criteria current and planned ISD 36 months
Applicable Stations
Meet Attachment 1 criteria current and planned ISD 36 months
Section B. Requirement
R1
Proximate Stations
Identify all proximate Stations within 1500 feet
Section B. Requirement
R2
Risk Assessment Methodology
Technical justification of the method to assess instability, uncontrolled separation, or Cascading within an Interconnection
3.1
Provision that steady state and dynamic simulations to be performed on one System peak and one System Off-Peak case
3.2
Specification for Fault simulations at applicable and proximate Stations
3.3
Specification that Fault simulations assume loss of communication and Protection System at the applicable Station
3.4
Section B. Requirement
R3
Multiple owned stations
TOs to document each individuals and joint responsibilities in risk assessment methodology (R3) and for performing any required assessments per R5
Section B. Requirement
R4
Footnote: The term Station is, when used in this flowchart, equivalent with the terms Transmission station or Transmission substation in NERC Reliability Standard CIP-014-4 'Physical Security.'
Risk Assessment
At least once every 36 calendar months using methodology established in R3 and including any Stations identified in R1
Current Risk Assessment
If a Station is identified in steady state or dynamic simulation as causing instability, uncontrolled separation, or Cascading within an Interconnection when rendered inoperable or damaged requires no further simulation.
5.1
Previous Risk Assessment
If a previous assessment has identified a Station as causing instability, uncontrolled separation, or Cascading within an Interconnection when rendered inoperable or damaged, then the Transmission Owner may forgo additional assessments on that Station.
5.2
Primary Control Center
Identify the primary control center that operationally controls each Station identified as causing instability, uncontrolled separation, or Cascading within an Interconnection when rendered inoperable or damaged.
5.3
Section B. Requirement
R5
Verify Risk Assessment
Have an unaffiliated third party verify the risk assessment performed under Requirement R5
Section B. Requirement
R6
Footnote: The term Station is, when used in this flowchart, equivalent with the terms Transmission station or Transmission substation in NERC Reliability Standard CIP-014-4 'Physical Security.'

Technical Rationale for Reliability Standard CIP-014-3

This section contains a "cut and paste" of the former Guidelines and Technical Basis (GTB) as-is of from CIP-014-3 standard to preserve any historical references. No modifications have been made.

Requirement R2 (This is Requirement R6 in CIP-014-4)
This requirement specifies verification of the risk assessment performed under Requirement R1 by an entity other than the owner or operator of the Requirement R1 risk assessment.

A verification of the risk assessment by an unaffiliated third party, as specified in Requirement R2, could consist of:

1. Certifying that the Requirement R1 risk assessment considers the Transmission stations and Transmission substations identified in Applicability Section 4.1.1.
2. Review of the model used to conduct the risk assessment to ensure it contains sufficient system topology to identify Transmission stations and Transmission substations that if rendered inoperable or damaged could cause instability, uncontrolled separation, or Cascading within an Interconnection.
3. Review of the Requirement R1 risk assessment methodology.

This requirement provides the flexibility for a Transmission Owner to select from unaffiliated registered and non-registered entities with transmission planning or analysis experience to perform the verification of the Requirement R1 risk assessment. The term unaffiliated means that the selected verifying entity cannot be a corporate affiliate (*i.e.,* the verifying or third party reviewer cannot be an entity that corporately controls, is controlled by or is under common control with, the Transmission Owner). The verifying entity also cannot be a division of the Transmission Owner that operates as a functional unit.

The prohibition on registered entities using a corporate affiliate to conduct the verification, however, does not prohibit a governmental entity (e.g., a city, a municipality, a U.S. federal power marketing agency, or any other political subdivision of U.S. or Canadian federal, state, or provincial governments) from selecting as the verifying entity another governmental entity within the same political subdivision. For instance, a U.S. federal power marketing agency may select as its verifier another U.S. federal agency to conduct its verification so long as the selected entity has transmission planning or analysis experience. Similarly, a Transmission Owner owned by a Canadian province can use a separate agency of that province to perform the verification. The verifying entity, however, must still be a third party and cannot be a division of the registered entity that operates as a functional unit.

Requirement R2 also provides that the "verification may occur concurrent with or after the risk assessment performed under Requirement R1." This provision is designed to provide the Transmission Owner the flexibility to work with the verifying entity throughout (*i.e.,* concurrent with) the risk assessment, which for some Transmission Owners may be more efficient and effective. In other words, a Transmission Owner could collaborate with their unaffiliated verifying entity to perform the risk assessment under Requirement R1 such that both Requirement R1 and Requirement R2 are satisfied

concurrently. The intent of Requirement R2 is to have an entity other than the owner or operator of the facility to be involved in the risk assessment process and have an opportunity to provide input. Accordingly, Requirement R2 is designed to allow entities the discretion to have a two-step process, where the Transmission Owner performs the risk assessment and subsequently has a third party review that assessment, or a one-step process, where the entity collaborates with a third party to perform the risk assessment.

Characteristics to consider in selecting a third party reviewer could include:

- Registered Entity with applicable planning and reliability functions.
- Experience in power system studies and planning.
- The entity's understanding of the MOD standards, TPL standards, and facility ratings as they pertain to planning studies.
- The entity's familiarity with the Interconnection within which the Transmission Owner is located.

With respect to the requirement that Transmission owners develop and implement procedures for protecting confidential and sensitive information, the Transmission Owner could have a method for identifying documents that require confidential treatment. One mechanism for protecting confidential or sensitive information is to prohibit removal of sensitive or confidential information from the Transmission Owner's site. Transmission Owners could include such a prohibition in a non-disclosure agreement with the verifying entity.

A Technical feasibility study is not required in the Requirement R2 documentation of the technical basis for not modifying the identification in accordance with the recommendation.

On the issue of the difference between a verifier in Requirement R2 and a reviewer in Requirement R6, the SDT indicates that the verifier will confirm that the risk assessment was completed in accordance with Requirement R1, including the number of Transmission stations and substations identified, while the reviewer in Requirement R6 is providing expertise on the manner in which the evaluation of threats was conducted in accordance with Requirement R4, and the physical security plan in accordance with Requirement R5. In the latter situation there is no verification of a technical analysis, rather an application of experience and expertise to provide guidance or recommendations, if needed.

Parts 2.4 and 6.4 require the entities to have procedures to protect the confidentiality of sensitive or confidential information. Those procedures may include the following elements:

1. Control and retention of information on site for third party verifiers/reviewers.
2. Only "need to know" employees, etc., get the information.
3. Marking documents as confidential
4. Securely storing and destroying information when no longer needed.

5. Not releasing information outside the entity without, for example, General Counsel sign-off.

Requirement R3 (This is now Requirement R7 in CIP-014-4)
Some Transmission Operators will have obligations under this standard for certain primary control centers. Those obligations, however, are contingent upon a Transmission Owner first completing the risk assessment specified by Requirement R1 and the verification specified by Requirement R2. Requirement R3 is intended to ensure that a Transmission Operator that has operational control of a primary control center identified in Requirement R1 receive notice so that the Transmission Operator may fulfill the rest of the obligations required in Requirements R4 through R6. Since the timing obligations in Requirements R4 through R6 are based upon completion of Requirement R2, the Transmission Owner must also include within the notice the date of completion of Requirement R2. Similarly, the Transmission Owner must notify the Transmission Operator of any removals from identification that result from a subsequent risk assessment under Requirement R1 or as a result of the verification process under Requirement R2.

Requirement R4 (This is now Requirement R8 in CIP-014-4)
This requirement requires owners and operators of facilities identified by the Requirement R1 risk assessment and that are verified under Requirement R2 to conduct an assessment of potential threats and vulnerabilities to those Transmission stations, Transmission substations, and primary control centers using a tailored evaluation process. Threats and vulnerabilities may vary from facility to facility based on any number of factors that include, but are not limited to, location, size, function, existing physical security protections, and attractiveness as a target.

In order to effectively conduct a threat and vulnerability assessment, the asset owner may be the best source to determine specific site vulnerabilities, but current and evolving threats may best be determined by others in the intelligence or law enforcement communities. A number of resources have been identified in the standard, but many others exist and asset owners are not limited to where they may turn for assistance. Additional resources may include state or local fusion centers, U.S. Department of Homeland Security, Federal Bureau of Investigations (FBI), Public Safety Canada, Royal Canadian Mounted Police, and InfraGard chapters coordinated by the FBI.

The Responsible Entity is required to take a number of factors into account in Parts 4.1 to 4.3 in order to make a risk-based evaluation under Requirement R4.

To assist in determining the current threat for a facility, the prior history of attacks on similarly protected facilities should be considered when assessing probability and likelihood of occurrence at the facility in question.

Resources that may be useful in conducting threat and vulnerability assessments include:

- NERC Security Guideline for the Electricity Sector: Physical Security.
- NERC Security Guideline: Physical Security Response.

- ASIS International General Risk Assessment Guidelines.
- ASIS International Facilities Physical Security Measure Guideline.
- ASIS International Security Management Standard: Physical Asset Protection.
- Whole Building Design Guide - Threat/Vulnerability Assessments.

Requirement R5 (This is now Requirement R9 in CIP-014-4)
This requirement specifies development and implementation of a security plan(s) designed to protect against attacks to the facilities identified in Requirement R1 based on the assessment performed under Requirement R4.

Requirement R5 specifies the following attributes for the physical security plan:

- *Resiliency or security measures designed collectively to deter, detect, delay, assess, communicate, and respond to potential physical threats and vulnerabilities identified during the evaluation conducted in Requirement R4.*

  Resiliency may include, among other things:

  a. System topology changes,

  b. Spare equipment,

  c. Construction of a new Transmission station or Transmission substation.

  While most security measures will work together to collectively harden the entire site, some may be allocated to protect specific critical components. For example, if protection from gunfire is considered necessary, the entity may only install ballistic protection for critical components, not the entire site.

- *Law enforcement contact and coordination information.*

  Examples of such information may be posting 9-1-1 for emergency calls and providing substation safety and familiarization training for local and federal law enforcement, fire department, and Emergency Medical Services.

- *A timeline for executing the physical security enhancements and modifications specified in the physical security plan.*

  Entities have the flexibility to prioritize the implementation of the various resiliency or security enhancements and modifications in their security plan according to risk, resources, or other factors. The requirement to include a timeline in the physical security plan for executing the actual physical security enhancements and modifications does not also require that the enhancements and modifications be completed within 120 days. The actual timeline may extend beyond the 120 days, depending on the amount of work to be completed.

- *Provisions to evaluate evolving physical threats, and their corresponding security measures, to the Transmission station(s), Transmission substation(s), or primary control center(s).*

A registered entity's physical security plan should include processes and responsibilities for obtaining and handling alerts, intelligence, and threat warnings from various sources. Some of these sources could include the ERO, ES-ISAC, and US and/or Canadian federal agencies. This information should be used to reevaluate or consider changes in the security plan and corresponding security measures of the security plan found in R5.

Incremental changes made to the physical security plan prior to the next required third party review do not require additional third party reviews.

Requirement R6 (This is now Requirement R10 in CIP-014-4)
This requirement specifies review by an entity other than the Transmission Owner or Transmission Operator with appropriate expertise for the evaluation performed according to Requirement R4 and the security plan(s) developed according to Requirement R5. As with Requirement R2, the term unaffiliated means that the selected third party reviewer cannot be a corporate affiliate (*i.e.,* the third party reviewer cannot be an entity that corporately controls, is controlled by or is under common control with, the Transmission Operator). A third party reviewer also cannot be a division of the Transmission Operator that operates as a functional unit.

As noted in the guidance for Requirement R2, the prohibition on registered entities using a corporate affiliate to conduct the review, however, does not prohibit a governmental entity from selecting as the third party reviewer another governmental entity within the same political subdivision. For instance, a city or municipality may use its local enforcement agency, so long as the local law enforcement agency satisfies the criteria in Requirement R6. The third party reviewer, however, must still be a third party and cannot be a division of the registered entity that operates as a functional unit.

The Responsible Entity can select from several possible entities to perform the review:

- *An entity or organization with electric industry physical security experience and whose review staff has at least one member who holds either a Certified Protection Professional (CPP) or Physical Security Professional (PSP) certification.*

  In selecting CPP and PSP for use in this standard, the SDT believed it was important that if a private entity such as a consulting or security firm was engaged to conduct the third party review, they must tangibly demonstrate competence to conduct the review. This includes electric industry physical security experience and either of the premier security industry certifications sponsored by ASIS International. The ASIS certification program was initiated in 1977, and those that hold the CPP certification are board certified in security management. Those that hold the PSP certification are board certified in physical security.

- *An entity or organization approved by the ERO.*
- *A governmental agency with physical security expertise.*
- *An entity or organization with demonstrated law enforcement, government, or military physical security expertise.*

As with the verification under Requirement R2, Requirement R6 provides that the "review may occur concurrently with or after completion of the evaluation performed under Requirement R4 and the security plan development under Requirement R5." This provision is designed to provide applicable Transmission Owners and Transmission Operators the flexibility to work with the third party reviewer throughout (*i.e.,* concurrent with) the evaluation performed according to Requirement R4 and the security plan(s) developed according to Requirement R5, which for some Responsible Entities may be more efficient and effective. In other words, a Transmission Owner or Transmission Operator could collaborate with their unaffiliated third party reviewer to perform an evaluation of potential threats and vulnerabilities (Requirement R4) and develop a security plan (Requirement R5) to satisfy Requirements R4 through R6 simultaneously. The intent of Requirement R6 is to have an entity other than the owner or operator of the facility to be involved in the Requirement R4 evaluation and the development of the Requirement R5 security plans and have an opportunity to provide input on the evaluation and the security plan. Accordingly, Requirement R6 is designed to allow entities the discretion to have a two-step process, where the Transmission Owner performs the evaluation and develops the security plan itself and then has a third party review that assessment, or a one-step process, where the entity collaborates with a third party to perform the evaluation and develop the security plan.

Rationale for Attachment 1

The DT moved the applicability language from CIP-014-3 to Attachment 1 to make the standard easier to read.

The purpose of Reliability Standard CIP-014 is to protect Transmission stations and Transmission substations, and their associated primary control centers that if rendered inoperable or damaged as a result of a physical attack could result in instability, uncontrolled separation, or Cascading within an Interconnection. To properly include those entities that own or operate such Facilities, the Reliability Standard CIP-014 first applies to Transmission Owners that own Transmission Facilities that meet the specific criteria in Applicability Section 4.1.1.1 through 4.1.1.4. The Facilities described in Applicability Section 4.1.1.1 through 4.1.1.4 mirror those Transmission Facilities that meet the bright line criteria for "Medium Impact" Transmission Facilities under Attachment 1 of Reliability Standard CIP-002-5.1. Each Transmission Owner that owns Transmission Facilities that meet the criteria in Section 4.1.1.1 through 4.1.1.4 is required to perform a risk assessment as specified in Requirement R1 to identify its Transmission stations and Transmission substations, and their associated primary control centers, that if rendered inoperable or damaged as a result of a physical attack could result in instability, uncontrolled separation, or Cascading within an Interconnection. The Standard Drafting Team (SDT) expects this population will be small and that many Transmission Owners that meet the applicability of this standard will not actually identify any such Facilities. Only those Transmission Owners with Transmission stations or Transmission substations identified in the risk assessment (and verified under Requirement R2) have performance obligations under Requirements R3 through R6.

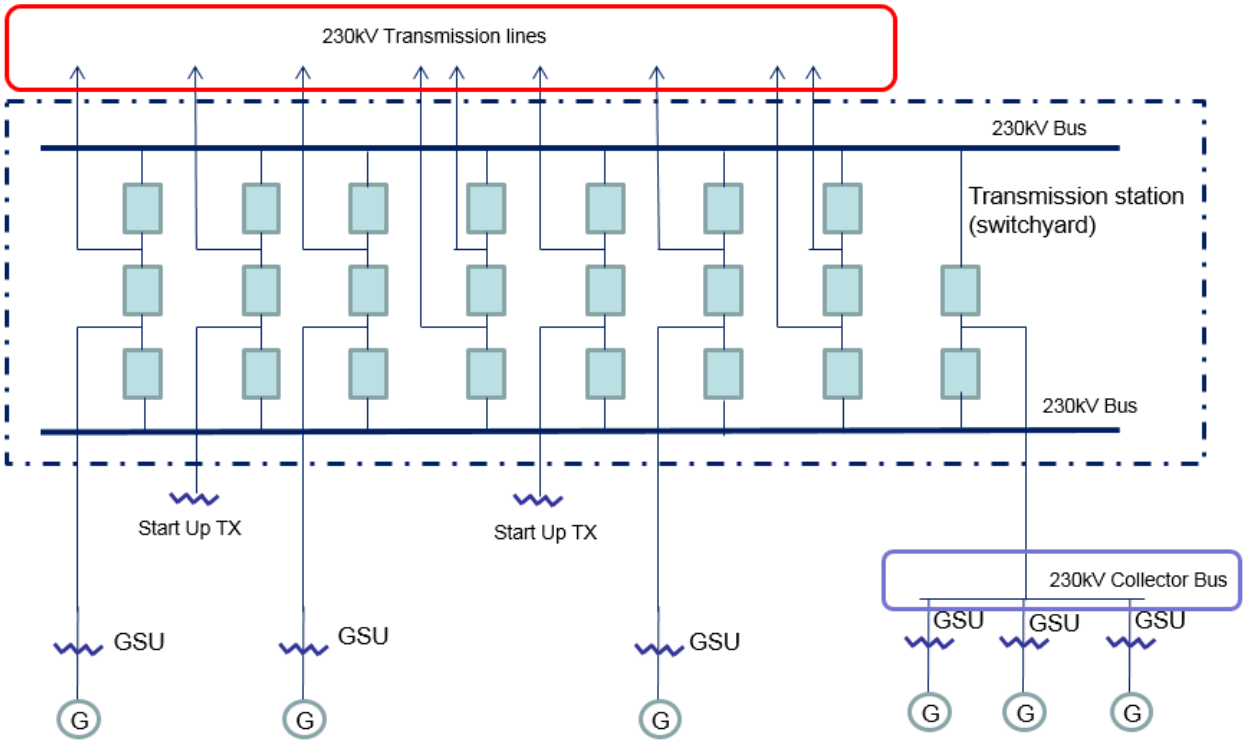
This standard also applies to Transmission Operators. A Transmission Operator's obligations under the standard, however, are only triggered if the Transmission Operator is notified by an applicable Transmission Owner under Requirement R3 that the Transmission Operator operates a primary control center that operationally controls a Transmission station(s) or Transmission substation(s) identified in the Requirement R1 risk assessment. A primary control center operationally controls a Transmission station

or Transmission substation when the control center's electronic actions can cause direct physical action at the identified Transmission station or Transmission substation, such as opening a breaker, as opposed to a control center that only has information from the Transmission station or Transmission substation and must coordinate direct action through another entity. Only Transmission Operators who are notified that they have primary control centers under this standard have performance obligations under Requirements R4 through R6. In other words, primary control center for purposes of this Standard is the control center that the Transmission Owner or Transmission Operator, respectively, uses as its primary, permanently-manned site to physically operate a Transmission station or Transmission substation that is identified in Requirement R1 and verified in Requirement R2. Control centers that provide back-up capability are not applicable, as they are a form of resiliency and intentionally redundant.

The SDT considered several options for bright line criteria that could be used to determine applicability and provide an initial threshold that defines the set of Transmission stations and Transmission substations that would meet the directives of the FERC order on physical security (*i.e.*, those that could cause instability, uncontrolled separation, or Cascading within an Interconnection). The SDT determined that using the criteria for Medium Impact Transmission Facilities in Attachment 1 of CIP-002-5.1 would provide a conservative threshold for defining which Transmission stations and Transmission substations must be included in the risk assessment in Requirement R1 of CIP-014. Additionally, the SDT concluded that using the CIP-002-5.1 Medium Impact criteria was appropriate because it has been approved by stakeholders, NERC, and FERC, and its use provides a technically sound basis to determine which Transmission Owners should conduct the risk assessment. As described in CIP-002-5.1, the failure of a Transmission station or Transmission substation that meets the Medium Impact criteria could have the capability to result in exceeding one or more Interconnection Reliability Operating Limits (IROLs). The SDT understands that using this bright line criteria to determine applicability may require some Transmission Owners to perform risk assessments under Requirement R1 that will result in a finding that none of their Transmission stations or Transmission substations would pose a risk of instability, uncontrolled separation, or Cascading within an Interconnection. However, the SDT determined that higher bright lines could not be technically justified to ensure inclusion of all Transmission stations and Transmission substations, and their associated primary control centers that, if rendered inoperable or damaged as a result of a physical attack could result in instability, uncontrolled separation, or Cascading within an Interconnection. Further guidance and technical basis for the bright line criteria for Medium Impact Facilities can be found in the Guidelines and Technical Basis section of CIP-002-5.1.

Additionally, the SDT determined that it was not necessary to include Generator Operators and Generator Owners in the Reliability Standard. First, Transmission stations or Transmission substations interconnecting generation facilities are considered when determining applicability. Transmission Owners will consider those Transmission stations and Transmission substations that include a Transmission station on the high side of the Generator Step-up transformer (GSU) using Applicability Section 4.1.1.1 and 4.1.1.2. As an example, a Transmission station or Transmission substation identified as a Transmission Owner facility that interconnects generation will be subject to the Requirement R1 risk assessment if it operates at 500kV or greater or if it is connected at 200 kV – 499kV to three or more other Transmission stations or Transmission substations and has an "aggregate weighted value" exceeding 3000 according to the table in Applicability Section 4.1.1.2. Second, the Transmission analysis or analyses conducted under

Requirement R1 should take into account the impact of the loss of generation connected to applicable Transmission stations or Transmission substations. Additionally, the FERC order does not explicitly mention generation assets and is reasonably understood to focus on the most critical Transmission Facilities. The diagram below shows an example of a station.

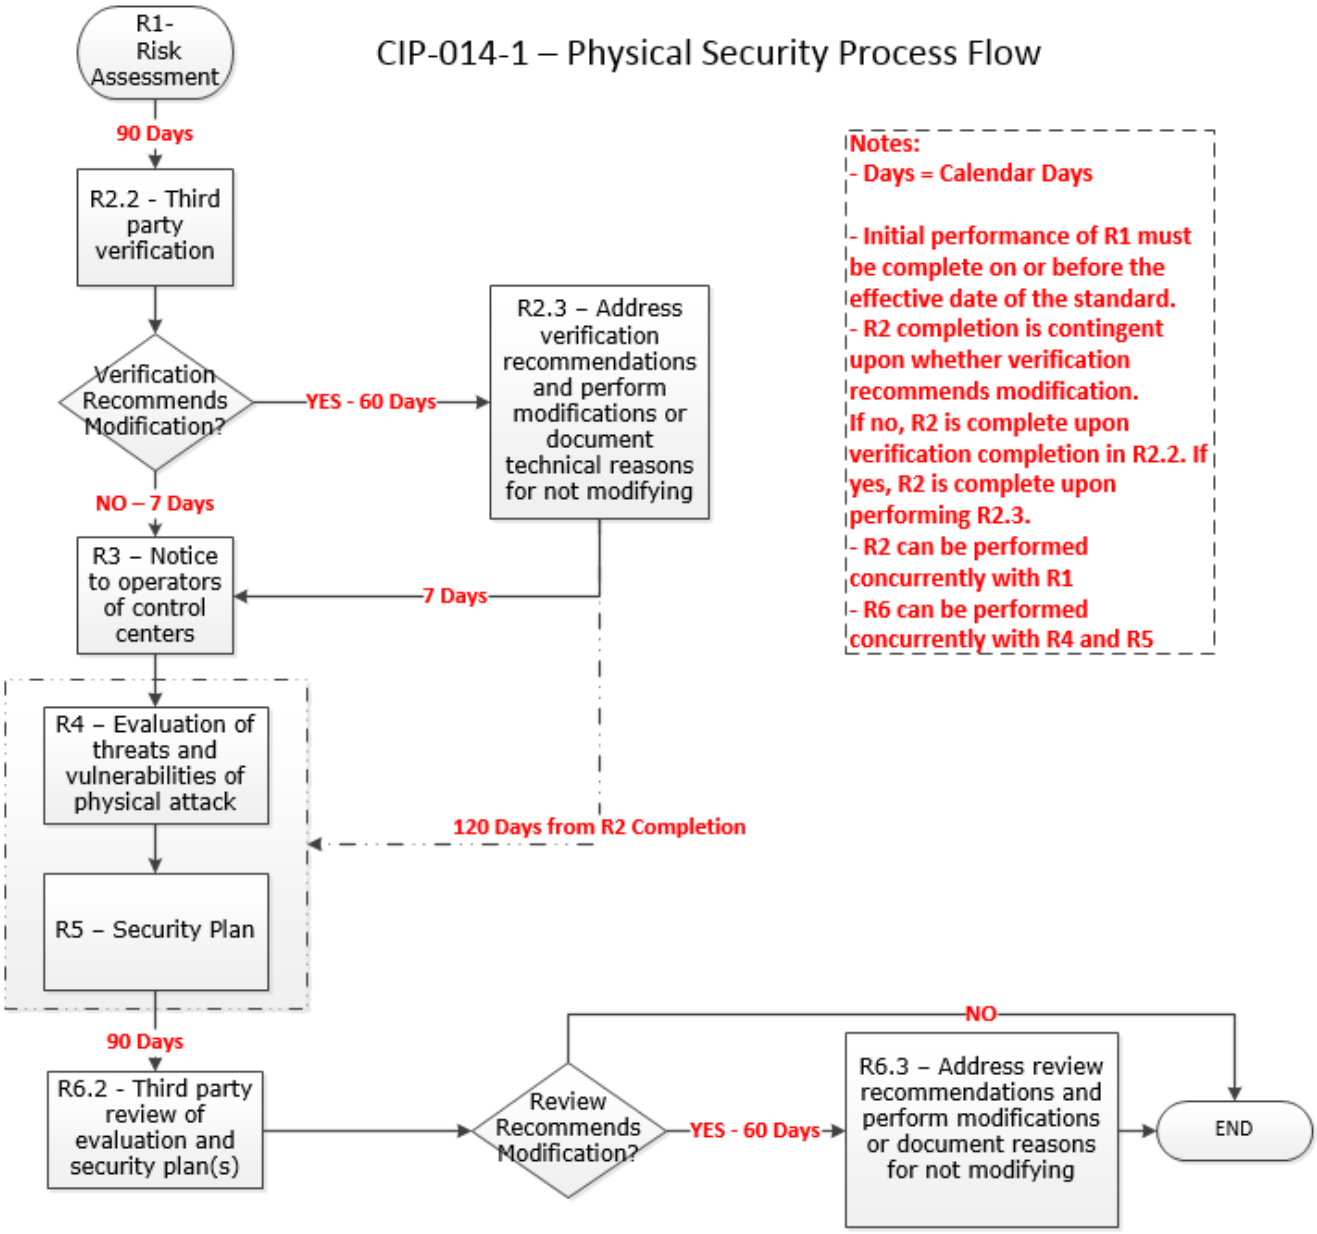


Also, the SDT uses the phrase "Transmission stations or Transmission substations" to recognize the existence of both stations and substations. Many entities in industry consider a substation to be a location with physical borders (i.e. fence, wall, etc.) that contains at least an autotransformer. Locations also exist that do not contain autotransformers, and many entities in industry refer to those locations as stations (switching stations or switchyards). Therefore, the SDT chose to use both "station" and "substation" to refer to the locations where groups of Transmission Facilities exist.

On the issue of joint ownership, the SDT recognizes that this issue is not unique to CIP-014, and expects that the applicable Transmission Owners and Transmission Operators will develop memorandums of understanding, agreements, Coordinated Functional Registrations, or procedures, etc., to designate responsibilities under CIP-014 when joint ownership is at issue, which is similar to what many entities have completed for other Reliability Standards.

The language contained in the applicability section regarding the collector bus is directly copied from CIP-002-5.1, Attachment 1, and has no additional meaning within the CIP-014 standard.

Timeline



CIP-014-1 – Physical Security Process Flow
R1- Risk Assessment
90 Days
R2.2 - Third party verification
Verification Recommends Modification?
YES - 60 Days
R2.3 – Address verification recommendations and perform modifications or document technical reasons for not modifying
NO – 7 Days
R3 – Notice to operators of control centers
7 Days
R4 – Evaluation of threats and vulnerabilities of physical attack
120 Days from R2 Completion
R5 – Security Plan
90 Days
R6.2 - Third party review of evaluation and security plan(s)
Review Recommends Modification?
YES - 60 Days
NO
R6.3 – Address review recommendations and perform modifications or document reasons for not modifying
END
Notes:
- Days = Calendar Days
- Initial performance of R1 must be complete on or before the effective date of the standard.
- R2 completion is contingent upon whether verification recommends modification. If no, R2 is complete upon verification completion in R2.2. If yes, R2 is complete upon performing R2.3.
- R2 can be performed concurrently with R1
- R6 can be performed concurrently with R4 and R5

Rationale

During development of this standard, text boxes were embedded within the standard to explain the rationale for various parts of the standard. Upon BOT approval, the text from the rationale text boxes was moved to this section.

Rationale for Requirement R1 (This is for the old Requirement R1 in CIP-014-3):
This requirement meets the FERC directive from paragraph 6 of its March 7, 2014 order on physical security to perform a risk assessment to identify which facilities if rendered inoperable or damaged could impact an Interconnection through instability, uncontrolled separation, or cascading failures. The requirement is not intended to bring within the scope of the standard a Transmission station or Transmission substation unless the applicable Transmission Owner determines through technical studies and analyses based on objective analysis, technical expertise, operating experience and experienced judgment that the loss of such facility would have a critical impact on the operation of the Interconnection in the event the asset is rendered inoperable or damaged. In the November 20, 2014 Order, FERC reiterated that "only an instability that has a "critical impact on the operation of the interconnection" warrants finding that the facility causing the instability is critical under Requirement R1." The Transmission Owner may determine the criteria for critical impact by considering, among other criteria, any of the following:

- Criteria or methodology used by Transmission Planners or Planning Coordinators in TPL-001-4, Requirement R6
- NERC EOP-004-2 reporting criteria
- Area or magnitude of potential impact

Requirement R1 also meets the FERC directive for periodic reevaluation of the risk assessment by requiring the risk assessment to be performed every 30 months (or 60 months for an entity that has not identified in a previous risk assessment any Transmission stations or Transmission substations that if rendered inoperable or damaged could result in instability, uncontrolled separation, or Cascading within an Interconnection).

After identifying each Transmission station and Transmission substation that meets the criteria in Requirement R1, it is important to additionally identify the primary control center that operationally controls that Transmission station or Transmission substation (*i.e.,* the control center whose electronic actions can cause direct physical actions at the identified Transmission station and Transmission substation, such as opening a breaker, compared to a control center that only has the ability to monitor the Transmission station and Transmission substation and, therefore, must coordinate direct physical action through another entity).

Rationale for Requirement R2 (This is now Requirement R6 in CIP-014-4):
This requirement meets the FERC directive from paragraph 11 in the order on physical security requiring verification by an entity other than the owner or operator of the risk assessment performed under Requirement R1.

This requirement provides the flexibility for a Transmission Owner to select registered and non-registered entities with transmission planning or analysis experience to perform the verification of the Requirement R1 risk assessment. The term "unaffiliated" means that the selected verifying entity cannot be a corporate affiliate (*i.e.*, the verifying entity cannot be an entity that controls, is controlled by, or is under common control with, the Transmission owner). The verifying entity also cannot be a division of the Transmission Owner that operates as a functional unit. The term "unaffiliated" is not intended to prohibit a governmental entity from using another government entity to be a verifier under Requirement R2.

Requirement R2 also provides the Transmission Owner the flexibility to work with the verifying entity throughout the Requirement R1 risk assessment, which for some Transmission Owners may be more efficient and effective. In other words, a Transmission Owner could coordinate with their unaffiliated verifying entity to perform a Requirement R1 risk assessment to satisfy both Requirement R1 and Requirement R2 concurrently.

Planning Coordinator is a functional entity listed in Part 2.1. The Planning Coordinator and Planning Authority are the same entity as shown in the NERC Glossary of Terms Used in NERC Reliability Standards.

Rationale for Requirement R3 (This is now Requirement R7 in CIP-014-4):
Some Transmission Operators will have obligations under this standard for certain primary control centers. Those obligations, however, are contingent upon a Transmission Owner first identifying which Transmission stations and Transmission substations meet the criteria specified by Requirement R1, as verified according to Requirement R2. This requirement is intended to ensure that a Transmission Operator that has operational control of a primary control center identified in Requirement R1, Part 1.2 of a Transmission station or Transmission substation verified according to Requirement R2 receives notice of such identification so that the Transmission Operator may timely fulfill its resulting obligations under Requirements R4 through R6. Since the timing obligations in Requirements R4 through R6 are based upon completion of Requirement R2, the Transmission Owner must also include notice of the date of completion of Requirement R2. Similarly, the Transmission Owner must notify the Transmission Operator of any removals from identification that result from a subsequent risk assessment under Requirement R1 or the verification process under Requirement R2.

Rationale for Requirement R4 (This is now Requirement R8 in CIP-014-4):
This requirement meets the FERC directive from paragraph 8 in the order on physical security that the reliability standard must require tailored evaluation of potential threats and vulnerabilities to facilities identified in Requirement R1 and verified according to Requirement R2. Threats and vulnerabilities may vary from facility to facility based on factors such as the facility's location, size, function, existing protections, and attractiveness of the target. As such, the requirement does not mandate a one-size-fits-all approach but requires entities to account for the unique characteristics of their facilities.

Requirement R4 does not explicitly state when the evaluation of threats and vulnerabilities must occur or be completed. However, Requirement R5 requires that the entity's security plan(s), which is dependent on the Requirement R4 evaluation, must be completed within 120 calendar days following completion of Requirement R2. Thus, an entity has the flexibility when to complete the Requirement R4 evaluation,

provided that it is completed in time to comply with the requirement in Requirement R5 to develop a physical security plan 120 calendar days following completion of Requirement R2.

Rationale for Requirement R5 (This is now Requirement R9 in CIP-014-4):
This requirement meets the FERC directive from paragraph 9 in the order on physical security requiring the development and implementation of a security plan(s) designed to protect against attacks to the facilities identified in Requirement R1 based on the assessment performed under Requirement R4.

Rationale for Requirement R6 (This is now Requirement R10 in CIP-014-4):
This requirement meets the FERC directive from paragraph 11 in the order on physical security requiring review by an entity other than the owner or operator with appropriate expertise of the evaluation performed according to Requirement R4 and the security plan(s) developed according to Requirement R5.

As with the verification required by Requirement R2, Requirement R6 provides Transmission Owners and Transmission Operators the flexibility to work with the third party reviewer throughout the Requirement R4 evaluation and the development of the Requirement R5 security plan(s). This would allow entities to satisfy their obligations under Requirement R6 concurrent with the satisfaction of their obligations under Requirements R4 and R5.

NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

Technical Rationale

Project 2023-06 CIP-014 Risk Assessment Refinement
Reliability Standard CIP-014-4 | ~~September 2024~~June 2025

CIP-014-4 – Physical Security

In performing the risk assessment, the Transmission Owner should first identify their population of Transmission stations and Transmission substations that meet the criteria contained in Attachment 1. The Standard requires the Transmission Owner to perform a risk assessment, consisting of ~~a~~ transmission ~~analysis,~~analyses to determine which of those Transmission stations and Transmission Substations, if rendered inoperable or damaged, could result in instability, uncontrolled separation, or Cascading within an Interconnection.

The purpose of Reliability Standard CIP-014 is to protect Transmission stations and Transmission substations, and their associated primary control centers, that if rendered inoperable or damaged, as a result of a physical attack, could result in instability, uncontrolled separation, or Cascading within an Interconnection. To properly identify candidates for such Transmission station(s) and Transmission substation(s), the Transmission Owner shall evaluate the criteria listed in Attachment 1.

Rationale for Requirement R1

In the previous version of CIP-014, the 30-month time frame and the 24-month planned-to-be-in-service date could, if not carefully applied, lead to gaps between models and study horizons. Per the Standard Authorization Request (SAR), CIP-014-4 has consolidated these multiple timelines into one.

~~Performing Risk Assessments~~

Requirement R1 is ~~developed~~revised to ensure that each Transmission Owner establishes a list of applicable Transmission station(s) or Transmission substation(s) in accordance with Attachment 1. Aligning the 36 calendar months look ahead in Requirement R1 with the 36 calendar month risk assessment cycle ensures that system topology of the cases used to assess applicability is consistent with the system topology in the risk assessment models.

Transmission Owners shall review and, if necessary, update the list of applicable Transmission station(s) or Transmission substation(s) per Attachment 1 at least once every 36 calendar months. The list of applicable Transmission station(s) or Transmission substation(s) shall include existing or planned to be in service within 36 calendar months Transmission station(s) and Transmission substation(s). The 36 calendar months cycle for updating the list of applicable Transmission station(s) or Transmission substation(s) per Attachment 1 aligns with the annual cycle for performing Planning Assessments per NERC Standard TPL-001. The 36 calendar months risk assessment study cycle aligns with the 36 calendar months planned-to-be-in-service date. "Planned to be in-service" should be taken to mean all Transmission station(s) and Transmission substation(s) as modeled in the base cases for the Near-Term Transmission Planning Horizon.

Rationale for Requirement R2

~~Each Transmission Owner shall, at a minimum, consider the specifications in Requirement R2 for general applicability to their systems, and whether specifications and thresholds need to be stipulated for each Parts 2.1 and 2.2 in their documented criteria.~~

The distance chosen in requirement R2 is based on guidelines that considered a variety of plausible attack scenarios capable of rendering a substation inoperable.

~~A certain amount of discretion and flexibility is intended to be allowable for each Transmission Owner in their respective proximity criteria to document, establish, and demonstrate from a technical basis that various aspects of proximity for their Transmission station(s) or Transmission substation(s) either are or are not appropriate to consider in their risk assessments.~~

The drafting team choose 1500 feet or 457 meters (the shortest distance, measured substation fence line to substation fence line) in Requirement R2 is based on the study from America's Cyber Defense Agency developed in partnership with the Federal Bureau of Investigation (FBI). The Department of Homeland Security (DHS)-Department of Justice (DOJ) Bomb Threat Stand-Off Card is a quick reference guide providing recommended evacuation and shelter-in-place distances for various types and sizes of Improvised Explosive Devices (IED).[1]

Accurate simulation of the event was deemed a priority of the Drafting Team (DT). The DT felt that ownership of proximate substations, as identified in Requirement R2, was irrelevant to Bulk Electric System (BES) impact.

Rationale for Requirement R3

Per Requirement R3, each Transmission Owner is required to have a risk assessment methodology, ~~but the SDT intends for each TO to have flexibility to define its own methodology,~~ including the criteria by which analytical results will be examined to identify Transmission station(s) or Transmission substation(s) that if rendered inoperable or damaged as a result of a physical attack could result in instability, uncontrolled separation, or Cascading within an Interconnection. The ~~TO~~Transmission Owner is not required to develop its own methodology and is free to use a methodology developed elsewhere, such as in coordination with neighboring ~~TOs or~~ Transmission Owners or Independent System Operators (ISOs).

Rationale for Requirement R3, Part 3.1

~~TOs~~Transmission Owners should ~~have the flexibility to~~ determine the amount of ~~acceptable~~unacceptable load loss~~, acceptable~~ and generation loss~~, or other measurements of system response~~ when determining the impact of an event to the Transmission system. Criteria for measures such as load loss or generation loss should consider the impact to the Interconnection ~~instead of local impacts~~.

Large loss of generation or load due to the evaluated disturbance~~, as well as consequences of isolating faulted equipment,~~ could result in severe System impacts. The documented risk assessment methodology shall include the amount of ~~acceptable~~unacceptable load loss~~, the amount of acceptable~~ and generation

[1] https://www.cisa.gov/resources-tools/resources/dhs-doj-bomb-threat-stand-card

loss, ~~and post-event response resulting~~that could result in instability, uncontrolled separation, or Cascading within an Interconnection. Conditions and thresholds used for determining critical Transmission station(s) or Transmission substation(s), i.e., those that if rendered inoperable or damaged as a result of a physical attack could result in instability, uncontrolled separation, or Cascading within an Interconnection, should be part of the documented risk assessment methodology.

It is up to the ~~TO~~Transmission Owner to identify post-event measures that can be used to assess the criticality of a Transmission substation or Transmission substation. Suggested measures are listed below. A ~~TO~~Transmission Owner can decide that one or more of the items are not applicable to their location within the interconnection and if any additional items should be included.

~~These thresholds can be treated as proxies for other conditions such as excessive frequency deviation.~~
The following parameters can be used to evaluate the steady-state and/or dynamic analysis:

- Steady state voltages
- Transient voltage response
- Thermal loading of Facilities
- Relay loadability
- Rotor angle stability
- Frequency exceeding generator limits
- Frequency stability
- Acceptable damping of oscillations
- Cascading line tripping
- Steady-state voltage stability

Rationale for Requirement R3, Part 3.2
The performance of both steady state and dynamics simulations is required for all applicable Transmission station(s) and substation(s). Dynamic simulations are required by the ~~SAR after NERC and FERC determined that~~Standard because exclusively performing steady-state simulations ~~alone~~ are insufficient for determining whether the loss of a Transmission station or Transmission substation could result in instability, uncontrolled separation, or Cascading within an Interconnection.

~~Transmission Owners shall develop documented criteria for the conditions listed in Requirement R3, Part 3.1.1, which includes branch thermal exceedance thresholds, bus voltage exceedance thresholds, load loss thresholds, generation loss thresholds, etc.~~
Rationale for Requirement R3, Part 3.3
~~The DT believes that~~A simulation of a ~~fault is~~Fault provides a reasonable assumption for possible events that could impact a single Transmission station or Transmission substation, and for events that could simultaneously impact multiple Transmission stations or Transmission substations.

Rationale for Requirement R3, Part 3.4

The requirement that simulations shall assume the loss of communications and system protection is consistent with the SAR. ~~It is also consistent~~In accordance with the ~~use of~~SAR, the term "inoperable" ~~in the standard.~~includes the total loss of communication and protection equipment at the substation, necessitating delayed clearance from far-end relaying to isolate the event's impacts. Each simulation should also include the removal of all Elements that Protection Systems and other controls are expected to automatically disconnect for the event.

~~**Rationale for Requirement R3, Part 3.4.1**~~

~~The DT believes that the use of delayed or remote clearing times is consistent with the description of a Transmission station or Transmission substation being rendered inoperable by an event that disabled local protection systems.~~

~~**Rationale for Requirement R3, Part 3.4.2**~~

While there are commonly used generic clearing times for remote clearing that are consistent across the industry, actual clearing times can be shorter or longer depending on conditions and design considerations at an individual ~~TO~~Transmission Owner. The difference of a few cycles can have a significant impact on the transient behavior of generating units, therefore, it is required that the risk analysis use actual ~~clearing times~~ or more conservative ~~values~~clearing time.

Rationale for Requirement R4

Joint ownership of Transmission substations and Transmission stations was discussed in the Guidelines and Technical Basis of previous versions of the CIP-014-3 standard, but the needed prescription on this issue was missing from the standard language. Because the CIP-014-4 Risk Assessment Refinement SAR calls for clarification regarding Transmission substations and Transmission stations of differing ownership, this section was ~~moved to its own requirement within~~clarified in Requirement R4.

Rationale for Requirement R5

An objective of the CIP-014-3 Risk Assessment Refinement SAR was to align study periods, frequency of studies and the powerflow models used for the studies. A 36-month periodicity was chosen for the R5 risk assessment to reduce the periodicity options from previous versions of the standard. Additionally, a single study periodicity is more easily aligned with project in-service date considerations and model choices. As called for in Project Scope item 3 of the CIP-014-3 Risk Assessment Refinement SAR, the risk assessment must comply with the methodology developed in R3, so this language was explicitly added to R5.

Transmission Owners shall review and, if necessary, update the list of applicable Transmission station(s) or Transmission substation(s) per Attachment 1 at least once every 36 months. The list of applicable Transmission station(s) or Transmission substation(s) shall include existing or planned to be in service within 36 months Transmission station(s) and Transmission substation(s). The 36-month cycle for updating the list of applicable Transmission station(s) or Transmission substation(s) per Attachment 1 aligns with the annual cycle for performing Planning Assessments per NERC Standard TPL-001. The 36-month risk assessment study cycle aligns with the 36-month planned-to-be-in-service date.

In addition to the performance of the risk assessment using Transmission station(s) and Transmission substation(s) identified in Requirement R1, any proximate Transmission station(s) and Transmission substation(s) identified in Requirement R2 should also be included in the risk assessment. Furthermore, any Transmission station(s) and Transmission substation(s) assessed due to having been identified per Requirement R1 should also be run as part of a proximate Transmission station(s) and Transmission substation(s) group per Requirement R2 if such an identification is made.

Rationale for Requirement R5, Part 5.1

If a Transmission Owner performs a steady state analysis and identifies a Transmission station or substation that, if rendered inoperable or damaged, could result in instability, uncontrolled separation, or Cascading within an Interconnection, then dynamic analysis is not required for that Transmission station or substation. If a Transmission Owner performs a dynamic analysis and identifies a Transmission station or substation that, if rendered inoperable or damaged, could result in instability, uncontrolled separation, or Cascading within an Interconnection, then steady state analysis is not required for that Transmission station or substation.

Rationale for Requirement R5, Part 5.2

The intent of this Requirement is that Transmission Owners do not have to reassess already identified and protected Transmission stations or substations (Requirement R5.3 and Requirements R7 through R10 still apply to those Transmission stations or substations). A new risk assessment will need to be performed if the Transmission owner wishes to determine whether or not a Transmission station or substation can be removed from identification and protection as outlined in Requirement R7.1.

Rationale for Requirement R5, Part 5.3

Identification of Primary Control Centers

: After completing the risk assessment under Requirement R5 and verified under Requirement R6, it is important to additionally identify the primary control center that operationally controls each Transmission station or Transmission substation, that if rendered inoperable or damaged could result in instability, uncontrolled separation, or Cascading within an Interconnection. A primary control center "operationally controls" a Transmission station or Transmission substation when the control center's electronic actions can cause direct physical actions at the identified Transmission station and Transmission substation, such as opening a breaker.

~~**Requirement R6 through Requirement R10 are Requirement R2 through Requirement R6 in CIP-014-3. The Drafting Team did not make any changes to these Requirements. Therefore, the technical rationales are not provided here.**~~

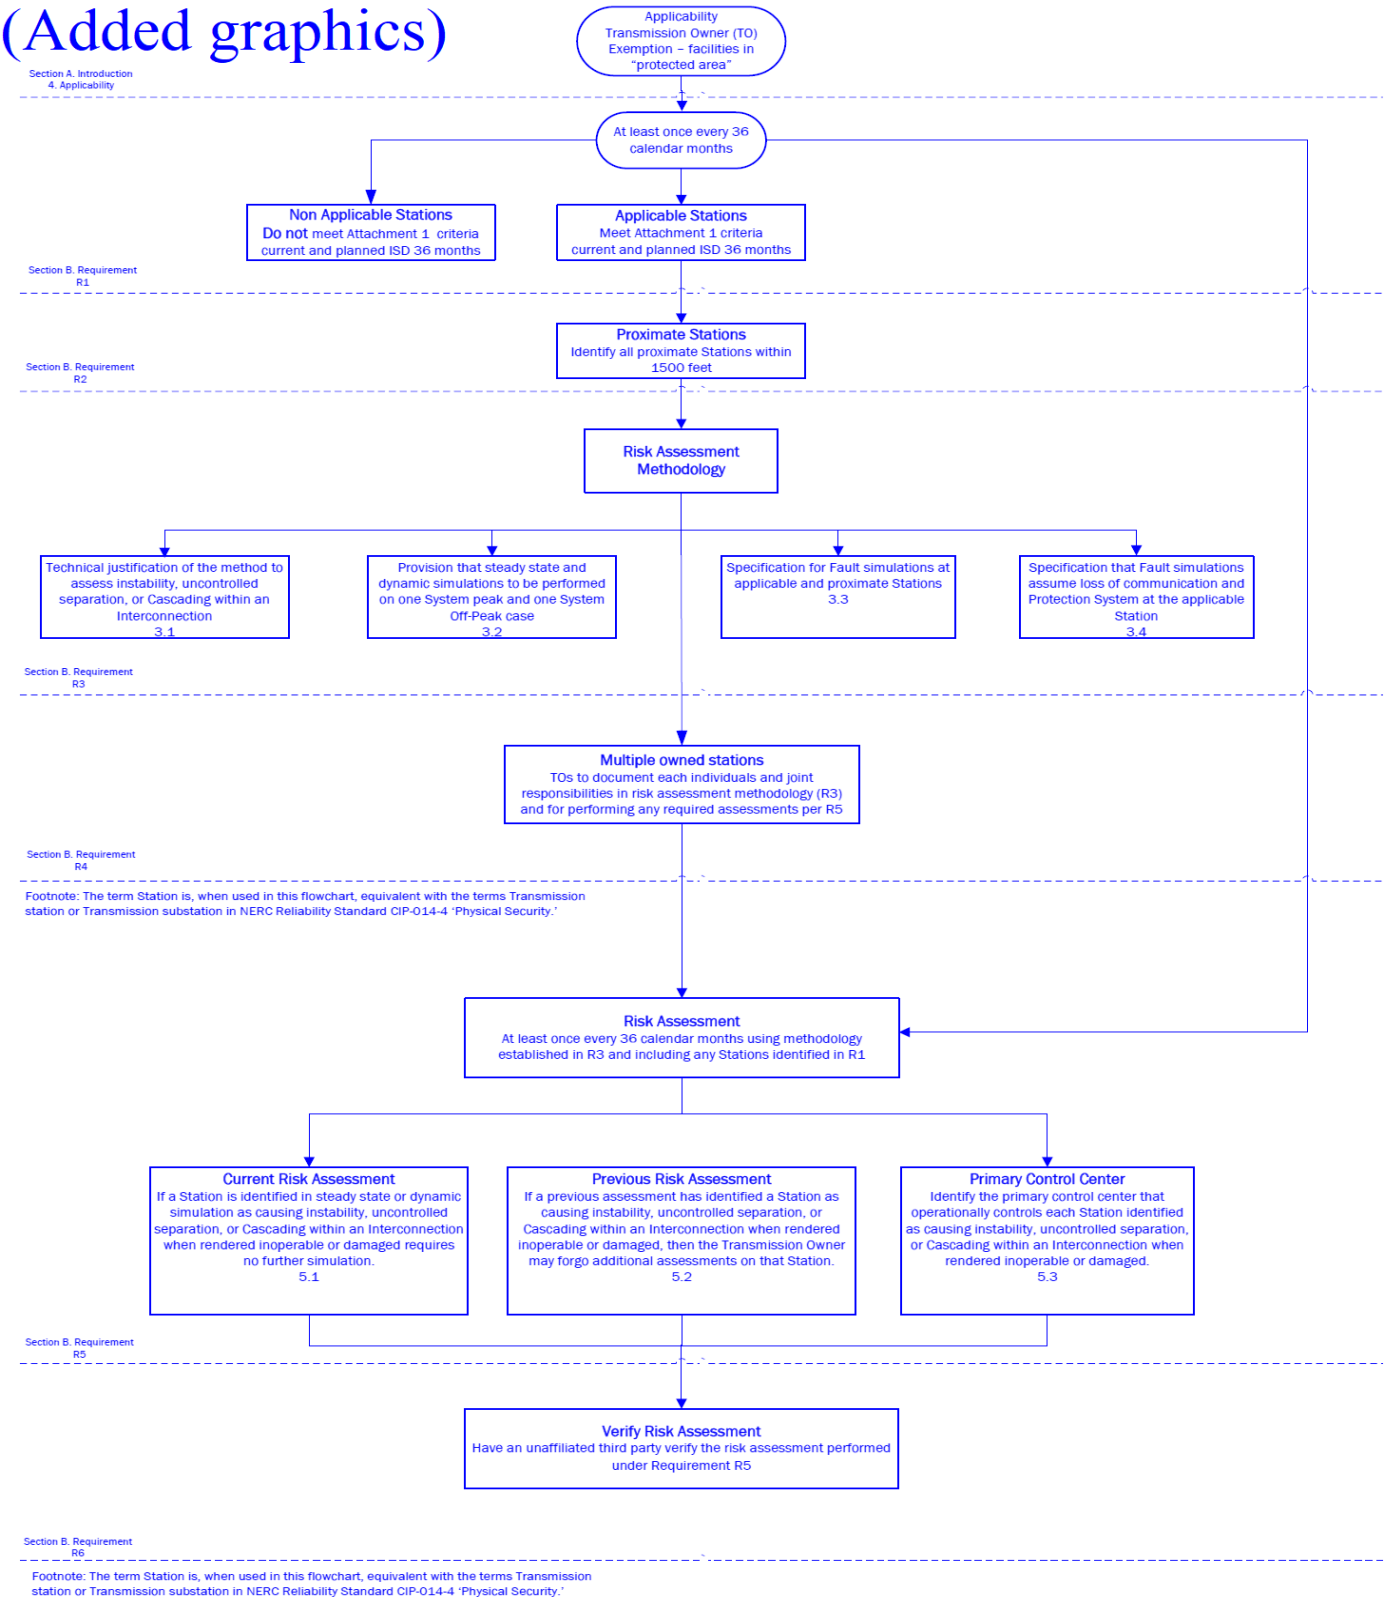
Rationale for Implementation Plan

The Drafting Team has determined that 24 calendar months for the CIP-014-4 implementation plan would allow adequate time for Transmission Owners and Transmission Operators to determine applicability, develop criteria, write or revise methodologies, perform assessments, and procure unaffiliated third parties for risk assessment verification (which some Transmission Owners have performed concurrently with their risk assessment analyses.

CIP-014-4 Flowchart

The flowchart is a concise outline that guides through the steps for completing the risk assessment at least once every 36 calendar months, based on the Applicability in Attachment 1 and Requirements R1-R5.

(Added graphics)



Technical Rationale for Reliability Standard CIP-014-3

This section contains a "cut and paste" of the former Guidelines and Technical Basis (GTB) as-is of from CIP-014-3 standard to preserve any historical references. No modifications have been made.

Requirement R2 (This is Requirement R6 in CIP-014-4)
This requirement specifies verification of the risk assessment performed under Requirement R1 by an entity other than the owner or operator of the Requirement R1 risk assessment.

A verification of the risk assessment by an unaffiliated third party, as specified in Requirement R2, could consist of:

1. Certifying that the Requirement R1 risk assessment considers the Transmission stations and Transmission substations identified in Applicability Section 4.1.1.
2. Review of the model used to conduct the risk assessment to ensure it contains sufficient system topology to identify Transmission stations and Transmission substations that if rendered inoperable or damaged could cause instability, uncontrolled separation, or Cascading within an Interconnection.
3. Review of the Requirement R1 risk assessment methodology.

This requirement provides the flexibility for a Transmission Owner to select from unaffiliated registered and non-registered entities with transmission planning or analysis experience to perform the verification of the Requirement R1 risk assessment. The term unaffiliated means that the selected verifying entity cannot be a corporate affiliate (*i.e.,* the verifying or third party reviewer cannot be an entity that corporately controls, is controlled by or is under common control with, the Transmission Owner). The verifying entity also cannot be a division of the Transmission Owner that operates as a functional unit.

The prohibition on registered entities using a corporate affiliate to conduct the verification, however, does not prohibit a governmental entity (e.g., a city, a municipality, a U.S. federal power marketing agency, or any other political subdivision of U.S. or Canadian federal, state, or provincial governments) from selecting as the verifying entity another governmental entity within the same political subdivision. For instance, a U.S. federal power marketing agency may select as its verifier another U.S. federal agency to conduct its verification so long as the selected entity has transmission planning or analysis experience. Similarly, a Transmission Owner owned by a Canadian province can use a separate agency of that province to perform the verification. The verifying entity, however, must still be a third party and cannot be a division of the registered entity that operates as a functional unit.

Requirement R2 also provides that the "verification may occur concurrent with or after the risk assessment performed under Requirement R1." This provision is designed to provide the Transmission Owner the flexibility to work with the verifying entity throughout (*i.e.,* concurrent with) the risk assessment, which for some Transmission Owners may be more efficient and effective. In other words, a Transmission Owner could collaborate with their unaffiliated verifying entity to perform the risk assessment under Requirement R1 such that both Requirement R1 and Requirement R2 are satisfied

concurrently. The intent of Requirement R2 is to have an entity other than the owner or operator of the facility to be involved in the risk assessment process and have an opportunity to provide input. Accordingly, Requirement R2 is designed to allow entities the discretion to have a two-step process, where the Transmission Owner performs the risk assessment and subsequently has a third party review that assessment, or a one-step process, where the entity collaborates with a third party to perform the risk assessment.

Characteristics to consider in selecting a third party reviewer could include:

- Registered Entity with applicable planning and reliability functions.
- Experience in power system studies and planning.
- The entity's understanding of the MOD standards, TPL standards, and facility ratings as they pertain to planning studies.
- The entity's familiarity with the Interconnection within which the Transmission Owner is located.

With respect to the requirement that Transmission owners develop and implement procedures for protecting confidential and sensitive information, the Transmission Owner could have a method for identifying documents that require confidential treatment. One mechanism for protecting confidential or sensitive information is to prohibit removal of sensitive or confidential information from the Transmission Owner's site. Transmission Owners could include such a prohibition in a non-disclosure agreement with the verifying entity.

A Technical feasibility study is not required in the Requirement R2 documentation of the technical basis for not modifying the identification in accordance with the recommendation.

On the issue of the difference between a verifier in Requirement R2 and a reviewer in Requirement R6, the SDT indicates that the verifier will confirm that the risk assessment was completed in accordance with Requirement R1, including the number of Transmission stations and substations identified, while the reviewer in Requirement R6 is providing expertise on the manner in which the evaluation of threats was conducted in accordance with Requirement R4, and the physical security plan in accordance with Requirement R5. In the latter situation there is no verification of a technical analysis, rather an application of experience and expertise to provide guidance or recommendations, if needed.

Parts 2.4 and 6.4 require the entities to have procedures to protect the confidentiality of sensitive or confidential information. Those procedures may include the following elements:

1. Control and retention of information on site for third party verifiers/reviewers.
2. Only "need to know" employees, etc., get the information.
3. Marking documents as confidential
4. Securely storing and destroying information when no longer needed.

5. Not releasing information outside the entity without, for example, General Counsel sign-off.

Requirement R3 (This is now Requirement R7 in CIP-014-4)
Some Transmission Operators will have obligations under this standard for certain primary control centers. Those obligations, however, are contingent upon a Transmission Owner first completing the risk assessment specified by Requirement R1 and the verification specified by Requirement R2. Requirement R3 is intended to ensure that a Transmission Operator that has operational control of a primary control center identified in Requirement R1 receive notice so that the Transmission Operator may fulfill the rest of the obligations required in Requirements R4 through R6. Since the timing obligations in Requirements R4 through R6 are based upon completion of Requirement R2, the Transmission Owner must also include within the notice the date of completion of Requirement R2. Similarly, the Transmission Owner must notify the Transmission Operator of any removals from identification that result from a subsequent risk assessment under Requirement R1 or as a result of the verification process under Requirement R2.

Requirement R4 (This is now Requirement R8 in CIP-014-4)
This requirement requires owners and operators of facilities identified by the Requirement R1 risk assessment and that are verified under Requirement R2 to conduct an assessment of potential threats and vulnerabilities to those Transmission stations, Transmission substations, and primary control centers using a tailored evaluation process. Threats and vulnerabilities may vary from facility to facility based on any number of factors that include, but are not limited to, location, size, function, existing physical security protections, and attractiveness as a target.

In order to effectively conduct a threat and vulnerability assessment, the asset owner may be the best source to determine specific site vulnerabilities, but current and evolving threats may best be determined by others in the intelligence or law enforcement communities. A number of resources have been identified in the standard, but many others exist and asset owners are not limited to where they may turn for assistance. Additional resources may include state or local fusion centers, U.S. Department of Homeland Security, Federal Bureau of Investigations (FBI), Public Safety Canada, Royal Canadian Mounted Police, and InfraGard chapters coordinated by the FBI.

The Responsible Entity is required to take a number of factors into account in Parts 4.1 to 4.3 in order to make a risk-based evaluation under Requirement R4.

To assist in determining the current threat for a facility, the prior history of attacks on similarly protected facilities should be considered when assessing probability and likelihood of occurrence at the facility in question.

Resources that may be useful in conducting threat and vulnerability assessments include:

- NERC Security Guideline for the Electricity Sector: Physical Security.
- NERC Security Guideline: Physical Security Response.

- ASIS International General Risk Assessment Guidelines.
- ASIS International Facilities Physical Security Measure Guideline.
- ASIS International Security Management Standard: Physical Asset Protection.
- Whole Building Design Guide - Threat/Vulnerability Assessments.

Requirement R5 (This is now Requirement R9 in CIP-014-4)
This requirement specifies development and implementation of a security plan(s) designed to protect against attacks to the facilities identified in Requirement R1 based on the assessment performed under Requirement R4.

Requirement R5 specifies the following attributes for the physical security plan:

- *Resiliency or security measures designed collectively to deter, detect, delay, assess, communicate, and respond to potential physical threats and vulnerabilities identified during the evaluation conducted in Requirement R4.*

  Resiliency may include, among other things:

  a. System topology changes,

  b. Spare equipment,

  c. Construction of a new Transmission station or Transmission substation.

  While most security measures will work together to collectively harden the entire site, some may be allocated to protect specific critical components. For example, if protection from gunfire is considered necessary, the entity may only install ballistic protection for critical components, not the entire site.

- *Law enforcement contact and coordination information.*

  Examples of such information may be posting 9-1-1 for emergency calls and providing substation safety and familiarization training for local and federal law enforcement, fire department, and Emergency Medical Services.

- *A timeline for executing the physical security enhancements and modifications specified in the physical security plan.*

  Entities have the flexibility to prioritize the implementation of the various resiliency or security enhancements and modifications in their security plan according to risk, resources, or other factors. The requirement to include a timeline in the physical security plan for executing the actual physical security enhancements and modifications does not also require that the enhancements and modifications be completed within 120 days. The actual timeline may extend beyond the 120 days, depending on the amount of work to be completed.

- *Provisions to evaluate evolving physical threats, and their corresponding security measures, to the Transmission station(s), Transmission substation(s), or primary control center(s).*

A registered entity's physical security plan should include processes and responsibilities for obtaining and handling alerts, intelligence, and threat warnings from various sources. Some of these sources could include the ERO, ES-ISAC, and US and/or Canadian federal agencies. This information should be used to reevaluate or consider changes in the security plan and corresponding security measures of the security plan found in R5.

Incremental changes made to the physical security plan prior to the next required third party review do not require additional third party reviews.

Requirement R6 (This is now Requirement R10 in CIP-014-4)

This requirement specifies review by an entity other than the Transmission Owner or Transmission Operator with appropriate expertise for the evaluation performed according to Requirement R4 and the security plan(s) developed according to Requirement R5. As with Requirement R2, the term unaffiliated means that the selected third party reviewer cannot be a corporate affiliate (*i.e.,* the third party reviewer cannot be an entity that corporately controls, is controlled by or is under common control with, the Transmission Operator). A third party reviewer also cannot be a division of the Transmission Operator that operates as a functional unit.

As noted in the guidance for Requirement R2, the prohibition on registered entities using a corporate affiliate to conduct the review, however, does not prohibit a governmental entity from selecting as the third party reviewer another governmental entity within the same political subdivision. For instance, a city or municipality may use its local enforcement agency, so long as the local law enforcement agency satisfies the criteria in Requirement R6. The third party reviewer, however, must still be a third party and cannot be a division of the registered entity that operates as a functional unit.

The Responsible Entity can select from several possible entities to perform the review:

- *An entity or organization with electric industry physical security experience and whose review staff has at least one member who holds either a Certified Protection Professional (CPP) or Physical Security Professional (PSP) certification.*

  In selecting CPP and PSP for use in this standard, the SDT believed it was important that if a private entity such as a consulting or security firm was engaged to conduct the third party review, they must tangibly demonstrate competence to conduct the review. This includes electric industry physical security experience and either of the premier security industry certifications sponsored by ASIS International. The ASIS certification program was initiated in 1977, and those that hold the CPP certification are board certified in security management. Those that hold the PSP certification are board certified in physical security.

- *An entity or organization approved by the ERO.*
- *A governmental agency with physical security expertise.*
- *An entity or organization with demonstrated law enforcement, government, or military physical security expertise.*

As with the verification under Requirement R2, Requirement R6 provides that the "review may occur concurrently with or after completion of the evaluation performed under Requirement R4 and the security plan development under Requirement R5." This provision is designed to provide applicable Transmission Owners and Transmission Operators the flexibility to work with the third party reviewer throughout (*i.e.,* concurrent with) the evaluation performed according to Requirement R4 and the security plan(s) developed according to Requirement R5, which for some Responsible Entities may be more efficient and effective. In other words, a Transmission Owner or Transmission Operator could collaborate with their unaffiliated third party reviewer to perform an evaluation of potential threats and vulnerabilities (Requirement R4) and develop a security plan (Requirement R5) to satisfy Requirements R4 through R6 simultaneously. The intent of Requirement R6 is to have an entity other than the owner or operator of the facility to be involved in the Requirement R4 evaluation and the development of the Requirement R5 security plans and have an opportunity to provide input on the evaluation and the security plan. Accordingly, Requirement R6 is designed to allow entities the discretion to have a two-step process, where the Transmission Owner performs the evaluation and develops the security plan itself and then has a third party review that assessment, or a one-step process, where the entity collaborates with a third party to perform the evaluation and develop the security plan.

Rationale for Attachment 1

The DT moved the applicability language from CIP-014-3 to Attachment 1 to make the standard easier to read.

The purpose of Reliability Standard CIP~~-014-4~~-014 is to protect Transmission stations and Transmission substations, and their associated primary control centers~~,~~ that if rendered inoperable or damaged as a result of a physical attack~~,~~ could result in instability, uncontrolled separation, or Cascading within an Interconnection. To properly include those entities that own or operate such Facilities, the Reliability Standard CIP~~-014-4 primarily~~-014 first applies to Transmission Owners that own Transmission Facilities that meet the specific ~~applicability~~ criteria in ~~Attachment 1~~Applicability Section 4.1.1.1 through 4.1.1.4. The Facilities described in ~~Attachment 1~~Applicability Section 4.1.1.1 through 4.1.1.4 mirror those Transmission Facilities that meet the bright line criteria for "Medium Impact" Transmission Facilities under Attachment 1 of Reliability Standard CIP~~-002-5.1a~~002-5.1. Each Transmission Owner that owns Transmission Facilities that meet the criteria in ~~Attachment 1~~Section 4.1.1.1 through 4.1.1.4 is required to perform a risk assessment as specified in Requirement R1 to identify its Transmission stations and Transmission substations, and their associated primary control centers, that if rendered inoperable or damaged as a result of a physical attack could result in instability, uncontrolled separation, or Cascading within an Interconnection. The Standard Drafting Team (SDT) expects this population will be small and that many Transmission Owners that meet the applicability of this standard will not actually identify any such Facilities. Only those Transmission Owners with Transmission stations or Transmission substations identified in the risk assessment (and verified under Requirement R2) have performance obligations under Requirements R3 through R6.

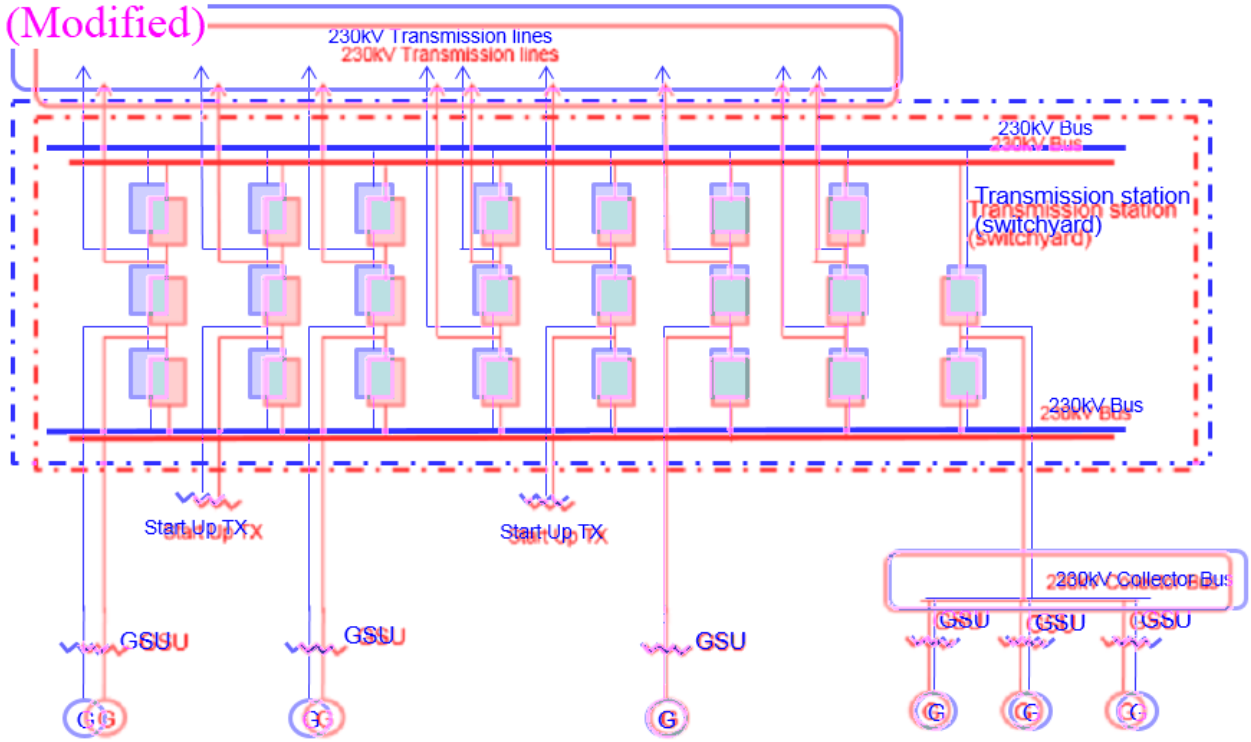
This standard also applies to Transmission Operators. A Transmission Operator's obligations under the standard, however, are only triggered if the Transmission Operator is notified by an applicable Transmission Owner under Requirement ~~R7~~R3 that the Transmission Operator operates a primary control center that operationally controls a Transmission station(s) or Transmission substation(s) identified in the

Requirement ~~R5~~R1 risk assessment. A primary control center operationally controls a Transmission station or Transmission substation when the control center's electronic actions can cause direct physical action at the identified Transmission station or Transmission substation, such as opening a breaker, as opposed to a control center that only has information from the Transmission station or Transmission substation and must coordinate direct action through another entity. Only Transmission Operators who are notified that they have primary control centers under this standard have performance obligations under Requirements ~~R8~~R4 through ~~R10. Primary~~R6. In other words, primary control center~~,~~ for purposes of this Standard~~,~~ is the control center that the Transmission Owner or Transmission Operator, respectively, uses as its primary, permanently-manned site to physically operate a Transmission station or Transmission substation that is identified in Requirement ~~R5~~R1 and verified in Requirement ~~R6~~R2. Control centers that provide back-up capability are not applicable, as they are a form of resiliency and intentionally redundant.

The ~~DT~~SDT considered several options for bright line criteria that could be used to determine applicability and provide an initial threshold that defines the set of Transmission stations and Transmission substations that would meet the directives of the FERC order on physical security (*i.e.*, those that could cause instability, uncontrolled separation, or Cascading within an Interconnection). The SDT determined that ~~continuing to use~~using the criteria for Medium Impact Transmission Facilities in Attachment 1 of CIP-~~002-5.1a~~002-5.1 would provide a conservative threshold for defining which Transmission stations and Transmission substations ~~that~~ must be included in the risk assessment in Requirement ~~R5~~R1 of CIP-~~014-4~~014. Additionally, the ~~DT~~SDT concluded that using ~~CIP002-5.1a~~the CIP-002-5.1 Medium Impact criteria was appropriate because it has been approved by stakeholders, NERC, and FERC, and its use provides a technically sound basis to determine which Transmission Owners should conduct the risk assessment. As described in CIP-~~002-5.1a~~002-5.1, the failure of a Transmission station or Transmission substation that meets the Medium Impact criteria could have the capability to result in exceeding one or more Interconnection Reliability Operating Limits (IROLs). The SDT understands that using this bright line criteria to determine applicability may require some Transmission Owners to perform risk assessments under Requirement R1 that will result in a finding that none of their Transmission stations or Transmission substations would pose a risk of instability, uncontrolled separation, or Cascading within an Interconnection. However, the SDT determined that higher bright lines could not be technically justified to ensure inclusion of all Transmission stations and Transmission substations, and their associated primary control centers that, if rendered inoperable or damaged as a result of a physical attack could result in instability, uncontrolled separation, or Cascading within an Interconnection. Further guidance and technical basis for the bright line criteria for Medium Impact Facilities can be found in the Guidelines and Technical Basis section of CIP-002-5.1.

Additionally, the ~~DT~~SDT determined that it was not necessary to include Generator Operators and Generator Owners in the Reliability Standard. First, Transmission stations or Transmission substations interconnecting generation facilities are considered when determining applicability. Transmission Owners will consider those Transmission stations and Transmission substations that include a Transmission station on the high side of the Generator Step-up transformer (GSU) using ~~Attachment 1, criteria 1~~Applicability Section 4.1.1.1 and ~~2~~4.1.1.2. As an example, a Transmission station or Transmission substation identified as a Transmission Owner facility that interconnects generation will be subject to the Requirement ~~R5~~R1

risk assessment if it operates at 500kV or greater or if it is connected at 200 kV – 499kV to three or more other Transmission stations or Transmission substations and has an "aggregate weighted value" exceeding 3000 according to the table in ~~Attachment 1, criteria 2~~Applicability Section 4.1.1.2. Second, the Transmission analysis or analyses conducted under Requirement ~~R5~~R1 should take into account the impact of the loss of generation connected to applicable Transmission stations or Transmission substations. Additionally, the FERC order does not explicitly mention generation assets and is reasonably understood to focus on the most critical Transmission Facilities. The diagram below shows an example of a station.



~~Figure from CIP-014-3 Guidelines and Technical Basis~~

Also, the ~~DT~~SDT uses the phrase "Transmission ~~station(s)~~stations or Transmission ~~substation(s)~~substations" to recognize the existence of both stations and substations. Many entities in industry consider a substation to be a location with physical borders (i.e.~~,~~ fence, wall, etc.) that contains at least an autotransformer. Locations also exist that do not contain autotransformers, and many entities in industry refer to those locations as stations (switching stations or switchyards). Therefore, the ~~DT~~SDT chose to use both "station" and "substation" to refer to the locations where groups of Transmission Facilities exist.

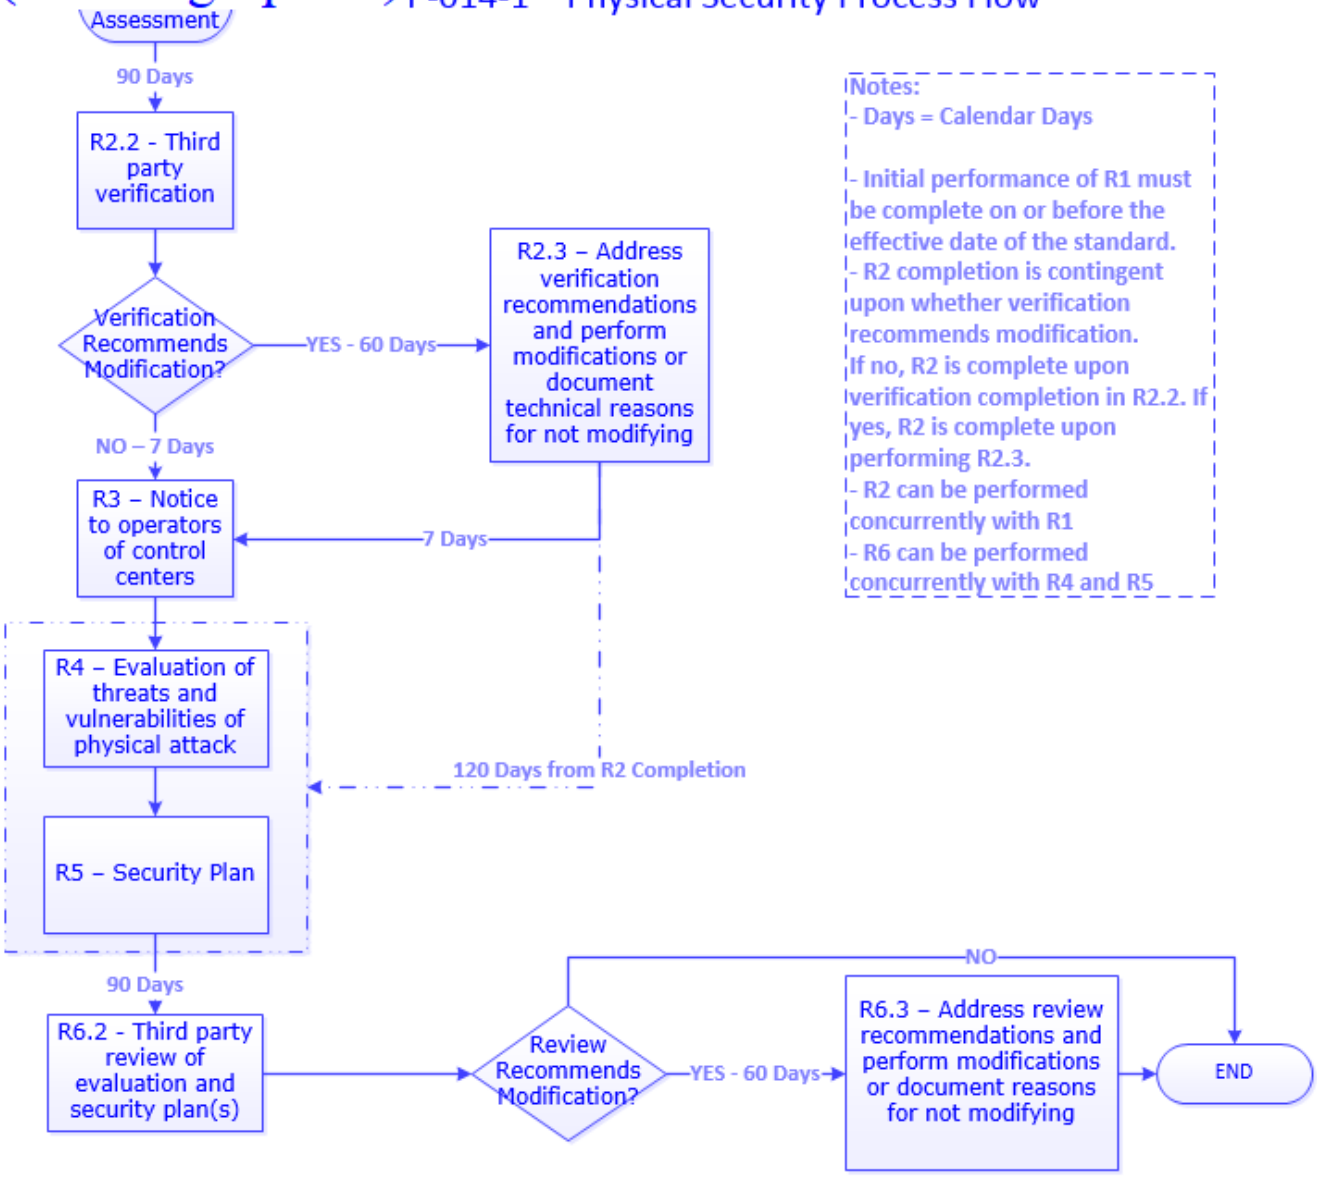
On the issue of joint ownership, the SDT recognizes that this issue is not unique to CIP-014, and expects that the applicable Transmission Owners and Transmission Operators will develop memorandums of understanding, agreements, Coordinated Functional Registrations, or procedures, etc., to designate

responsibilities under CIP-014 when joint ownership is at issue, which is similar to what many entities have completed for other Reliability Standards.

The language contained in the applicability section regarding the collector bus is directly copied from CIP-002-5.1, Attachment 1, and has no additional meaning within the CIP-014 standard.

Timeline

(Added graphics) P-014-1 – Physical Security Process Flow



Rationale

During development of this standard, text boxes were embedded within the standard to explain the rationale for various parts of the standard. Upon BOT approval, the text from the rationale text boxes was moved to this section.

Rationale for Requirement R1 (This is for the old Requirement R1 in CIP-014-3):
This requirement meets the FERC directive from paragraph 6 of its March 7, 2014 order on physical security to perform a risk assessment to identify which facilities if rendered inoperable or damaged could impact an Interconnection through instability, uncontrolled separation, or cascading failures. The requirement is not intended to bring within the scope of the standard a Transmission station or Transmission substation unless the applicable Transmission Owner determines through technical studies and analyses based on objective analysis, technical expertise, operating experience and experienced judgment that the loss of such facility would have a critical impact on the operation of the Interconnection in the event the asset is rendered inoperable or damaged. In the November 20, 2014 Order, FERC reiterated that "only an instability that has a "critical impact on the operation of the interconnection" warrants finding that the facility causing the instability is critical under Requirement R1." The Transmission Owner may determine the criteria for critical impact by considering, among other criteria, any of the following:

- Criteria or methodology used by Transmission Planners or Planning Coordinators in TPL-001-4, Requirement R6
- NERC EOP-004-2 reporting criteria
- Area or magnitude of potential impact

Requirement R1 also meets the FERC directive for periodic reevaluation of the risk assessment by requiring the risk assessment to be performed every 30 months (or 60 months for an entity that has not identified in a previous risk assessment any Transmission stations or Transmission substations that if rendered inoperable or damaged could result in instability, uncontrolled separation, or Cascading within an Interconnection).

After identifying each Transmission station and Transmission substation that meets the criteria in Requirement R1, it is important to additionally identify the primary control center that operationally controls that Transmission station or Transmission substation (*i.e.,* the control center whose electronic actions can cause direct physical actions at the identified Transmission station and Transmission substation, such as opening a breaker, compared to a control center that only has the ability to monitor the Transmission station and Transmission substation and, therefore, must coordinate direct physical action through another entity).

Rationale for Requirement R2 (This is now Requirement R6 in CIP-014-4):
This requirement meets the FERC directive from paragraph 11 in the order on physical security requiring verification by an entity other than the owner or operator of the risk assessment performed under Requirement R1.

This requirement provides the flexibility for a Transmission Owner to select registered and non-registered entities with transmission planning or analysis experience to perform the verification of the Requirement R1 risk assessment. The term "unaffiliated" means that the selected verifying entity cannot be a corporate affiliate (*i.e.*, the verifying entity cannot be an entity that controls, is controlled by, or is under common control with, the Transmission owner). The verifying entity also cannot be a division of the Transmission Owner that operates as a functional unit. The term "unaffiliated" is not intended to prohibit a governmental entity from using another government entity to be a verifier under Requirement R2.

Requirement R2 also provides the Transmission Owner the flexibility to work with the verifying entity throughout the Requirement R1 risk assessment, which for some Transmission Owners may be more efficient and effective. In other words, a Transmission Owner could coordinate with their unaffiliated verifying entity to perform a Requirement R1 risk assessment to satisfy both Requirement R1 and Requirement R2 concurrently.

Planning Coordinator is a functional entity listed in Part 2.1. The Planning Coordinator and Planning Authority are the same entity as shown in the NERC Glossary of Terms Used in NERC Reliability Standards.

Rationale for Requirement R3 (This is now Requirement R7 in CIP-014-4):
Some Transmission Operators will have obligations under this standard for certain primary control centers. Those obligations, however, are contingent upon a Transmission Owner first identifying which Transmission stations and Transmission substations meet the criteria specified by Requirement R1, as verified according to Requirement R2. This requirement is intended to ensure that a Transmission Operator that has operational control of a primary control center identified in Requirement R1, Part 1.2 of a Transmission station or Transmission substation verified according to Requirement R2 receives notice of such identification so that the Transmission Operator may timely fulfill its resulting obligations under Requirements R4 through R6. Since the timing obligations in Requirements R4 through R6 are based upon completion of Requirement R2, the Transmission Owner must also include notice of the date of completion of Requirement R2. Similarly, the Transmission Owner must notify the Transmission Operator of any removals from identification that result from a subsequent risk assessment under Requirement R1 or the verification process under Requirement R2.

Rationale for Requirement R4 (This is now Requirement R8 in CIP-014-4):
This requirement meets the FERC directive from paragraph 8 in the order on physical security that the reliability standard must require tailored evaluation of potential threats and vulnerabilities to facilities identified in Requirement R1 and verified according to Requirement R2. Threats and vulnerabilities may vary from facility to facility based on factors such as the facility's location, size, function, existing protections, and attractiveness of the target. As such, the requirement does not mandate a one-size-fits-all approach but requires entities to account for the unique characteristics of their facilities.

Requirement R4 does not explicitly state when the evaluation of threats and vulnerabilities must occur or be completed. However, Requirement R5 requires that the entity's security plan(s), which is dependent on the Requirement R4 evaluation, must be completed within 120 calendar days following completion of Requirement R2. Thus, an entity has the flexibility when to complete the Requirement R4 evaluation,

provided that it is completed in time to comply with the requirement in Requirement R5 to develop a physical security plan 120 calendar days following completion of Requirement R2.

Rationale for Requirement R5 (This is now Requirement R9 in CIP-014-4):
This requirement meets the FERC directive from paragraph 9 in the order on physical security requiring the development and implementation of a security plan(s) designed to protect against attacks to the facilities identified in Requirement R1 based on the assessment performed under Requirement R4.

Rationale for Requirement R6 (This is now Requirement R10 in CIP-014-4):
This requirement meets the FERC directive from paragraph 11 in the order on physical security requiring review by an entity other than the owner or operator with appropriate expertise of the evaluation performed according to Requirement R4 and the security plan(s) developed according to Requirement R5.

As with the verification required by Requirement R2, Requirement R6 provides Transmission Owners and Transmission Operators the flexibility to work with the third party reviewer throughout the Requirement R4 evaluation and the development of the Requirement R5 security plan(s). This would allow entities to satisfy their obligations under Requirement R6 concurrent with the satisfaction of their obligations under Requirements R4 and R5.

Standards Announcement

Project 2023-06 CIP-014 Risk Assessment Refinement

Formal Comment Period Open through July 21, 2025

Now Available

A 45-day formal comment period for draft three of **CIP-014-4 Physical Security** is open through **8 p.m. Eastern, Monday, July 21, 2025**.

The standard drafting team's considerations of the responses received from the previous comment period are reflected in this draft of the standard.

Reminder Regarding Corporate RBB Memberships

Under the NERC Rules of Procedure, each entity and its affiliates is collectively permitted one voting membership per Registered Ballot Body Segment. Each entity that undergoes a change in corporate structure (such as a merger or acquisition) that results in the entity or affiliated entities having more than the one permitted representative in a particular Segment must withdraw the duplicate membership(s) prior to joining new ballot pools or voting on anything as part of an existing ballot pool. Contact ballotadmin@nerc.net to assist with the removal of any duplicate registrations.

Commenting

Use the Standards Balloting and Commenting System (SBS) to submit comments. An unofficial Word version of the comment form is posted on the project page.

- *Contact NERC IT support directly at https://support.nerc.net/ (Monday – Friday, 8 a.m. - 5 p.m. Eastern) for problems regarding accessing the SBS due to a forgotten password, incorrect credential error messages, or system lock-out.*
- *Passwords expire every **6 months** and must be reset.*
- *The SBS **is not** supported for use on mobile devices.*
- *Please be mindful of ballot and comment period closing dates. We ask to **allow at least 48 hours** for NERC support staff to assist with inquiries. Therefore, it is recommended that users try logging into their SBS accounts **prior to the last day** of a comment/ballot period.*

Next Steps

Additional ballots for the standard and implementation plan, as well as a non-binding poll of the associated Violation Risk Factors and Violation Severity Levels, will be conducted **July 11 – July 21, 2025**.

For information on the Standards Development Process, refer to the Standard Processes Manual.

For more information or assistance, contact Senior Standards Developer, Ben Wu (via email) or at 470-542-6882. Subscribe to this project's observer mailing list by selecting "NERC Email Distribution Lists" from the "Service" drop-down menu and specify “Project 2023-06 CIP-014 Risk Assessment Refinement observer list” in the Description Box.

Standards Announcement
Project 2023-06 CIP-014 Risk Assessment Refinement

Additional Ballots and Non-binding Poll Open through July 21, 2025

Now Available

Additional ballots for **CIP-014-4 Physical Security**, its implementation plan, and non-binding poll of the associated Violation Risk Factors and Violation Severity Levels are open through **8 p.m. Eastern, Monday, July 21, 2025**.

The standard drafting team's considerations of the responses received from the last comment period are reflected in this draft of the standard.

Reminder Regarding Corporate RBB Memberships

Under the NERC Rules of Procedure, each entity and its affiliates is collectively permitted one voting membership per Registered Ballot Body Segment. Each entity that undergoes a change in corporate structure (such as a merger or acquisition) that results in the entity or affiliated entities having more than the one permitted representative in a particular Segment must withdraw the duplicate membership(s) prior to joining new ballot pools or voting on anything as part of an existing ballot pool. Contact ballotadmin@nerc.net to assist with the removal of any duplicate registrations.

Balloting

Members of the ballot pools associated with this project can log in and submit their votes by accessing the Standards Balloting and Commenting System (SBS) here.

Note: Votes cast in previous ballots, will not carry over to additional ballots. It is the responsibility of the registered voter in the ballot pools to place votes again. To ensure a quorum is reached, if you do not want to vote affirmative or negative, cast an abstention.

- *Contact NERC IT support directly at https://support.nerc.net/ (Monday – Friday, 8 a.m. - 5 p.m. Eastern) for problems regarding accessing the SBS due to a forgotten password, incorrect credential error messages, or system lock-out.*
- *Passwords expire every **6 months** and must be reset.*
- *The SBS **is not** supported for use on mobile devices.*
- *Please be mindful of ballot and comment period closing dates. We ask to **allow at least 48 hours** for NERC support staff to assist with inquiries. Therefore, it is recommended that users try logging into their SBS accounts **prior to the last day** of a comment/ballot period.*

Next Steps

The ballot results will be announced and posted on the project page. The drafting team will review all responses received during the comment period and determine the next steps of the project.

For information on the Standards Development Process, refer to the Standard Processes Manual.

Unofficial Comment Form

Project 2023-06 CIP-014 Risk Assessment Refinement

Be aware that this is a public proceeding, and comments are publicly available upon submission. DO NOT include any CEII or otherwise sensitive information in your comments.

Do not use this form for submitting comments. Use the Standards Balloting and Commenting System (SBS) to submit comments on draft three of **CIP-014-4 Physical Security** by **8 p.m. Eastern, Monday, July 21, 2025.**

Additional information is available on the project page. If you have questions, contact Senior Standards Developer, Ben Wu (via email), or at 470-542-6882.

Background Information

Due to an increase in reports of physical attacks on electric substations, the Federal Energy Regulatory Commission (FERC) issued the December 2022 Order in Docket No. RD23-2-000 directing NERC to evaluate the effectiveness of the Physical Security Reliability Standard CIP-014-3 in mitigating the risks to the Bulk-Power System (BPS) associated with physical attacks. In the report filed in response to a FERC directive, NERC staff identified continuing inconsistency in registered entity CIP-014-3 risk assessments to most appropriately identify critical infrastructure. FERC directed NERC to evaluate whether the physical security protection requirements in NERC's Reliability Standards are adequate to address the risks associated with physical attacks on BPS Facilities, including the adequacy of the required risk assessment in CIP-014-3 Requirement R1. In the report, NERC found that CIP-014-3 required revision to assure adequate and consistent approach in evaluating instability as well as the identification of infrastructure critical to the operation of the BPS.

Questions

1. Do you agree with the modifications made in CIP-014-4 with modified Requirement R1 to address the issues identified in the SAR? If you do not agree, please provide your recommendation and, if appropriate, technical or procedural justification.

   ☐ Yes
   ☐ No

   Comments:

2. Do you agree with the modifications made in CIP-014-4 with new Requirement R2 to address the issues identified in the SAR? If you do not agree, please provide your recommendation and, if appropriate, technical or procedural justification.

   ☐ Yes
   ☐ No

   Comments:

3. Do you agree with the modifications made in CIP-014-4 with new Requirement R3 to address the issues identified in the SAR? If you do not agree, please provide your recommendation and, if appropriate, technical or procedural justification.

   ☐ Yes
   ☐ No

   Comments:

4. Do you agree with the modifications made in CIP-014-4 with new Requirement R4 to address the issues identified in the SAR? If you do not agree, please provide your recommendation and, if appropriate, technical or procedural justification.

   ☐ Yes
   ☐ No

   Comments:

5. Do you agree with the modifications made in CIP-014-4 with adding Requirement R5 to address the issues identified in the SAR? If you do not agree, please provide your recommendation and, if appropriate, technical or procedural justification.

   ☐ Yes
   ☐ No

   Comments:

6. Do you agree with the Implementation Plan for CIP-014-4? If you think an alternate timeframe is needed, please propose an alternate implementation plan with a detailed explanation.

   ☐ Yes
   ☐ No

   Comments:

7. Do you believe there are alternatives or more cost-effective options to address the recommendations in CIP-014-4 to address the reliability issue of physical security? If so, please provide your recommendation and, if appropriate, technical, or procedural justification.

   ☐ Yes
   ☐ No

   Comments:

8. Provide any additional comments for the Drafting Team to consider, if desired.

   Comments:

Standards Announcement

Project 2023-06 CIP-014 Risk Assessment Refinement

Formal Comment Period Open through July 21, 2025

Now Available

A 45-day formal comment period for draft three of **CIP-014-4 Physical Security** is open through **8 p.m. Eastern, Monday, July 21, 2025**.

The standard drafting team's considerations of the responses received from the previous comment period are reflected in this draft of the standard.

Reminder Regarding Corporate RBB Memberships

Under the NERC Rules of Procedure, each entity and its affiliates is collectively permitted one voting membership per Registered Ballot Body Segment. Each entity that undergoes a change in corporate structure (such as a merger or acquisition) that results in the entity or affiliated entities having more than the one permitted representative in a particular Segment must withdraw the duplicate membership(s) prior to joining new ballot pools or voting on anything as part of an existing ballot pool. Contact ballotadmin@nerc.net to assist with the removal of any duplicate registrations.

Commenting

Use the Standards Balloting and Commenting System (SBS) to submit comments. An unofficial Word version of the comment form is posted on the project page.

- *Contact NERC IT support directly at https://support.nerc.net/ (Monday – Friday, 8 a.m. - 5 p.m. Eastern) for problems regarding accessing the SBS due to a forgotten password, incorrect credential error messages, or system lock-out.*
- *Passwords expire every **6 months** and must be reset.*
- *The SBS **is not** supported for use on mobile devices.*
- *Please be mindful of ballot and comment period closing dates. We ask to **allow at least 48 hours** for NERC support staff to assist with inquiries. Therefore, it is recommended that users try logging into their SBS accounts **prior to the last day** of a comment/ballot period.*

Next Steps

Additional ballots for the standard and implementation plan, as well as a non-binding poll of the associated Violation Risk Factors and Violation Severity Levels, will be conducted **July 11 – July 21, 2025**.

For information on the Standards Development Process, refer to the Standard Processes Manual.

For more information or assistance, contact Senior Standards Developer, Ben Wu (via email) or at 470-542-6882. Subscribe to this project's observer mailing list by selecting "NERC Email Distribution Lists" from the "Service" drop-down menu and specify “Project 2023-06 CIP-014 Risk Assessment Refinement observer list” in the Description Box.

Comment Report

Project Name:	2023-06 CIP-014 Risk Assessment Refinement | Draft 3
Comment Period Start Date:	6/6/2025
Comment Period End Date:	7/21/2025
Associated Ballots:	Project 2023-06 CIP-014 Risk Assessment Refinement CIP-014-4 AB 3 ST Project 2023-06 CIP-014 Risk Assessment Refinement Implementation Plan AB 3 OT

There were 74 sets of responses, including comments from approximately 160 different people from approximately 98 companies representing 8 of the Industry Segments as shown in the table on the following pages.

Questions

1. Do you agree with the modifications made in CIP-014-4 with modified Requirement R1 to address the issues identified in the SAR? If you do not agree, please provide your recommendation and, if appropriate, technical or procedural justification.

2. Do you agree with the modifications made in CIP-014-4 with new Requirement R2 to address the issues identified in the SAR? If you do not agree, please provide your recommendation and, if appropriate, technical or procedural justification.

3. Do you agree with the modifications made in CIP-014-4 with new Requirement R3 to address the issues identified in the SAR? If you do not agree, please provide your recommendation and, if appropriate, technical or procedural justification.

4. Do you agree with the modifications made in CIP-014-4 with new Requirement R4 to address the issues identified in the SAR? If you do not agree, please provide your recommendation and, if appropriate, technical or procedural justification.

5. Do you agree with the modifications made in CIP-014-4 with adding Requirement R5 to address the issues identified in the SAR? If you do not agree, please provide your recommendation and, if appropriate, technical or procedural justification.

6. Do you agree with the Implementation Plan for CIP-014-4? If you think an alternate timeframe is needed, please propose an alternate implementation plan with a detailed explanation.

7. Do you believe there are alternatives or more cost-effective options to address the recommendations in CIP-014-4 to address the reliability issue of physical security? If so, please provide your recommendation and, if appropriate, technical, or procedural justification.

8. Provide any additional comments for the Drafting Team to consider, if desired.

Nikki Carson-Marquis - Nikki Carson-Marquis On Behalf of: Theresa Allard, Minnkota Power Cooperative Inc., 1; - Nikki Carson-Marquis

Answer	No
Document Name	

Comment

MPC continues to strongly disagree with the use of a 36-month timeframe for utilities who have not previously identified stations or substations as applicable. Increasing the study frequency from every 60 months to every 36 months increases the study burden and cost for utilities without applicable Transmission station(s) or substation(s) while providing no documented benefit to reliability of the BES. MPC proposes to retain the every 60 month requirement for entities that have not identified applicable assets, and include Transmission station(s) and Transmission substation(s) planned to be in service within 60 calendar months. Please see MPC's response to Question 5 for more discussion.

Comment

Question for the SDT: Considering the Measure 1 verbiage ("evidence may include, but are not limited to, dated written or electronic documentation of the Transmission station(s) and Transmission substation(s) (existing and those planned to be in service within 36 calendar months) that meet any of the criteria in Attachment 1."), what action is needed to demonstrate compliance with respect to "identifying" applicable stations, and what notification(s) is needed? Our observation is that the Req #1 verbiage and the Measure 1 verbiage do not align.

Additionally, we observe that the term "applicable" station is introduced in Req# 1 and is used throughout the standard. The term "proximate" station is introduced in Req #2 and is referred to in Reqs 3.3 and 5. Based on this revision to the standard, these are two distinct sets of stations (applicable and proximate). We observe that for a few requirements / sub-requirements, there may be a possible gap or point of confusion as to whether a proximate station needs to meet the requirement / sub-requirement.

As a general comment, we recommend that the specific use of both of these terms be reviewed in fine detail to ensure no that there will no confusion as to whether a requirement pertains to an applicable station, a proximate station, or to both.

Comment	
We do not support the change from 60 months (with no previous applicable substation) to 36 months as there appears to be no technical basis that supports this change. This timeframe causes the Transmission Owner (TO) to enter an unknown state of compliance with CIP-014 if they are on Years 4-5 from the previous 60-month Requirement. The current state of the risk assessment requirements is subjective and TO's should not be forced to perform subjective study efforts on a more frequent basis which only pulls important resources in directions that provide no value to the industry. Further, most significant EHV expansion projects which would actually change the previous base case assumptions do not occur every 36 months and are more in line with 60-month construction periods.

Lucinda Bradshaw - Lucinda Bradshaw On Behalf of: Byron Booker, Oncor Electric Delivery, 1; - Lucinda Bradshaw

Answer	No
Document Name	

Comment

Oncor appreciates that the ambiguous sub-requirements have been removed from Requirement R2, but ambiguity remains in the proposed revised Requirement R2. As a result, Oncor does not fully agree with the modifications made in new Requirement R2.

Oncor's previous comment on revised Requirement R2 requested clarification as to what voltage classes are applicable for proximate Transmission stations and Transmission substations. In the Drafting Team's response, the Drafting Team clarified that proximate Transmission stations and Transmission substations should only be considered if they are part of the Bulk Electric System (operated at 100 kV or higher). At no point is this clarified in the language of the revised Standard. Because the Standard currently only identifies an exclusion for voltages below 200 kV, Oncor recommends CIP-014-4 Requirement R2 be clarified by adding a statement that proximate Transmission stations and Transmission substations only

require consideration if they are part of the Bulk Electric System. Oncor proposes that the following sentence be added to the end of the existing proposed revised Requirement 2: "***Transmission Owners only need to identify proximate Transmission station(s) and Transmission substation(s) that are part of the Bulk Electric System.***"

Oncor also previously commented on the burdensome task of coordination with other parties to track Transmission stations and Transmission substations that are owned by other parties to determine if any stations are within the specified distance threshold. The Drafting Team clarified that there is no need to coordinate with another entity; rather, the Transmission Owner (TO) may use "common public access tools" to identify proximate Transmission stations and Transmission substations. While the use of such tools (*e.g.*, GIS data) may alleviate coordination burdens, it introduces new burdens on TOs to manually review each and every applicable Transmission station and Transmission substation for nearby stations. Oncor has three additional concerns that should be noted related to the use of GIS data:

· GIS data for an area can be low resolution, limited, or entirely unavailable.

· Another complication that could arise is that TOs may unknowingly use GIS data that is out-of-date and no longer representative of the subject area. For example, if a TO used the most recent imagery available from Google Earth to perform its review of an area in 2025, and that imagery was created in 2023, then that imagery would not include any nearby Transmission stations that were built in 2024. Then the TO's review performed in 2025 would not include any proximate stations built in 2024.

· Even if a TO uses current year GIS data in an effort to identify proximate Transmission stations and Transmission substations, this still would not allow the TO to identify planned but not completed proximate stations. For example, a TO could use GIS data to identify proximate stations in 2025, but if in 2026 a new proximate station was built, then the proximate station built in 2026 would not be accounted for in the 2025 review.

We do not agree with the changes to R2 as currently written. The use of the term "identify" is unclear, it's not obvious whether this requires documentation or ongoing tracking. There's also no voltage threshold provided, adding a voltage threshold could provide more clarity and keep from including stations that aren't relevant from a security perspective. It is also uncertain what is expected once these substations are identified, particularly if they are owned by another entity.

ITC supports the distance of 1500 feet or 457 meters (the shortest distance, measured substation fence line to substation fence line) selected by the drafting team for proximate Transmission station(s) and Transmission substation(s). However, we are concerned Transmission stations and Transmission substations owned by other entities who CIP-014 may or may not be applicable cannot be compelled to provide the information necessary for entities to comply with CIP-014. Further, while GIS tools can identify stations and substations within the specified proximity, it can be difficult to determine whose station they might be and if they are Transmission station(s) or Transmission substation(s)

ITC suggests narrowing the scope to existing BES Transmission station(s) and BES Transmission substation(s) which are owned by the applicable entity.

R2. Each Transmission Owner shall identify proximate **BES** Transmission station(s) and **BES** Transmission substation(s), owned by the applicable TO, within 1500 feet or 457 meters (the shortest distance, measured substation fence line to substation fence line) of an applicable Transmission station or Transmission substation identified in Requirement R1. [Violation Risk Factor: Medium; Time-Horizon: Long-term Planning]

ITC asks the drafting team to consider adding content to the technical rationale describing ways that an entity can be confident of to demonstrate compliance that are not cost prohibitive for companies with facilities in numerous states. Concern is identifying stations not owned by the TO.

The use of the word “proximate” appears to imply an estimation and leaves the determination of what constitutes a nearby Transmission Substation or Station to the discretion of the entity. However, the requirement specifies a precise distance and a method for measuring that distance. NPCC RSC recommends removing the word “proximate.” NPCC RSC also recommends modifying Requirement R2 to read: “Transmission station(s) and Transmission substation(s) identified in CIP-002.” If the intent is to conduct a separate process or analysis to identify applicable assets, that assessment should be performed under CIP-002.

Comment	

We do not agree with using proximity as the only triggering factor for this requirement. An entity (particularly urban utilities) may have transmission stations within 1,500 feet of each other but due to their design (i.e., Open Air vs. Enclosed) the impact of a possible physical attack can be mitigated. It would be impossible to have simultaneous faults at the applicable and proximate station under those circumstances. An example of a revised R2:

R2: Each Transmission Owner shall identify proximate open-air Transmission station(s) and Transmission substation(s), irrespective of ownership, within 1500 feet or 457 meters (the shortest distance, measured substation fence line to substation fence line) of an applicable Transmission station or Transmission substation identified in Requirement R1

Additionally, the technical rationale does not include the name or a link to the study that was the basis for this modified requirement; knowing what specific reliability concerns this modified requirement was intended to mitigate would be helpful.

Comment

We disagree with the 1,500 feet requirement as there is no clear definition of the initiating disturbance. The initiating event could be anything from gunshots up to a “smoking crater” scenario and the impacts to adjacent substations could range from minimal or moderate damage to severe damage, all of which are undefined in this standard. The Physical Security standard was proposed to enhance the physical security at critical BES substations, but there are no enhanced physical security defense mechanisms which can protect a substation from a missile attack which is the only feasible way to result in a “Smoking Crater” scenario at multiple substations. So, the attack scenarios need to be plausible so that realistic physical security enhancements can be deployed to facilitate improvements in the security posture at critical BES substations. The “Smoking Crater” scenario is not plausible and thus the 1,500 feet impact zone is not justified. Assuming a simultaneous 3-Phase fault on every element in a large substation along with each and every element of an adjacent substation within 1,500 feet cannot be technically justified and therefore cannot be a requirement for the risk

assessment. Experienced TOs know through prior disturbance analysis events, that 3-phase faults are rare at a single point in the entire transmission system, so they should not be assumed to occur at one exact point in time on multiple elements at multiple substations covering large distances.

SRP recommends establishing clearer criteria for determining station applicability. As currently written, the requirement is open to interpretation, specifically regarding which voltage levels and which stations are included under the phrase " of any applicable Transmission station." To avoid ambiguity, we recommend clarifying section 4 or specifying that Requirement R2 applies only to Transmission stations or Transmission substations identified by the Transmission Owner through the risk assessment process described in Requirement R1, in accordance with the Applicability criteria outlined in Attachment 1.

Comment

Clarification is needed that adjacent stations only refers to BES stations. Additionally, the 1500ft distance is unnecessarily perscriptive and should be provided only as guidance. Each entity's physical security experts, in concert with 3rd party evaluators, should have latitude to determine the apporpriate distance to consider givent the unique characteristics and vulnerabilities of each site under evalution.

Jodi Yeary - AEP - 3	
Answer	No
Document Name	
Comment	

AEP is supportive of the modifications. However, specifying fence line to fence line is too prescriptive. Many utilities already have systems of record for station coordinates/addresses that are currently or can be used for distance calculations that are not based on fence boundaries. This prescriptive boundary language adds unnecessary compliance burden and possibly requires TOs to create and maintain a new system of record. AEP's preference is to leave boundary definitions to the TOs discretion as long as their methodology for distance calculation is documented.

Answer	No
Document Name	
Comment	

Black Hills Corporation agrees with EEI regarding the new requirements in R2. We support the distance of 1500 feet measured between the closest sections of substation fencing. However, we have concerns about non-registered entities not being compelled to provide information necessary for registered entities to comply with CIP-014-4. Black Hills Corporation agrees with EEI's recommendation of adding the 'BES' verbiage to Transmission

station and Transmission substation to reduce the scope to entities who would be compelled to comply with CIP-014-4. We also agree with the suggestion to add acceptable ways to measure the distance between substations into the technical rationale for clarity.

Isidoro Behar - Long Island Power Authority - 1

Answer	No
Document Name	

Comment

PSEG Long Island Agrees with the majority of changes provided to R2, including the fence line to fence line criteria, revision to distance (1500ft, and removal of criteria previously in 2.1 and 2.2.

One improvement would be to include language, to prevent ambiguity of responsibility. Suggested change: "***Each Transmission owner with applicable Transmission station(s) and Transmission substation(s) identified in Requirement R1 shall***…..". This language aims to prevent adjacent transmission owners whose facilities do not meet the criteria identified in R1 from speculating about the proximate facilities, and future projects, of adjacent transmission owners. It's reasonable that the TO's facility who meets the criteria under R1 could identify electrical transmission facilities within the 1500ft distance outlined in R2.

Bob Cardle - Bob Cardle On Behalf of: Marco Rios, Pacific Gas and Electric Company, 3, 1, 5; Sandra Ellis, Pacific Gas and Electric Company, 3, 1, 5; Tyler Brun, Pacific Gas and Electric Company, 3, 1, 5; - Bob Cardle

Answer	No
Document Name	

Comment

1) PGAE does not agree with the language of "irrespective of ownership". PGAE does not have authority to evaluate other entities facilities and potentially create a document of record that other entities could be held accountable. Also, PGAE does not want a compliance obligation tied to an entity that we have to authority over.

2) Reviewing the bomb threat standoff card, the reference to 1700 feet of standoff appears to be a reference to the mandatory evacuation distance for a 40 foot Semi-Truck trailer filled with 60,000 pounds of explosives. PGAE does not agree that Vehicle-Borne Improvised Explosive Device (VBIED) are a prevalent enough attack vector that private utilities should be required to protect against them. There are far greater immediate threats.

3) "Proximate Station" Screen-1500 ft Fence-to-Fence Criterion (R2) - The new requirement to list any transmission station located within 1500 ft of a candidate facility acknowledges the risk of multi station, single attack scenarios, yet the fixed distance appears arbitrary. To prevent over or under inclusion, especially in dense urban corridors, PGAE recommends that NERC cite the threat analysis that produced the 1500 ft requirement and allow

entities to justify an alternative distance if a quantified risk assessment shows equivalent or better coverage. This added clarity will reduce regional interpretation disputes and avoid unnecessary modelling effort. This requirement also presents substantial implementation challenges related to inter-utility coordination. Assessing the physical security implications of an attack on a neighboring utility's substation, particularly when there is no existing joint ownership or operational agreement, will necessitate new formal data-sharing protocols and coordination mechanisms. This could lead to administrative complexities, delays in risk assessments, and potential disputes over sensitive information sharing. We urge NERC to provide specific guidance or a recommended template for inter-utility agreements to facilitate this critical coordination.

NB Power supports NPCCs comments:

"The use of the word “proximate” appears to imply an estimation and leaves the determination of what constitutes a nearby Transmission Substation or Station to the discretion of the entity. However, the requirement specifies a precise distance and a method for measuring that distance. NPCC RSC recommends removing the word “proximate.”
NPCC RSC also recommends modifying Requirement R2 to read:
“Transmission station(s) and Transmission substation(s) identified in CIP-002.”
If the intent is to conduct a separate process or analysis to identify applicable assets, that assessment should be performed under CIP-002."

FirstEnergy supports EEI Comments which state:

EEI supports the distance of 1500 feet or 457 meters (the shortest distance, measured substation fence line to substation fence line) selected by the drafting team for proximate Transmission station(s) and Transmission substation(s). However, we are concerned Transmission stations and Transmission substations owned by non-registered entities are not compelled to provide the information necessary for entities to comply with CIP-014.

Further, while GIS tools can identify stations and substations within the specified proximity, it can be difficult to determine if they are Transmission station(s) or Transmission substation(s).

EEI suggests narrowing the scope to BES Transmission station(s) and BES Transmission substation(s) which are owned by registered entities who would be compelled to share CIP-014 related information.

R2. Each Transmission Owner shall identify proximate **BES** Transmission station(s) and **BES** Transmission substation(s), irrespective of ownership, within 1500 feet or 457 meters (the shortest distance, measured substation fence line to substation fence line) of an applicable Transmission station or Transmission substation identified in Requirement R1. [Violation Risk Factor: Medium; Time-Horizon: Long-term Planning]

EEI asks the drafting team to consider adding content to the technical rationale describing ways that an entity may choose to accurately measure distances and demonstrate compliance. For instance, Google Earth measurements, leveraging internal personnel, hiring a surveying company etc.

Comment

The technical rationale is not clear for defining the hard limit of 1500 feet as the shortest distance between two substations based on the information presented in a reference guide developed to protect people from a bomb threat, as this is not the only possible hazard addressed by CIP-014. After further review Manitoba Hydro believes the previous criteria in draft-2 are very clear and provide some flexibility for TOs to develop their own proximity criteria.

Such guidelines developed by America's Cyber Defense Agency can be referenced as guideline documents by entities when developing their criteria, but it is not recommended to bring those recommendations into a NERC standard as hard limits. If the SDT believed there was a reliability gap or a risk in the CIP-014-4-draft-2 (R2), then the SDT could think about adding another sub-requirement for TOs to develop a documented criteria or include a criteria into the TO's risk assessment methodology .

AZPS agrees with comments submitted by EEI on behalf of their members to narrow the scope of proximate Transmission station(s) or Transmission substation(s) to BES Transmission station(s) and Transmission substation(s) which are owned by registered entities. AZPS agrees with EEI comments that it would be appreciated to consider adding more detail to Measurement M2 describing intended evidence that the distance has been accurately measured.

AZPS also agrees with EEI comments that clarification on if a site is identified as part of Requirement R2 and is owned by a different company how that applies to R8-R10.

Tri-State recommends the following:

R2 should exclude Transmission stations or substations that are below 200 kV from being considered proximate Transmission stations or substations. Without this exception, the requirement 3.3.2 that faults on proximate stations be studied would result in faults on low voltage systems being studied, despite the general intention of CIP-014 to exclude low voltage stations.

R2 should permit an exception for stations or substations that are not electrically close despite physical proximity. Substations may be physically close, but not have any transmission line connecting them, such that they are functionally distant for power flow and transient stability purposes. While the substation may be damaged/removed by the same attack, they would not be impacted by each other's faults and would be cleared separately. In addition, the "proximate" substation in this circumstance will frequently be owned by another entity, such that entities will have to perform studies on systems that are entirely owned by others.

Comment

The rationale for the 1500 feet requirement refers to the DHS-DOJ Bomb Threat Stand-off Card for semi-trailier type threats as justification for including this number in R2. However, the distances on the Stand-off Card are related to the mandated personnel evacuation distances for a variety of bomb threats, not necessarily damage distances for these threats. For instance, it would be recommended to use a number that is based upon historical and/or technical research for damage distance of semi-trailer type bomb threats rather than the guidance for safe personnel evacuation distance when considering which stations may be impacted by a bombing event.

Additionally, the measurement from substation fence line to substation fence line can present some unrealistic distance scenarios for CIP-014 assessments, especially for substations that share a fence line with another substation and are located within 1500 feet of a third station. There are situations under these conditions where equipment distances may far exceed 1500 feet, which is already a distance determined by evacuation mandates and not by technically-supported damage distances. For instance, a substation may have a large fenced area with power equipment positioned within the fence perimeter in such a way that distances may far exceed 1500 feet from the proposed event blast location to adjacent “proximate” facilities but would still need to be assessed based upon the proposed R2 draft 3 language.

It is recommended to modify this language to be less prescriptive with this distance requirement and instead allow utilities to either:

- Use the provided R2 distance, whether that is the current revision’s 1500 foot requirement or a distance based upon damage distances (Note: It is preferable the distance number be based upon technically-supported damage distances rather than mandatory evacuation distances, as mentioned above.)

OR

- Allow utilities to select their own distance for identifying proximate stations but require utilities to provide rationale within their CIP-014 methodologies and/or assessments for why they selected a different distance threshold or excluded proximate stations from identification.

It is requested that NERC provide additional guidance or DHS/DOJ/CISA resources for damage distances of various bomb threat types in a similar fashion to the stand-off card for evacuation distances. This would allow R2 to address the intent of the SAR by requiring utilities to assess semi-trailer type bomb threats to their power systems while also provide additional assessment flexibility and avoiding additional compliance assessment burden for unreasonable scenarios.

Monika Montez - California ISO - 2 - WECC, Group Name ISO/RTO Council Standards Review Committee (SRC)	
Answer	Yes
Document Name	
Comment	
The ISO/RTO Council (IRC) Standards Review Committee (SRC) recommends that the drafting team should account for the fact that the Transmission Owner might be the only entity that has the information needed to determine which Transmission stations or substations are within 1500 feet or 457 meters of an applicable Transmission station or substation under Requirement R2. Consequently, entities performing unaffiliated third-party verifications under Requirement R6 may not be able to verify that a Transmission Owner has properly identified all Transmission stations or Transmission substations within 1500 feet or 457 meters of applicable stations or substations identified under Requirement R1. As a result, these unaffiliated third parties may need to rely on data provided by the TO when no other data is available, which could undermine the usefulness of unaffiliated third-party verifications.

Although the requirement for proximity is simplified from past versions, it is missing the possibility of 2 non-applicable stations (ex. each station with 3-230 kV lines) that if considered proximate (within 1500 feet), may together meet the Applicability criteria. Such a station pair would be missed out from CIP-14-4 requirement R2, as stated currently. Is this an acceptable risk to the interconnection?

Sean Steffensen - IDACORP - Idaho Power Company - 1

Answer	No
Document Name	

Comment

Idaho Power Company (IPC) recommends the Standard not prescribe a specific second case as a low-load scenario. Instead, IPC suggests the Standard require the second case reflect the system's worst-case conditions outside of the stresses applied in the System peak load case. This case could include scenarios that impose additional or independent stress on the system, such as varying seasonal conditions, path transfers, or different load levels. The specific nature of this case would depend on the system's topology, and system operators would be best positioned to determine what additional stresses should be considered. Additionally, IPC seeks further clarification regarding the term "proximate station" in the context of the requirement: "Faults at both the applicable and proximate Transmission station(s) or Transmission substation(s)." Specifically, IPC requests clarification on whether this requirement implies faults should be evaluated simultaneously across all proximate stations, or if each proximate station should be assessed individually in the same manner as the applicable station.

Ronald Hoover - Bonneville Power Administration - 1,3,5,6 - WECC	
Answer	No
Document Name	
Comment	

Requirement 3 creates confusion in situations where two or more substations in close proximity have different owners or joint ownership. It is unclear which entity should apply a fault, especially if the owner identified it under R1 and another entity identified it as proximate. It should be sufficient to apply a fault at the entity's own applicable substation and then take the outage of both the applicable and proximate substations. There would be no need for duplicate fault studies, yet notifications to other entities are not required until R7 is reached.

BPA believes Transmission Owners would have difficulties obtaining and validating information required for proximate Transmission stations or substations. BPA recommends adding language to facilitate coordination among varying entities to ensure data can be received and validated.

R3.4 contains a reference to Part 3.3.2, but there is no such Part in the current redlines. This seems to result in the omission of proximate substations from R3.4, and it is unclear if this is an intentional omission.

Developing steady-state and dynamic simulation criteria is a planning function and should not be required of a Transmission Owner. The sub-requirements go further into addressing what a transmission planning study should include but applies this requirement incorrectly to the Transmission owner. The intent of R3 is more appropriately applicable to the TPL body of standards. CIP-014 should reference output from a study performed in accordance with a clearly defined TPL requirement for an extreme event involving the loss of an applicable Transmission station(s) or substation(s).

3.1 - The second sentence of R3.1 appears to be deficient. There is no reasonable requirement for the thresholds (e.g., technical justifications). Further, consideration of the thresholds should only be one piece of the analysis, not all of it. R3.3.1 should also take into consideration the stability of the system before the thresholds are met. 3.4 - Consider clear indication of what kind of fault needs to be applied, i.e., a three phase to ground bolted fault or a single line to ground fault. 3.4.2 and 3.4.3 - Consider updating language that actual or more conservative clearing times shall be used and if not available, delayed (remote) clearing times are acceptable.

It's unclear whether the generation or load loss criteria will simply have specific MW thresholds for generation loss and load loss in the overall interconnected system, or define generation and load loss thresholds both inside and outside of a Planning Coordinator area (but within the overall Interconnection). Consideration could be given to adding a net loss criterion in cases where both generation and load are lost. When the loss of generation and load are of the same order there are typically minimal impacts on the Interconnection

1) Quantifying "Unacceptable Loss" and "Conservative Clearing Time" (R3.1 &R3.4) - The phrases "unacceptable generation and load loss" in R3.1 and "actual or more conservative clearing time" in R3.4 are inherently subjective and open to regional interpretations. To promote uniform implementation, PGAE recommends that NERC establish quantitative default benchmarks for generation and load loss thresholds, and a clearing time margin. Including	

such reference values—while still allowing entities to justify alternative criteria based on system characteristics—will align CIP-014-4 with the measurable approach used in the NERC TPL standards and reduce the potential for inconsistent compliance findings across regions.

2) Clarification on R3.4- Assumption of Total Loss of Communication and Protection Systems – PGAE recommends clarifying the required assumptions for the simultaneous loss of "all communication and protection systems" in R3.4. Defining the expected modelling approach, preferably with an example one line and timing table, will allow entities to build studies that are both realistic and comparable, avoiding unnecessary burden while meeting the standard's risk reduction objectives

Isidoro Behar - Long Island Power Authority - 1

Answer	No
Document Name	

Comment

Req 3.4 – This requirement states:

"*A specification that Fault simulations assume the loss of communication and Protection Systems at the applicable Transmission station(s) or Transmission substation(s) prior to or simultaneous with the Fault(s) studied under Requirement R3, Parts 3.3.1 and 3.3.2.*"

It is not clear if the loss of communications and Protection Systems would apply to the proximate station (and thus an affected entity would have to make an assumption). We request clarification that the loss of communications and Protection Systems only applies to the **applicable stations** identified based on Req #1 (and not to the proximate stations identified based on Req #2).

Question for clarification: If the loss of communications and Protection Systems does NOT apply to the proximate stations identified based on Req #2, then is it permissible to assume local high speed protection system clearing times for the fault **at the proximate station?**

Josh Schumacher - Black Hills Corporation - 6, Group Name Black Hills Corporation Segments 1, 3, 5, 6

Answer	No
Document Name	

Comment

Black Hills Corporation agrees with EEI's comments about seeking clarification around the use of numbering vs bullet points in Requirement R3 Part 3.3 and Part 3.4. Generally, bullet points can be considered "OR" requirement and numbered items are treated as "AND" requirements. There are also

references to numbered items that don't exist in the current clean version of the document, for example Part 3.4 references Requirement R3 Parts 3.3.1 and 3.3.2, which do not exist in this version of the draft.

Additionally, we agree with EEI's concerns about Requirements R3 Part 3.1 and how it might create scenarios where entities must rely on another party to provide the information necessary to establish and maintain the unacceptable thresholds for generation and load loss within an Interconnection. We agree with EEI's comments to remove some language from requirement R3 Part 3.1 and include it in the technical rationale on how to establish and maintain thresholds.

Jodi Yeary - AEP - 3

Answer	No
Document Name	

Comment

AEP is supportive of specifying that more than one scenario shall be studied but would like flexibility in choosing what factors are varied between scenarios.

Also the draft currently mixes subrequirements with bullets which should be corrected:

In the clean version of CIP-014-4 that is posted, there are bullet points under Requirement R3 Part 3.3 and 3.4, but Part 3.4 references Requirement R3 Parts 3.3.1 and 3.3.2, which do not exist in this draft. The Redline to Last Posted document includes a Requirement R3 Part 3.3.1 followed by a bullet point, but no Part 3.3.2. The Redline to Last Posted version also includes Requirement R4 Parts 3.4.1-3.4.3 instead of the bullet points that are in the clean version under 3.4.

Dave Krueger - SERC Reliability Corporation - 10	
Answer	No
Document Name	
Comment	
SERC appreciates the ongoing efforts to refine the CIP-014 Risk Assessment portion of the standard. SERC believes that each Interconnection Planning Collaborative should establish the maximum generation and load loss thresholds for its respective Interconnection. Allowing each Transmission Owner to establish their own thresholds creates inconsistency for identifying which events cause instability, uncontrolled separation, or Cascading within an Interconnection. SERC believes that the use of the single word ‘Fault’, does not provide clarity and consistency in the requirement. The fault type should be stated as a 3-phase Fault to align with how Extreme events are studied in TPL-001-5.1.

For R3.3, the use of the term "Fault" opens the door to the usage of less severe faults. We recommend changing "Fault" to "a Fault that will cause the most severe consequences at that substation" to ensure the most serious scenario is studied. The Standard need not specify what fault is to be used in the study, but the Entity would identify what the most serious Fault is and study that.

Jamison Cawley - Nebraska Public Power District - 1	
Answer	No
Document Name	
Comment	
There appears to be no technical basis to support the inclusion of prior outage scenarios involving communication systems and the ability to assume simultaneous loss of the comm system with the disturbance is also an option here which introduces subjectivity to the process. Including prior outage scenarios in the Risk Assessment (RA) could include prior outages of generators, lines, transformers and other substation equipment which adds further ambiguity to the RA process. The requirement to use delayed clearing times cannot be technically justified for certain protection schemes (DCUB) and the TO should have the ability to use their extensive experience in this area versus a requirement to assume delayed clearing times.

Nick Leathers - Nick Leathers On Behalf of: David Jendras Sr, Ameren - Ameren Services, 3, 6, 1; - Nick Leathers	
Answer	No
Document Name	
Comment	
Ameren would like more clarity around R3.3.1 and the bulleted item beneath it. As written, it is not clear whether both items are required or if there is a choice of which item to complete. Requiring peak and off-peak cases will double the number of simulations that need to be performed.

Defining a fixed MW value for generation or load loss should not be required if the assessment does not conclude that it would risk instability, uncontrolled separation or Cascading. This could result in a scenario where costly additional security measures are shifted to the entity and its customers for an event that crossed the MW threshold but did not cause instability or Cascading in the assessment.

Nextera supports comments submitted by EEI: EEI appreciates the drafting team’s revisions to Requirement R3, however, Requirement R3, Part 3.1 still includes load loss and generation loss which is not required by the SAR. EEI proposes the following language: “Technically supported thresholds **methodology** and rationale for determining the amount of acceptable load loss, the amount of acceptable generation loss, post event response, and any additional considerations recognized as resulting in instability, uncontrolled separation, or Cascading within an interconnection **used in the analysis to identify System instability for conditions including Cascading, voltage instability, or uncontrolled islanding**. The technical rationale shall include:” Further, Nextera proposes an addition in R3: Perform CIP-014 assessment on both individual and group of Transmission station and substation that are in the proximity. Identify whether individual or Proximity Transmission station and Transmission substation are not meeting the Risk Assessment methodology documented in R3.

EEI seeks clarification on the drafting team's intention for Requirement R3 Part 3.3 and Part 3.4 sub-requirements. In the clean version of CIP-014-4 that is posted, there are bullet points under Requirement R3 Part 3.3 and 3.4, but Part 3.4 references Requirement R3 Parts 3.3.1 and 3.3.2 which do not exist in this draft. The Redline to Last Posted document includes a Requirement R3 Part 3.3.1 followed by a bullet point, but no Part 3.3.2. The Redline to Last Posted version also includes Requirement R4 Parts 3.4.1-3.4.3 instead of the bullet points that are in the clean version under 3.4. The numbers vs. bullets are important to understand because generally, numbered items are treated as "and" requirements, and bulleted lists can be interpreted as "or" requirements.

Additionally, EEI is concerned about the requirement to specify thresholds identifying unacceptable generation and load loss within an Interconnection in Requirement R3 Part 3.1. In some scenarios entities rely on another party to provide the information necessary to establish and maintain these thresholds. EEI suggests striking the sentence "The criteria shall include, at a minimum, thresholds identifying unacceptable generation and load loss within an Interconnection" from Requirement R3 Part 3.1 and including it in the technical rationale with details on how to establish and maintain the thresholds.

We do not agree with the changes to R3 as currently written. If a proximate substation falls outside our footprint , we may not have access to the necessary data to perform a proper risk assessment or to evaluate simulation results. It may be more appropriate for this type of assessment to be handled at the regional level.

3.1 Thresholds for Unacceptable load or generation loss within an interconnection: It will be helpful if WECC provides thresholds for unacceptable load loss and generation loss that may impact the interconnection. Lack of specific criteria from WECC will lead to inconsistency in CIP-14 assessment methodology among members. 3.3 It will be helpful if standard can clarify if the fault is 3 Phase or single phase. 3.4.2 & 3.4.3 Clearing times: It is not clear if Delayed (remote) clearing times or Actual (more conservative) clearing times shall be used. Does the standard allow both? The technical rationale document for CIP 14-4 (pg. 4) seems to indicate that actual or more conservative clearing times are required. If so, 3.4.2 should be removed.

Jennie Wike - Jennie Wike On Behalf of: John Merrell, Tacoma Public Utilities (Tacoma, WA), 1, 4, 5, 6, 3; - Jennie Wike, Group Name Tacoma Power	
Answer	No
Document Name	

Comment
Tacoma Power is concerned with using bullets for the sub-items in R3.3. Instead of using bullets, these sub-items should be numbered as 3.3.1 and 3.3.2 to ensure that both are required. Bullets are used to indicate an “or” relationship. Additionally, the language in the lead-in statement of R3 should be revised to include proximate stations and substations to ensure it’s clear that both should be considered. Proposed revision to R3: “R3. Each Transmission Owner shall have a documented risk assessment methodology for evaluating the loss of each applicable Transmission station or Transmission substation identified in Requirement R1, **and any associated proximate Transmissions stations or Transmission substations identified in Requirement R2**. The methodology shall include, at a minimum, the following: 3.3. A specification for Fault simulations, including: **3.3.1.** For each applicable Transmission station or Transmission substation listed in accordance with Requirement R1, a Fault at the applicable Transmission station or Transmission substation. **3.3.2.** For each Transmission station or Transmission substation determined in accordance with Requirement R2 as being in proximity to an applicable Transmission station or Transmission substation, Faults at both the applicable and proximate Transmission station(s) or Transmission substation(s).” Tacoma Power recommends swapping the order of R3 and R4. The Requirement R4 actions should occur prior to documenting the methodology. Also, there’s an inconsistency between the CIP-014-4 clean version and redline files. The redline to last approved file shows 3.3.1 and 3.3.2 instead of bullets. The redline to last posted file shows 3.3.1 and a bullet. The clean version has only bullets under R3.3.

MRO NSRF recommends reinstating the option to use more conservative estimates vs. actual clearing times in the last bullet of R3.4. If an Entity wishes to use conservative estimates of clearing times rather than calculate every actual clearing time, an auditor can sample and ask for justification. If the actual clearing time is found to be longer than the estimate the auditor would ask for the study to be re-run with the actual clearing time, which may or may not change whether a Transmission station or substation is identified. Registered Entities should have the latitude to use engineering judgement where they think it is warranted. More importantly, if a conservative estimate of clearing times results in the study identifying a Transmission station or substation, there is no need to re-run the study with actual clearing times. This could save system protection personnel significant time and effort calculating unneeded actual clearing times

While Exelon agrees the modifications in the new Requirement R3 address the issues identified in the SAR, we do suggest the following enhancements.	

The sub-requirement R3.1 minimum requirement for thresholds identifying unacceptable generation and load loss within an Interconnection would benefit from additional clarification and guidance. For example, perhaps data regarding frequency response to loss of generation and loss of load could act as guidance for entities to establish these thresholds. To reduce the burden on smaller TOs of developing an R3 methodology and performing the R5 planning studies, consider providing an option for entities to use the list of transmission stations or substations obtained from the Attachment 1 analysis, as the input to R7 for primary control center determination, and as the input to R8 to begin the physical attack evaluation. Attachment 1 would therefore be an option as the R3 methodology that would then be applied in R5. R4 would still be required. The R6 third party review would be limited to a review of the Attachment 1 analysis.

Lucinda Bradshaw - Lucinda Bradshaw On Behalf of: Byron Booker, Oncor Electric Delivery, 1; - Lucinda Bradshaw

Answer	No
Document Name	

Comment

Oncor appreciates the SDT's response to Oncor's previous comment in the last draft, which affirmed that each TO may prepare its own risk assessment of the subject station and may use its own methodology. Oncor also appreciates the SDT's clarification that, in the event agreement cannot be reached, each TO is able to justify its results using its own supporting evidence.

To ensure this intent of the SDT is clearly conveyed, Oncor believes it would be beneficial to include this clarification directly in Requirement R4 language. Accordingly, Oncor recommends the following addition to Requirement R4:

Each Transmission Owner with applicable Transmission station(s) and Transmission substations(s) identified in Requirement R1 containing Bulk Electric System (BES) Elements owned by multiple Transmission Owners shall coordinate with each appropriate Transmission Owner(s) to determine and document their individual and joint responsibilities for documenting a risk assessment methodology under Requirement R3 and for performing any required risk assessments per Requirement R5. ***In the event that coordination of individual and joint responsibilities cannot be achieved for documenting a risk assessment methodology under Requirement R3 and for performing any required risk assessments per Requirement R5, each Transmission Owner shall document and justify its own risk assessment using its own methodology and evidence.***

ITC suggests either the removal of or the following revision to Requirement R4: R4. Each Transmission Owner with applicable Transmission station(s) and Transmission substation(s) identified in Requirement R1 containing Bulk Electric System (BES) Elements **greater than 200 kV or identified as part of an IROL or essential to meeting an NPIR** owned by multiple Transmission Owners shall coordinate with each appropriate Transmission Owner(s) to determine and document their individual and joint responsibilities for documenting a risk assessment methodology under Requirement R3 and for performing any required risk assessments per Requirement R5. R4 is administrative requiring documentation for all joint stations. Many joint stations have existed for decades where the two entities have an understanding of who is responsible for what parts of compliance. When documentation is being required, many entities legal groups will feel a need to be involved making this both time consuming and costly.

The CIP-014 RA should be limited to the substation equipment that the TO owns. There are different study assumptions and criteria available to different TOs and to attempt to coordinate this on this new 36-month timeframe will only require further resources from multiple TOs who may not be willing to share CEII information in an open forum.

Comment

TVA supports coordination among joint owners as an important goal. However, the proposed language essentially introduces a major coordination burden, and it assumes a level of entity collaboration, timing, and methodological alignment. It also raises a compliance risk for one entity being dependent on the responsiveness and practices of another.

TVA suggests modifying the draft language to provide flexibility and protects compliant TOs from being penalized for other's inaction(s), as follows:

"Each Transmission Owner with applicable Transmission station(s) and Transmission substation(s) identified in Requirement R1 containing Bulk Electric System (BES) Elements owned by multiple Transmission Owners shall coordinate with those each appropriate Transmission Owner(s) to determine and document their individual responsibilities for documenting a risk assessment methodology under Requirement R3 and for performing any required risk assessments per Requirement R5."

Or…

"Each Transmission Owner with applicable Transmission station(s) and Transmission substation(s) identified in Requirement R1 containing Bulk Electric System (BES) Elements owned by multiple Transmission Owners shall coordinate with those each appropriate Transmission Owner(s) to determine and document their individual responsibilities for documenting a risk assessment methodology under Requirement R3 and for performing any required risk assessments per Requirement R5. In cases where agreement is not achieved, each Transmission Owner shall independently assess and document its own responsibilities and the basis for any assumptions regarding joint ownership impacts."

As a general comment, Req# 4 needs to be reviewed in detail to ensure clarity and to ensure clear compliance responsibilities.

Req #4 states:

"Each Transmission Owner with applicable Transmission station(s) and Transmission substation(s) identified in Requirement R1 containing Bulk Electric System (BES) Elements owned by multiple Transmission Owners shall coordinate with each appropriate Transmission Owner(s) to determine and document their individual and joint responsibilities for documenting a risk assessment methodology under Requirement R3 and for performing any required risk assessments per Requirement R5."

Req #4 now requires a Transmission Owner to DOCUMENT which TO is responsible for DOCUMENTING specific portions of the risk assessment methodology (RAM). In the previous version of the standard, it only asked TOs to document who is responsible for PERFORMING the risk assessment methodology, but now it must be explicitly outlined who is responsible for even DOCUMENTING parts of that RAM. We would like to point this out so that the SDT can verify if "documenting" individual and joint responsibilities for "documenting" a risk assessment methodology is part of the intent of this revised requirement.

Based on the Technical Rationale, the inclusion of "BES Elements" appears to reference the addition of jointly owned Transmission stations and Transmission substations in the Applicability section. However, introducing the term "BES Elements" creates confusion by shifting the focus to individual elements rather than the applicable Transmission stations and substations.

Req #4 specifically addresses facilities (BES Elements) with joint ownership to coordinate/collaborate. One improvement would be to include Transmission Owners whose stations have been identified as part of Req #2 to also be included in this requirement to coordinate. The ownership of the applicable and proximate stations may be different, and thus we feel the concept of coordination with respect to Req #2 should apply.

We note that there are various possibilities with respect to ownership and to what stations may be considered applicable versus proximate. It is noted that an applicable station owned by one TO may also be considered a proximate station from the perspective of another TO that owns an adjacent applicable station (and vice versa; a proximate station from the perspective of a TO may also be considered an applicable station by another TO).

FirstEnergy supports EEI comments which state: R4. Each Transmission Owner with applicable Transmission station(s) and Transmission substation(s) identified in Requirement R1 containing Bulk Electric System (BES) Elements **greater than 200 kV or identified as part of an IROL or essential to meeting an NPIR** owned by multiple Transmission Owners shall coordinate with each appropriate Transmission Owner(s) to determine and document their individual and joint responsibilities for documenting a risk assessment methodology under Requirement R3 and for performing any required risk assessments per Requirement R5. EEI also asks the drafting team to consider adding content to the Technical Rationale describing how an entity can prove that they do not have anyone to coordinate with because there are no jointly owned Transmission station(s) or Transmission substation(s).

An auditor may asks a Registered Entity to produce evidence proving a negative, i.e. that one or more subs are solely owned. M4 discusses how to show evidence that coordination with joint owners has been completed, but it would be helpful if the drafting team could provide clarity on what to provide as evidence if no joint owners are identified.

Southern Company agrees with Requirement R4 with the below suggestion for consideration:

The removal of including “documentating a risk assessment methodology under Requirement R3”. This is redundant since any Transmission Owner performing Requirement R5 must have a risk assessment methodology for the stations being assessed per Requirements R1, R2, and R4.

R4.
Each Transmission Owner with applicable Transmission station(s) and Transmission substation(s) identified in Requirement R1 containing Bulk Electric System (BES) Elements owned by multiple Transmission Owners shall coordinate with each appropriate Transmission Owner(s) to determine and document their individual and joint responsibilities for documenting a risk assessment methodology under Requirement R3 and for performing any required risk assessments per Requirement R5.

Response

Ronald Hoover - Bonneville Power Administration - 1,3,5,6 - WECC

Answer	No
Document Name	

Comment

BPA believes R5 is missing a requirement to coordinate in order to ensure data from proximate Transmission stations and sub-stations can be obtained and validated. Without a requirement to coordinate, BPA believes there would be difficulty identifying the Primary Control Center operationally controlling the proximate Transmission stations and sub-stations. BPA also recommends adding language to R5 to clarify how a Registered Entity should address negative responses from proximate substation owners.

Comment

There is no issue with performing a risk assessment every 36 months. However, Transmission Owners are not the appropriate registered entity to conduct planning analyses. Nor are the CIP standards the appropriate place to document planning analysis requirements. Planning studies should be governed within the TPL group of standards.

Comment

FirstEnergy asks for clarification of responsibilities toward R5 - specifically as realted to unregistered DERs and IBRs.

FirstEnergy also supports EEI's comments which state:

EEI suggests the following revisions to Requirement R5.

The revised draft CIP-014-4 Requirement R5 includes a new statement: "If proximate Transmission station(s) and Transmission substation(s) were identified in Requirement R2, they should also be

included in the risk assessment." The word "should" could be interpreted as a recommendation instead of a mandatory requirement.

Additionally, by referring to "proximate Transmission station(s) and Transmission substation(s)… identified in Requirement R2" in Requirement R5, all identified proximate Transmission station(s) and Transmission substation(s) would be subject to Requirements R8-R10, not just those that are applicable.

If it is the intention of the drafting team to require applicable proximate Transmission station(s) and Transmission substation(s) to be included in the Requirement R5 risk assessment, EEI suggests the following:

R5. At least once every 36 calendar months, each Transmission Owner shall perform a risk assessment to identify applicable Transmission station(s) and Transmission substation(s) identified in Requirement R1, that if rendered inoperable or damaged could result in instability, uncontrolled separation, or Cascading within an interconnection, using the methodology established in Requirement R3, including any Transmission station(s) and Transmission substation(s) identified in accordance with Requirement R4.

EEI also asks the drafting team to consider adding information to the technical rationale discussing scenarios where a new risk assessment demonstrates that a substation is no longer applicable to CIP-014, but a previous physical security plan includes security measures with future due dates. The technical rationale could include discussion of actions to take when security measures are no longer required for the de-classified transmission substation(s).

Comment

MPC strongly disagrees with the use of a 36-month timeframe for utilities who have not previously identified any Transmission stations or substations as critical as it will lead to increased study costs with little or no benefit to the reliability of the BES. Instead, MPC proposes retaining the requirement to perform a risk assessment every 60 months for TOs that have not previously identified applicable Transmission stations or substations, and include Transmission station(s) and Transmission substation(s) planned to be in service within 60 calendar months.

SAR objective number 2 states a goal for this project is to “correct any discrepancies between the study period, frequency of study, and the base case(s) a Transmission Owner uses.” This is the basis for the SDT’s justification to change the risk assessment timeframe from 60 months for TOs without applicable Transmission stations or substations to 36 months for all TOs without exception. Further, the Technical Rationale states the change to 36 months was to align the CIP-014 risk assessment with the annual model build time frame of Standard TPL-001. Because the CIP-014 analysis

does not depend on the models built for TPL-001, MPC believes changing the risk assessment time frame to align with the TPL-001 model build process does not provide benefit to the CIP-014 analysis. Additionally, the existing 60 month timeframe for TOs without applicable Transmission station(s)/substation(s) still aligns with the 12-month model build timeframe of the TPL-001 standard.

MPC continues to hold the position that given the very slow pace of construction of new electrical infrastructure due to increased equipment lead times, supply chain constraints, and labor shortages, it is highly unlikely that a modification to an existing non-critical station or substation that would result in the station or substation becoming critical would be planned, designed, and constructed within 36 months. It is equally unlikely that a newly constructed CIP-014 critical (sub)station would be completed within this timeframe. As stations and substations planned to be in service within 24 months of the risk assessment are already required to be included under R1 of CIP-014-3, changing the risk assessment timeframe from 60 months to 36 months is very unlikely to identify new Transmission stations or substations that would not be identified under CIP-014-3.

For utilities who have not identified previously identified (sub)stations as critical, moving the risk assessment timeframe from 60 calendar months to 36 calendar months will result in increased costs due to more frequent risk assessments, with the more frequent assessments having no BES reliability benefit as they have little to no chance of identifying stations or substations as CIP-014 critical that would not already have been under the CIP-014-3.

Comment

In general, we recommend that the wording in the main requirement section of Req #5 be reviewed in detail for clarity.

Requirement #5 states:

"*At least once every 36 calendar months, each Transmission Owner shall perform a risk assessment to identify applicable Transmission station(s) and Transmission substation(s) identified in Requirement R1, that if rendered inoperable or damaged could result in instability, uncontrolled separation, or Cascading within an Interconnection, using the methodology established in Requirement R3, including any Transmission station(s) and Transmission substation(s) identified in accordance with Requirement R4. If proximate Transmission station(s) and Transmission substation(s) were identified in Requirement R2, they should also be included in the risk assessment*."

a) This requirement introduces the concept of "*that if rendered inoperable or damaged*". While the verbiage **"that if rendered inoperable or damaged"** may be introduced within the Technical Rationale, this verbiage is confusing when reading Req #5 – and as such it is recommended to correlate what is meant by "that if rendered inoperable or damaged" within Requirement #3 (or introduce this concept within the Req #3). Requirement #3 mentions "the loss of each applicable Transmission station or Transmission substation identified in Requirement R1" – with no mention or correlation of "loss of each station" to "that if rendered inoperable or damaged".

b) The verbiage states "using the methodology established in Requirement R3, including any Transmission **station(s)** and Transmission **substation(s)** identified in accordance with Requirement R4". However, as written, Req #4 relates to the coordination with respect to "**Bulk Electric System (BES) Elements** owned by multiple Transmission Owners". As written, Req #4 does not identify "stations".

c) The verbiage states “If proximate Transmission station(s) and Transmission substation(s) were identified in Requirement R2, they **should** also be included in the risk assessment.”

This implies that the inclusion of proximate stations in the risk assessment is optional. If this is a requirement, the term “should” should be replaced by “shall”.

d) The verbiage states “If **proximate** Transmission station(s) and Transmission substation(s) were identified in Requirement R2, they **should** also be included in the risk assessment.” This requirement is not clear and needs clarification.

- This wording contradicts with the wording in Req #3 which states: “*Each Transmission Owner shall have a documented risk assessment methodology for evaluating the loss of each **applicable** Transmission station or Transmission substation identified in Requirement R1.*”
- Does this mean that requirements 7 through 10 apply to proximate stations if the fault on the proximate station leads to instability, uncontrolled separation, or Cascading within an Interconnection?
- For proximate stations, it is required to identify them and apply a fault on them. For the risk assessment, what specifically needs to be done for the proximate stations?

e) Please clarify whether, at the end of the 36-month period, the entity is required to have initiated or completed the Risk Assessment. We recommend separating the operational assessment and security assessment into distinct components within the timeline to reduce confusion, rather than referring to both collectively as the “risk assessment.”

Josh Schumacher - Black Hills Corporation - 6, Group Name Black Hills Corporation Segments 1, 3, 5, 6

Answer	No
Document Name	

Comment

Black Hills Corporation agrees with EEI’s recommended changes to the language in Requirement R5. This change makes it clear which proximate Transmission stations and Transmission substations should be included in the scope for all requirements. The current language could cause confusion as to which proximate Transmission station/substations need to be included for each requirement, thus expanding the scope of the standard further than is intended. Black Hills Corporation also agrees with EEI’s suggestion to add information to the technical rationale for scenarios where a risk assessment demonstrates a previously applicable substation no longer is, and what actions to take when security measures are no longer required for a specific substation.

“Rendered inoperable” should be eliminated from this standard. This term has no definition and leads the RE to move toward a requirement to study the “Smoking Crater” scenario. There has been no documented “Smoking Crater” scenario documented on US soil at a BES substation and to force TO’s to develop fault scenarios for an unrealistic event is unreasonable.

Recommend removing “including any Transmission station(s) and Transmission substation(s) identified in accordance with Requirement R4. If proximate Transmission station(s) and Transmission substation(s) were identified in Requirement R2, they should also be included in the risk assessment.” from R5.

Rational for removing:

This language is redundant because the inclusion of proximate substations within the risk assessment methodology is already established by the previous Requirements (R2 and R3.3.2) and therefore will inherently be included in the risk assessment. Adding this to Requirement R5 could potentially add confusion. Proximate substations, irrespective of ownership, must be included in the risk assessments; but Requirement R5 is talking about performing the risk assessment and identifying the applicable stations (owned by the TO performing the Risk Assessment) from Requirement R1 that could result in instability, uncontrolled separation, or Cascading within an Interconnection…

Proximate substations owned by different TOs could have different Methodologies. A proximate substation not owned by the TO performing the risk assessment cannot be identified as “critical – that if rendered inoperable or damaged could result in instability, uncontrolled separation, or Cascading” by that TO, even though the proximate substations will be included within the risk assessment based on Requirements R2 and R3. If this redundant language isn’t removed, it could add confusion around this.

The language pointing back to Requirement R4: “...including any Transmission stations(s) and Transmission substation(s) identified in accordance with Requirement R4.” is also not needed and redundant. It doesn’t add confusion in the way the reference back to proximate substations does, but it is still unnecessary. Requirement R4 talks about coordinating the responsibilities if there are BES Elements owned by multiple TOs within a substation already identified in Requirement R1. **The list of substations identified by Requirement R1 are the “superset” and therefore all that is needed in Requirement R5 is point back to R1** (not R4).

EEI suggests the following revisions to Requirement R5.

The revised draft CIP-014-4 Requirement R5 includes a new statement: “If proximate Transmission station(s) and Transmission substation(s) were identified in Requirement R2, they should also be included in the risk assessment.” EEI suggests removing this sentence because Requirement R5 already requires TOs to perform a risk assessment using the methodology established in Requirement R3, and Requirement R3 part 3.3.2 includes Transmission station(s) and Transmission substation(s) determined in accordance with Requirement R2 as being in proximity to an applicable Transmission station or Transmission substation.

Additionally, including a separate reference to “proximate Transmission station(s) and Transmission substation(s)… identified in Requirement R2” in Requirement R5, could be confused for an expansion in scope because, as written, the reference is to identified proximate Transmission station(s) and Transmission substation(s) in Requirement R2, not those that are identified through the performance of the Requirement R5 risk assessment. The scope of Requirement R5 is important because of its tie to Requirements R8-R10.

EEI suggests the following:

R5. At least once every 36 calendar months, each Transmission Owner shall perform a risk assessment to identify applicable Transmission station(s) and Transmission substation(s) identified in Requirement R1, that if rendered inoperable or damaged could result in instability, uncontrolled separation, or Cascading within an interconnection, using the methodology established in Requirement R3, including any Transmission station(s) and Transmission substation(s) identified in accordance with Requirement R4.

EEI also asks the drafting team to consider adding information to the technical rationale discussing scenarios where a new risk assessment demonstrates that a substation is no longer applicable to CIP-014, but a previous physical security plan includes security measures with future due dates. The technical rationale could include discussion of actions to take when security measures are no longer required for the de-classified transmission substation(s).

Gail Elliott - Gail Elliott On Behalf of: Michael Moltane, International Transmission Company Holdings Corporation, 1; - Gail Elliott

Answer	No
Document Name	

Comment

For 5.1, failure to perform the entirety of the risk assessment could have an TO not completing either the stability of steady state portion of the study. If the third party reviewer identified a mistake in the piece of the study that was completed, they have nothing to verify for the second half of the study as it was not performed. Changes to the system which add resiliency to the system may have changed a previous critical station to a non-critical station. Not studying it going forward means that the costs would continue to be incurred for protecting a station that does not require it.

ITC also suggests the following revisions to Requirement R5.

The revised draft CIP-014-4 Requirement R5 includes a new statement: “If proximate Transmission station(s) and Transmission substation(s) were identified in Requirement R2, they should also be included in the risk assessment.” EEI suggests removing this sentence because Requirement R5 already requires TOs to perform a risk assessment using the methodology established in Requirement R3, and Requirement R3 part 3.3.2 includes Transmission station(s) and Transmission substation(s) determined in accordance with Requirement R2 as being in proximity to an applicable Transmission station or Transmission substation.

Additionally, including the separate reference to “proximate Transmission station(s) and Transmission substation(s)… identified in Requirement R2” in Requirement R5, could be confused for an expansion in scope because, as written, the reference is to identified proximate Transmission station(s) and Transmission substation(s) in Requirement R2, not those that are identified through the performance of the Requirement R5 risk assessment. Furthermore R4 should not be included in R5. Only stations identified in R1 need to be reviewed to determine if they are jointly owned. R4 should only identify those stations identified in R1 that an entity would no longer need to study as the other joint owner will be performing it. The scope of Requirement R5 is important because of its tie to Requirements R8-R10.

ITC suggests the following:

R5. At least once every 36 calendar months, each Transmission Owner shall perform a risk assessment to identify applicable Transmission station(s) and Transmission substation(s) identified in Requirement R1, that if rendered inoperable or damaged could result in instability, uncontrolled separation, or Cascading within an interconnection, using the methodology established in Requirement R3, excluding any Transmission station(s) and Transmission substation(s) identified in accordance with Requirement R4 to be reviewed by the entity identified in R4.. If proximate Transmission station(s) and Transmission substation(s) were identified in Requirement R2, they should also be included in the risk assessment.”

Comment	
PJM does not recommend relying on past risk assessments, and instead recommends status quo to ensure a more accurate assessment of the Transmission station or Transmission substations. This is based on PJM's observation of major planning assumption changes in recent years that have been impacting reliability analysis.

Answer	Yes
Document Name	

Comment

As stated in our response to Questions 3 above:

To reduce the burden on smaller TOs of developing an R3 methodology and performing the R5 planning studies, consider providing an option for entities to use the list of transmission stations or substations obtained from the Attachment 1 analysis, as the input to R7 for primary control center determination, and as the input to R8 to begin the physical attack evaluation. Attachment 1 would therefore be an option as the R3 methodology that would then be applied in R5. R4 would still be required. The R6 third party review would be limited to a review of the Attachment 1 analysis.

6. Do you agree with the Implementation Plan for CIP-014-4? If you think an alternate timeframe is needed, please propose an alternate implementation plan with a detailed explanation.

Gail Elliott - Gail Elliott On Behalf of: Michael Moltane, International Transmission Company Holdings Corporation, 1; - Gail Elliott

Answer	No
Document Name	

Comment

ITC believes there could be issues with identifying all of the proximity stations soon enough to identify their configurations and clearing times soon enough to perform all of the required studies. This is more of an issue as entities add facilities in additional states. The number of coordination agreements could also cause an issue in obtaining all of the required documentation.

Richard Vendetti - NextEra Energy - 5

Answer	No
Document Name	

Comment

Nextera supports EEI comments below:

EEI is concerned that the implementation plan requires the initial risk assessment required by CIP-014-4 to be completed on or before the effective date of the Standard and does not provide a phased in approach. The modifications required by the proposed CIP-014-4 include new processes to be established prior to initiating new risk assessments. The proposed 24-month timeline is not reasonable for completing the initial risk assessment. EEI suggests allowing the initiation of CIP-014-4 risk assessments to occur on or before the effective date of the standard to allow additional time to modify programs.

Rebika Yitna - Rebika Yitna On Behalf of: Roger Brand, MEAG Power, 3, 1; - Rebika Yitna

Answer	No
Document Name	

Comment

Due to the varying risk assessment schedules of entities, the 24 month implementation plan could burden entities who have completed a risk assessment shortly before the effective date of CIP-014-4 and have limited resources to complete another one in a short amount of time. Proposed language: 36 months from the entity's last risk assessment completed or 36 months after the effective date of the standard, which ever is later. This will provide adequate time for entities to adjust to the additional criteria for the risk assessment methodology.

Jamison Cawley - Nebraska Public Power District - 1

Answer	No
Document Name	

Comment

The requirements for an unaffiliated third-party verification of the TO's risk assessment should be removed entirely. This requirement has increased the cost, time and resources required for each TO to perform the risk assessment. We have found that the third-party verification is not used by the RE for any compliance enforcement actions. If the third-party verification provides no value to this process, it should not be included in the CIP-014 requirements. If the 36-month RA requirement is approved, this issue will only become more burdensome.

Matt Carden - Southern Company - Southern Company Services, Inc. - 1

Answer	No
Document Name	

Comment

It potentially could be excessively burdensome on a Transmission Owner (TO) to be required to perform a new risk assessment study within 24 months of the effective implementation date of the revised CIP-014-4 standard. Additionally, limited resources may be available to complete a verification within 90 days of the effective date per Requirement R6.

For example, given the current CIP-014-3 R1.1 30 calendar month subsequent risk assessment requirement schedule for a TO which has substations identified under R1, the TO may currently be required to complete a subsequent R1 study as of September 30, 2025.

If the revised standard has an effective implementation date of October 1, 2025, the TO would be required to complete a new R1 study within 24 months of October 1, 2025. A more effective and efficient methodology is a phased approach based on the TO's completion date of the TO's most recent R1.1 subsequent risk assessment study.

Proposed Language: Each TO shall conduct its first assessment under CIP-014-4 within 36 calendar months after the effective date or within 36 calendar months after their last assessment under CIP-014-3, whichever occurs later.

Comment

The implementation plan accelerates the compliance timeframe specified in the standard. The proposed implementation plan is 24 months. This means some Transmission Owners may have insufficient time, less than 36 months, to complete their next assessment based on the new standard. The implementation plan should be adjusted to 36 months.

MPC holds the position that requiring completion of a CIP-014-4 risk assessment prior to the effective date of the Standard presents duplicative efforts coupled with limited study resources. MPC suggests that entities with a completed risk assessment per CIP-014-3 be required to follow the new assessment frequency once the Standard becomes effective in accordance with R5.

BPA repeats it recommendation to use terminology like that found in other standards such as FAC-014-3 R6:

“Requirement R6 shall be implemented by the Planning Coordinator or Transmission Planner following the effective date of FAC-014-3 when it begins its next cycle for conducting the studies to support its Planning Assessment."

BPA believes the inclusion of this language would alleviate concerns about having to comply with a requirement prior to its mandatory enforcement date and help to reduce overall costs for the implementation of the changes.

Comment	
Southern Company recognizes the financial impacts of performing the risk assessment every 36 months rather than 60 months for Transmission Owners that have not identified any Transmission stations or Transmission substations. This is magnified by the requirement to have an unaffiliated third party verify the risk assessment at a higher frequency.

Answer	No
Document Name	
Comment	
The comments above demonstrate that additional clarity is needed on certain portions of this revised CIP-014-4. Without that additional clarity, Oncor cannot state that the proposed changes to CIP-014-3 are cost effective. As noted above, some of the proposed revisions create additional work for TOs that could increase the TOs' costs. For example, the revised Requirements R2 and R4 will require Oncor to develop, document, and implement new procedures and processes, as well as to develop and implement additional training concerning the new requirements and the new procedures and processes.

BPA does not believe the standard, as is, is cost effective in addressing the reliability of physical security. The spectrum of sites is too broad. BPA believes there is high potential for sites to be identified on CIP-014-4 list that would have little to no effect on the BES if they were disconnected from the grid. The standard, as is, allows sites with RAS capability to be listed as CIP-014, which mitigates an enormous amount of risk, some might argue all. The number of sites that could potentially be categorized as CIP-14 takes resources away from other sites along critical pathways, and sites that directly link to critical infrastructure. Additionally, day-to-day operations of upstream and downstream sites affect whether singular or multiple pieces of equipment in a site are critical. BPA finds the inclusions of R2.1 and R2.2 are so broad as to compound the issues of cost without a large gain in security or reliability. BPA believes the increase in CIP-014 applicability may require more resources than some smaller Transmission Owners have at their disposal. This increase will not only strain the resources of those smaller Transmission Owners but those of larger size within a BA that may be called upon to assist.

Please see comments provided for R2. More technical guidance from NERC on damage distances for a variety of bomb treat types is desired and modifying the distance requirement in R2 to be based upon technically-supported damage distances rather than personnel evacuation mandates is recommended. Additionally in R2, allowing utilities the flexibility to provide rationale in their CIP-014 assessments for why any identified proximate stations within the provided distance should be excluded or if any different distances are used would lead to more realistic physical security scenarios being assessed and reduce the cost-burden of assessing scenarios that are beyond reasonable damage distances.

Stephen Stafford - Stephen Stafford On Behalf of: Greg Davis, Georgia Transmission Corporation, 1; - Stephen Stafford

Answer	Yes
Document Name	
Comment	

Currently, CIP-014 requires Transmission Owners to conduct planning analyses, and then have these analyses reviewed by a third party verifier. Requirement 6.1 states the the third party verifier must be a registered Planning Coordinator, Transmission Planner, Reliability Coordinator, or have transmission planning or analysis experience. The TO is not the appropriate registered entity to conduct planning analyses. Our understanding is that this is the reason why the standard requires a third party verification by a PC, TP, or RC. Apparently, NERC agrees that the analysis is best suited for the PC, TP or RC function. Furthermore, the fact that the standard is being revised to assure an adequate and consistent approach in evaluating instability as well as the identification of infrastructure critical to the operation of the BPS, supports the premise that the TO-performed study followed by verification by an unaffiliated third party is not a sufficient method. The better method would be to have an affiliated TP or PC to conduct the analysis. It is not cost effective to require the TO to conduct a planning study and then pay an unaffiliated third party to review the study. This is especially true if the TO is also a registered TP or PC. The TP and PC are the best qualified to conduct such studies. Furthermore, since CIP-014 is being revised to be more prescriptive regarding what should be included in the study methodology, the need for third party verification is significantly decreased. GTC recommends that requirement to perform such an analysis be assigned to the TP or PC functions within the TPL group of standards.

Answer	Yes
Document Name	
Comment	

Rather than requiring Transmission Owners without identified applicable Transmission stations/substations to perform a risk assessment every 36 months, it would be much more cost effective to allow utilities without critical (sub)stations to continue to perform the risk assessment every 60 months. The concern that a 60 month assessment may not include all planned facilities before the subsequent risk assessment is performed 60 months later could be allayed by changing the requirement to include facilities planned to be in service within the next 60 months rather than the next 24 months as required in CIP-014-3.

Comment
Yes. While this SAR focused on modification to R1, the standard could meet the intent of the original FERC order in a more cost effective manner by modifying subsequent requirements to allow for Transmission system reinforcement that would reduce the impact of damage to a Transmission station on the Interconnection as an alternative solution to physical security protections.

Jamison Cawley - Nebraska Public Power District - 1	
Answer	Yes
Document Name	

Comment
All of the extreme critical fault scenarios are already being evaluated under the TPL-001 standard which has clear definitions of how, where, what and why. This CIP-014 standard requires undocumented and undefined requirements be included in the risk assessment, which does not satisfy the original intent of the Physical Security Standard. If we want to increase physical security at BES substations, a clear bright line criteria should be established based on kV level and number of interconnections like other CIP standards. Inclusion of vague risk assessment criteria wastes valuable resources which could better be spent focusing on the transmission planning system performance and development of a more robust grid which is not susceptible to the loss of any single applicable substation.

Comment	

An alternative could be requiring a certain level of security be applied consistently across BES substations (i.e., not limited to CIP-014 substations).

These basic requirements could include: 1) security-grade perimeter fencing 2) remote surveillance via motion-sensing video cameras, and 3) local measures such as motion sensor-activated lighting and break-in audible alarms.

When applied at new substations or as these are improved over time, the incremental cost is not significant and supports a hardened system at a broader level.

As stated in our response to Questions 3 & 5: To reduce the burden on smaller TOs of developing an R3 methodology and performing the R5 planning studies, consider providing an option for entities to use the list of transmission stations or substations obtained from the Attachment 1 analysis, as the input to R7 for primary control center determination, and as the input to R8 to begin the physical attack evaluation. Attachment 1 would therefore be an option as the R3 methodology that would then be applied in R5. R4 would still be required. The R6 third party review would be limited to a review of the Attachment 1 analysis.

System-wide performance evaluation is the accountability of the Reliability Coordinators. Therefore, if the standard must have system-wide (Interconnection) performance testing and judgement of results, the RC must be involved. Not every facility owner will be able to do this. The standard should be practical to implement. See attached for comments.

Monika Montez - California ISO - 2 - WECC, Group Name ISO/RTO Council Standards Review Committee (SRC)

Answer	
Document Name	

Comment

The ISO/RTO Council (IRC) Standards Review Committee (SRC) notes that Criterion 3 in Attachment 1 references Facilities identified by the Planning Coordinator as critical to the derivation of an Interconnection Reliability Operating Limit (IROL). However, under FAC-014-3, Planning Coordinators no longer develop IROLs. The SRC recommends that criterion 3 be updated accordingly to remove the reference to the Planning Coordinator.

The SRC also recommends that the drafting team revise the Technical Rationale to indicate whether the unaffiliated third-party validation under Requirement R6 requires the third party to validate the risk assessments completed in accordance with both Requirements R1 and R2 or just

Requirement R1. The current Technical Rationale only indicates that validation of Requirement R1 risk assessments is required. The Technical Rationale should also be updated to more clearly correct and clarify all references to requirements to align with the newly proposed CIP-014-4 Requirements R1-R5.

Alternatively, a new SAR could be developed to remove Requirement R6 from the proposed CIP-014-4 standard. The new requirements proposed in CIP-014-4 Requirements R1-R5 outline necessary specifics for more meaningful risk assessments, which reduces the need for unaffiliated third-party verification, especially given that auditors are also directed to apply various methods to test the validity of station identifications under current CIP-014-3 Requirement R1.[1]

Seminole Electric Cooperative would like clarification on:

1. In Attachment 1 – Applicability Criteria, If a generator has a Collector bus, but the collector bus also serves as a Transmission Facility, how is it classified? Is it classified as a collector bus or Transmission Facility?

2. How to classify a transmission station/substation that has one line that exits, has a tap half a mile out for example, then goes to two separate Transmission Facilities? How do we count the weight of the transmission station/substation that has one line exiting but it systematically connected to two Transmission Facilities?

3. In requirement R2, are proximate Transmission stations in scope even if they are not BES?

Understanding that R6, formerly R2 under CIP-014-3, is out of scope for this SAR, WAPA recommends a SAR be drafted to remove R6 as an administrative burden that should no longer be needed, given that this project has added the necessary specifics required for a meaningful risk assessment, diminishing the need for third-party verification. Also, there has been anecdotal experience as an industry that auditors have audited the (CIP-014-3) R1 risk assessments directly without relying on the R2 third-party verification as directed by the RSAW. If (CIP-014-4) R6 is to be retained,	

90 calendar days for completing R6 in R6.2 is proving to be tight for some larger entities, which request extension to 180 calendar days (which would be much easier to calculate as six calendar months to avoid getting tripped up on 28/30/31-day months).

This standard does not use the glossary term "Facility" other than in Attachment 1 and the exemption portion of 4.1.2 in the Applicability section; this creates ambiguity on whether the proximate stations identified in R2 are required to meet BES criteria or not. Strategic use of that term may alleviate some of the confusion around that requirement expressed during the webinar.

- NYPA still believes that Requirement R2 remains vague and open to varied interpretations. For example, under R2 when evaluating the proximate transmission substations, the language in R2 is unclear whether any BES transmission station regardless of its voltage level should be assessed if it falls within 1,500 feet of a station identified in R1. We recommend SDT should give guidance in the standard itself if possible. The proximity of 1500ft tends to have more impact in urban cities therefore we recommend the SDT to consider this situation as well.
- Also regarding R3.1, it would be helpful if the SDT could provide guidance on the 'minimum' threshold for identifying unacceptable generation or load loss to support more consistent interpretation and understanding.
- Many interconnections projects, at least in the NPCC region, put a placeholder of in-service date of within 3 years, but these dates are often extended based on project specific timelines. Requiring a 36 month risk assessment (R1) would force TOs to study those projects which may not materialize within the said timeline or likely to have their ISDs extended, placing an unnecessary burden on TO's planning and study resources.

- Under R2 clarify if "proximate" substation voltages must be 200kV and above or if the scope included all BES voltages.
- Technical Rationale for R3 part 3.4 states: *"the term "inoperable" includes the total loss of communication and protection equipment at the substation, necessitating delayed clearance from far-end relaying to isolate the event's impacts."* Clarify if this total loss of equipment is for only the applicable substation or also includes the proximate substation equipment.
- The Technical Rationale should clarify that fault type and fault location in a substation will be defined in the TO methodology.
- Per the 7/8/25 WebEx Q&A "the standard is silent" on what voltages to simulate faults on in a single substation with multiple voltages (ex 345kV with 230kV or 115kV). The Technical Rationale should clarify that this can be defined in the TO methodology.
- The Technical Rationale should clarify if the intent of the standard is for simultaneous faults to be simulated at applicable and proximate substations per the statements made on the 7/8/25 WebEx Q&A.

Matt Carden - Southern Company - Southern Company Services, Inc. - 1

Answer	
Document Name	

Comment

Under “Purpose” we prefer the previous language of “as a result of”.

Southern Company recommends swapping Requirement R3 and R4 chronologically. This follows a more logical approach of identifying the stations and responsibilities to perform the assessment in the first three requirements followed by an assessment methodology in R4 and the performance of an assessment in R5.

Southern Company recommends removing Requirement R6. With the understanding that this is not explicitly in scope of the current SAR, the added specificity of the proposed standard eliminates the reliability benefit of the third-party verifier. Additionally, based on a previous audit of CIP-014-3, Southern Company did not observe the Regional Entity take into consideration the review by the R2 third party verifier. If this is consistent across other Regional Entities, then an elimination of CIP-014-4 R6 may be appropriate due to the extra cost and the lack of a reliability benefit.

Comment	
AEP is supportive of the VSLs, except for R2. Currently, R2 only specifies a Severe VSL with specific reference to “fence line” in the VSL table. This increases the likelihood of severe violations being identified based on disagreements on the method of distance calculation, which is not a high risk reliability objective. Lower severity VSLs should be identified for R2. Thank you for being so responsive to comments from the previous version to this version!

Similar to TPL-001-5.1 Requirement 2.6, we recommend that the SDT consider, and if applicable, outline under which specific circumstances past studies/results can be utilized for the CIP-014-4 risk assessment. The possible use of past studies may reduce workload of entities and support a more cost effective option to address CIP-014-4 needs.

Manitoba Hydro agrees with the modifications made for R5, especially the addition of the new sub-requirement R5.2. However, it will be hard for a third-party reviewer to verify a current assessment unless the results of the previous assessment are provided with the current assessment Manitoba Hydro recommends that requirement R6 be removed from the standard as it is overly administrative. The revisions made from this project specifically outline study requirements and an additional third party review of the study is no longer necessary. In addition, if there were minimal changes to the network from the previous third-party assessment, a new third party assessment provides very little value. The NERC Quality Review (QR) team may be able to assist with this change to make the standard more efficient and cost effective.

Consider the addition of definitive or explicit trigger for Requirement R8 if the identification of the critical asset remains unchanged. Without this it creates a significant blind spot because the threat environment can evolve and shift dramatically over the 36-month cycle or even since the initial assessment or implementation of the required physical security controls. Without a built-in mechanism to re-evaluate threats entities may overlook new or emerging vulnerabilities, leaving critical assets exposed.

The primary issue with this standard as it is written, and as this draft continues is the application of requirements/expectations appropriate for the Transmission Planner/Planning Coordinator function to the Transmission Owner instead. This reduces clarity on the types of studies to be performed to assess the extreme events identified in this standard.

Regarding R6:

With an attempt at clarifying study criteria, though they should be applied to the appropriate planning entity, there is no reason to maintain a requirement for an unaffiliated third party to perform a verification of a transmission planning analysis associated with the risk assessment. Instead of requiring planning entities be the third party verifier, they should just perform the study under clearly defined requirements in a TPL standard and communicate

this information to the Transmission Owner. It is also important to note the third party verifying the risk assessment for this physical security standard is not required to have expertise in that area according to this requirement. Additionally, the SDT should consider removing the Reliability Coordinator as a potential third party verifier as that function does not perform the type of analysis being sought in this standard.

Additional Comment:

The analysis outlined in the CIP-014 standard is an evaluation of an extreme event and is based on transmission planning analysis. Currently, the existing TPL-001 standard requires the evaluation of extreme events, though, it is not specific to this particular substation outage analysis and corrective actions are not required for these events. Additionally, there are ongoing efforts to establish a separate standard to address the long-term planning analysis around extreme weather events. It would seem NERC and the industry are potentially missing an opportunity to consolidate requirements around the evaluation of extreme events better than what is currently provided for in the current construct of the existing and planned Reliability Standards. Consideration should be given by NERC to provide a better pathway to house long-term planning requirements around extreme event analysis within the TPL standards (not CIP) and specify the reliability analyses needed, the parameters for determining reliability, expectations for corrective actions, and the communication path from planning to owners and others with a reliability-related need for this information. The planning assessment/CAP required by TPL-001 is already required to be distributed to applicable owners. Clarifying the extreme event expectations in TPL-001 to specify the substation outage alluded to in CIP-014 is one pathway to better align standard requirements with the appropriate entity.

BPA appreciates the opportunity to comment. BPA recognizes CIP-014 and physical security are growing beyond the intent of the original standard. BPA recommends evaluating the need to add additional NERC registrations to the standard applicability to broaden the available information required within CIP-014-4. BPA has noticed a possible grammar error with the redline of the technical rationale. Under the Rationale for Requirement R3, Part 3.1, located in the second line of the second paragraph Transmission substation is repeated twice. BPA believes this was supposed to follow the NERC glossary of terms and read “Transmission stations or sub-stations.

There were 74 sets of responses, including comments from approximately 160 different people from approximately 98 companies representing 8 of the Industry Segments as shown in the table on the following pages.

All comments submitted can be reviewed in their original format on the project page.

If you feel that your comment has been overlooked, let us know immediately. Our goal is to give every comment serious consideration in this process. If you feel there has been an error or omission, contact Director, Standards Development, Jamie Calderon (via email) or at (404) 446-9647.

Questions

1. Do you agree with the modifications made in CIP-014-4 with modified Requirement R1 to address the issues identified in the SAR? If you do not agree, please provide your recommendation and, if appropriate, technical or procedural justification.

2. Do you agree with the modifications made in CIP-014-4 with new Requirement R2 to address the issues identified in the SAR? If you do not agree, please provide your recommendation and, if appropriate, technical or procedural justification.

3. Do you agree with the modifications made in CIP-014-4 with new Requirement R3 to address the issues identified in the SAR? If you do not agree, please provide your recommendation and, if appropriate, technical or procedural justification.

4. Do you agree with the modifications made in CIP-014-4 with new Requirement R4 to address the issues identified in the SAR? If you do not agree, please provide your recommendation and, if appropriate, technical or procedural justification.

5. Do you agree with the modifications made in CIP-014-4 with adding Requirement R5 to address the issues identified in the SAR? If you do not agree, please provide your recommendation and, if appropriate, technical or procedural justification.

6. Do you agree with the Implementation Plan for CIP-014-4? If you think an alternate timeframe is needed, please propose an alternate implementation plan with a detailed explanation.

7. Do you believe there are alternatives or more cost-effective options to address the recommendations in CIP-014-4 to address the reliability issue of physical security? If so, please provide your recommendation and, if appropriate, technical, or procedural justification.

8. Provide any additional comments for the Drafting Team to consider, if desired.

MPC continues to strongly disagree with the use of a 36-month timeframe for utilities who have not previously identified stations or substations as applicable. Increasing the study frequency from every 60 months to every 36 months increases the study burden and cost for utilities without applicable Transmission station(s) or substation(s) while providing no documented benefit to reliability of the BES. MPC proposes to retain the every 60 month requirement for entities that have not identified applicable assets, and include Transmission station(s) and Transmission substation(s) planned to be in service within 60 calendar months. Please see MPC's response to Question 5 for more discussion.

Question for the SDT: Considering the Measure 1 verbiage ("evidence may include, but are not limited to, dated written or electronic documentation of the Transmission station(s) and Transmission substation(s) (existing and those planned to be in service within 36	

calendar months) that meet any of the criteria in Attachment 1."), what action is needed to demonstrate compliance with respect to "identifying" applicable stations, and what notification(s) is needed? Our observation is that the Req #1 verbiage and the Measure 1 verbiage do not align. Additionally, we observe that the term "applicable" station is introduced in Req# 1 and is used throughout the standard. The term "proximate" station is introduced in Req #2 and is referred to in Reqs 3.3 and 5. Based on this revision to the standard, these are two distinct sets of stations (applicable and proximate). We observe that for a few requirements / sub-requirements, there may be a possible gap or point of confusion as to whether a proximate station needs to meet the requirement / sub-requirement. As a general comment, we recommend that the specific use of both of these terms be reviewed in fine detail to ensure no that there will no confusion as to whether a requirement pertains to an applicable station, a proximate station, or to both.

Likes 0	
Dislikes 0	

Response
Thank you for your comment. The drafting team looked the measure over and believes that the verbiage is clear. From the SAR work scopes, neighboring BES stations must be considerate. Requirement R3, Parts R3.3.2 and R3.4, as well as Requirement R5 spelled out what exactly applicable entities should do for proximate stations. The drafting team made some modifications in Requirement R2 to clear some confusion.

Steven Belle - Dominion - Dominion Virginia Power - 1

We do not support the change from 60 months (with no previous applicable substation) to 36 months as there appears to be no technical basis that supports this change. This timeframe causes the Transmission Owner (TO) to enter an unknown state of compliance with CIP-014 if they are on Years 4-5 from the previous 60-month Requirement. The current state of the risk assessment requirements is subjective and TO’s should not be forced to perform subjective study efforts on a more frequent basis which only pulls important resources in directions that provide no value to the industry. Further, most significant EHV expansion projects which would actually change the previous base case assumptions do not occur every 36 months and are more in line with 60-month construction periods.

Response	
Thank you for your comments. A directive of the SAR was to “correct any discrepancies between the study period, frequency of study, and the base case{s} a Transmission Owner uses.” The Drafting Team chose a timeframe that balanced the directive of the SAR and the comments from industry to make the timeframe either shorter or longer than 36 months.

2. Do you agree with the modifications made in CIP-014-4 with new Requirement R2 to address the issues identified in the SAR? If you do not agree, please provide your recommendation and, if appropriate, technical or procedural justification.	
Emma Halilovic - Hydro One Networks, Inc. - 1	
Answer	No
Document Name	2023-06 Draft_3_Comment_Form.docx
Comment	

See attached for recommendations and rationales.

R2 – Swap the order of R2 and R3; Comments:

- R2 – using "irrespective of ownership" is not acceptable because a transmission owner does not have the authority to require the location (GPS coordinates) of another entity's station unless that other entity is directly connected to them. E.g. a 44kV / 12 kV distribution station (DS) or a 115 kV / 34.5 kV station does not directly connect to the 230 kV transmission system. In fact, DS's are often outside the privy of the Reliability Coordinator too. If NERC would like these nearby stations tested (modelled with protection settings) for the potential of inducing system separation, system instability and uncontrolled cascading, then extend the Applicability of the standard to these non-transmission owner entities. In addition, the testing of these nearby facilities is unreasonable considering they are far from meeting Attachment 1 criteria.
- R2 - The focus of these "smaller" nearby stations is misplaced, as physical security is more threaten by other infrastructure such as railroads, paint factories, fireworks factories, gas stations, major highways with tankers containing explosive material, high-rise buildings etc…
- R2 – recommend not pursuing the requirement to electrically fault test these small nearby stations as there is no-benefit and is not practical to do so.

Response	

Thank you for your comments. The drafting team made revision to Requirement R2 and clarified that only BES stations are in scope for proximate stations. The drafting team is tasked to protect the electrical grid by considering adjacent Transmission stations or Transmission substations of differing ownership, not railroads, paint factories, fireworks factories, gas stations, major highways with tankers containing explosive material, high-rise buildings. After the clarification being made (by adding BES), the drafting team believes that there is a risk by losing multiple BES stations as once.

Lucinda Bradshaw - Lucinda Bradshaw On Behalf of: Byron Booker, Oncor Electric Delivery, 1; - Lucinda Bradshaw	
Answer	No
Document Name	
Comment	
Oncor appreciates that the ambiguous sub-requirements have been removed from Requirement R2, but ambiguity remains in the proposed revised Requirement R2. As a result, Oncor does not fully agree with the modifications made in new Requirement R2.	

Oncor's previous comment on revised Requirement R2 requested clarification as to what voltage classes are applicable for proximate Transmission stations and Transmission substations. In the Drafting Team's response, the Drafting Team clarified that proximate Transmission stations and Transmission substations should only be considered if they are part of the Bulk Electric System (operated at 100 kV or higher). At no point is this clarified in the language of the revised Standard. Because the Standard currently only identifies an exclusion for voltages below 200 kV, Oncor recommends CIP-014-4 Requirement R2 be clarified by adding a statement that proximate Transmission stations and Transmission substations only require consideration if they are part of the Bulk Electric System. Oncor proposes that the following sentence be added to the end of the existing proposed revised Requirement 2: "***Transmission Owners only need to identify proximate Transmission station(s) and Transmission substation(s) that are part of the Bulk Electric System.***"

Oncor also previously commented on the burdensome task of coordination with other parties to track Transmission stations and Transmission substations that are owned by other parties to determine if any stations are within the specified distance threshold. The Drafting Team clarified that there is no need to coordinate with another entity; rather, the Transmission Owner (TO) may use "common public access tools" to identify proximate Transmission stations and Transmission substations. While the use of such tools (*e.g.*, GIS data) may alleviate coordination burdens, it introduces new burdens on TOs to manually review each and every applicable Transmission station and Transmission substation for nearby stations. Oncor has three additional concerns that should be noted related to the use of GIS data:

· GIS data for an area can be low resolution, limited, or entirely unavailable.

· Another complication that could arise is that TOs may unknowingly use GIS data that is out-of-date and no longer representative of the subject area. For example, if a TO used the most recent imagery available from Google Earth to perform its review of an area in 2025, and that imagery was created in 2023, then that imagery would not include any nearby Transmission stations that were built in 2024. Then the TO's review performed in 2025 would not include any proximate stations built in 2024.

· Even if a TO uses current year GIS data in an effort to identify proximate Transmission stations and Transmission substations, this still would not allow the TO to identify planned but not completed proximate stations. For example, a TO could use GIS data to identify proximate stations in 2025, but if in 2026 a new proximate station was built, then the proximate station built in 2026 would not be accounted for in the 2025 review.

Response	

Thank you for your comments and suggestion. The drafting team did take the feedback and added BES into Requirement R2. The drafting team is also aware that the GIS is not 100% accurate and Google Earth cannot see future planned stations. The drafting team did clarify with this new revision by adding "existing BES".	
Wesley Maurer - Lower Colorado River Authority - 1 - Texas RE	
Answer	No
Document Name	
Comment	
We do not agree with the changes to R2 as currently written. The use of the term "identify" is unclear, it's not obvious whether this requires documentation or ongoing tracking. There's also no voltage threshold provided, adding a voltage threshold could provide more clarity and keep from including stations that aren't relevant from a security perspective. It is also uncertain what is expected once these substations are identified, particularly if they are owned by another entity.	
Likes 0

Comment	
ITC supports the distance of 1500 feet or 457 meters (the shortest distance, measured substation fence line to substation fence line) selected by the drafting team for proximate Transmission station(s) and Transmission substation(s). However, we are concerned Transmission stations and Transmission substations owned by other entities who CIP-014 may or may not be applicable cannot be compelled to provide the information necessary for entities to comply with CIP-014. Further, while GIS tools can identify stations and	

substations within the specified proximity, it can be difficult to determine whose station they might be and if they are Transmission station(s) or Transmission substation(s) ITC suggests narrowing the scope to existing BES Transmission station(s) and BES Transmission substation(s) which are owned by the applicable entity. R2. Each Transmission Owner shall identify proximate **BES** Transmission station(s) and **BES** Transmission substation(s), owned by the applicable TO, within 1500 feet or 457 meters (the shortest distance, measured substation fence line to substation fence line) of an applicable Transmission station or Transmission substation identified in Requirement R1. [Violation Risk Factor: Medium; Time-Horizon: Long-term Planning] ITC asks the drafting team to consider adding content to the technical rationale describing ways that an entity can be confident of to demonstrate compliance that are not cost prohibitive for companies with facilities in numerous states. Concern is identifying stations not owned by the TO.

EEI supports the distance of 1500 feet or 457 meters (the shortest distance, measured substation fence line to substation fence line) selected by the drafting team for proximate Transmission station(s) and Transmission substation(s). However, we are concerned Transmission stations and Transmission substations owned by non-registered entities are not compelled to provide the information necessary for entities to comply with CIP-014. Further, while GIS tools can identify stations and substations within the specified proximity, it can be difficult to determine if they are Transmission station(s) or Transmission substation(s). EEI suggests narrowing the scope to BES Transmission station(s) and BES Transmission substation(s) which are owned by registered entities who would be compelled to share CIP-014 related information. R2. Each Transmission Owner shall identify proximate **BES** Transmission station(s) and **BES** Transmission substation(s), irrespective of ownership, within 1500 feet or 457 meters (the shortest distance, measured substation fence line to substation fence line) of an applicable Transmission station or Transmission substation identified in Requirement R1. [Violation Risk Factor: Medium; Time-Horizon: Long-term Planning] EEI asks the drafting team to consider adding content to the technical rationale describing ways that an entity may choose to accurately measure distances and demonstrate compliance. For instance, Google Earth measurements, leveraging internal personnel, hiring a surveying company etc.

Comment
The use of the word “proximate” appears to imply an estimation and leaves the determination of what constitutes a nearby Transmission Substation or Station to the discretion of the entity. However, the requirement specifies a precise distance and a method for measuring that distance. NPCC RSC recommends removing the word “proximate.” NPCC RSC also recommends modifying Requirement R2 to read: “Transmission station(s) and Transmission substation(s) identified in CIP-002.” If the intent is to conduct a separate process or analysis to identify applicable assets, that assessment should be performed under CIP-002.

Consider putting back the "line of sight" and "ease of access" language since physical attacks or the likelihood of physical attacks could be evaluated based on how easily accessible (physically) stations are to one another.

Likes 0	
Dislikes 0	

Response
Thank you for your comments. So many registered entities commented that "line of sight" and "ease of access" language is vague and want them to be removed. The drafting team used the distance as bright-line to make it less confusing.

We do not agree with using proximity as the only triggering factor for this requirement. An entity (particularly urban utilities) may have transmission stations within 1,500 feet of each other but due to their design (i.e., Open Air vs. Enclosed) the impact of a possible physical attack can be mitigated. It would be impossible to have simultaneous faults at the applicable and proximate station under those circumstances. An example of a revised R2: R2: Each Transmission Owner shall identify proximate open-air Transmission station(s) and Transmission substation(s), irrespective of ownership, within 1500 feet or 457 meters (the shortest distance, measured substation fence line to substation fence line) of an applicable Transmission station or Transmission substation identified in Requirement R1 Additionally, the technical rationale does not include the name or a link to the study that was the basis for this modified requirement; knowing what specific reliability concerns this modified requirement was intended to mitigate would be helpful.

We disagree with the 1,500 feet requirement as there is no clear definition of the initiating disturbance. The initiating event could be anything from gunshots up to a “smoking crater” scenario and the impacts to adjacent substations could range from minimal or moderate damage to severe damage, all of which are undefined in this standard. The Physical Security standard was proposed to enhance the physical security at critical BES substations, but there are no enhanced physical security defense mechanisms which can protect a substation from a missile attack which is the only feasible way to result in a “Smoking Crater” scenario at multiple substations. So, the attack scenarios need to be plausible so that realistic physical security enhancements can be deployed to facilitate improvements in the security posture at critical BES substations. The “Smoking Crater” scenario is not plausible and thus the 1,500 feet impact zone is not justified. Assuming a simultaneous 3-Phase fault on every element in a large substation along with each and every element of an adjacent substation within 1,500 feet cannot be technically justified and therefore cannot be a requirement for the risk assessment. Experienced TOs know through prior disturbance analysis events, that 3-phase faults are rare at a single point in the entire transmission system, so they should not be assumed to occur at one exact point in time on multiple elements at multiple substations covering large distances.

SRP recommends establishing clearer criteria for determining station applicability. As currently written, the requirement is open to interpretation, specifically regarding which voltage levels and which stations are included under the phrase " of any applicable Transmission station." To avoid ambiguity, we recommend clarifying section 4 or specifying that Requirement R2 applies only to Transmission stations or Transmission substations identified by the Transmission Owner through the risk assessment process described in Requirement R1, in accordance with the Applicability criteria outlined in Attachment 1.

The use of the word “proximate” appears to imply an estimation and leaves the determination of what constitutes a nearby Transmission Substation or Station to the discretion of the entity. However, the requirement specifies a precise distance and a method for measuring that distance. NPCC RSC recommends removing the word “proximate.”	

NPCC RSC also recommends modifying Requirement R2 to read: "Transmission station(s) and Transmission substation(s) identified in CIP-002." If the intent is to conduct a separate process or analysis to identify applicable assets, that assessment should be performed under CIP-002.

Thank you for your comments and recommendation. The drafting team added BES as recommended.	
Jodi Yeary - AEP - 3	
Answer	No
Document Name	
Comment	
AEP is supportive of the modifications. However, specifying fence line to fence line is too prescriptive. Many utilities already have systems of record for station coordinates/addresses that are currently or can be used for distance calculations that are not based on fence boundaries. This prescriptive boundary language adds unnecessary compliance burden and possibly requires TOs to create and maintain a new system of record. AEP's preference is to leave boundary definitions to the TOs discretion as long as their methodology for distance calculation is documented.

Comment	

Black Hills Corporation agrees with EEI regarding the new requirements in R2. We support the distance of 1500 feet measured between the closest sections of substation fencing. However, we have concerns about non-registered entities not being compelled to provide information necessary for registered entities to comply with CIP-014-4. Black Hills Corporation agrees with EEI's recommendation of adding the 'BES' verbiage to Transmission station and Transmission substation to reduce the scope to entities who would be compelled to comply with CIP-014-4. We also agree with the suggestion to add acceptable ways to measure the distance between substations into the technical rationale for clarity.

Isidoro Behar - Long Island Power Authority - 1	
Answer	No
Document Name	
Comment	
PSEG Long Island Agrees with the majority of changes provided to R2, including the fence line to fence line criteria, revision to distance (1500ft, and removal of criteria previously in 2.1 and 2.2. One improvement would be to include language, to prevent ambiguity of responsibility. Suggested change: "***Each Transmission owner with applicable Transmission station(s) and Transmission substation(s) identified in Requirement R1 shall***….." . This language aims to prevent adjacent transmission owners whose facilities do not meet the criteria identified in R1 from speculating about the proximate facilities, and future projects, of adjacent transmission owners. It's reasonable that the TO's facility who meets the criteria under R1 could identify electrical transmission facilities within the 1500ft distance outlined in R2.

Answer	No
Document Name	
Comment	

1) PGAE does not agree with the language of “irrespective of ownership". PGAE does not have authority to evaluate other entities facilities and potentially create a document of record that other entities could be held accountable. Also, PGAE does not want a compliance obligation tied to an entity that we have to authority over.

2) Reviewing the bomb threat standoff card, the reference to 1700 feet of standoff appears to be a reference to the mandatory evacuation distance for a 40 foot Semi-Truck trailer filled with 60,000 pounds of explosives. PGAE does not agree that Vehicle-Borne Improvised Explosive Device (VBIED) are a prevalent enough attack vector that private utilities should be required to protect against them. There are far greater immediate threats.

3) “Proximate Station” Screen-1500 ft Fence-to-Fence Criterion (R2) - The new requirement to list any transmission station located within 1500 ft of a candidate facility acknowledges the risk of multi station, single attack scenarios, yet the fixed distance appears arbitrary. To prevent over or under inclusion, especially in dense urban corridors, PGAE recommends that NERC cite the threat analysis that produced the 1500 ft requirement and allow entities to justify an alternative distance if a quantified risk assessment shows equivalent or better coverage. This added clarity will reduce regional interpretation disputes and avoid unnecessary modelling effort. This requirement also presents substantial implementation challenges related to inter-utility coordination. Assessing the physical security implications of an attack on a neighboring utility's substation, particularly when there is no existing joint ownership or operational agreement, will necessitate new formal data-sharing protocols and coordination mechanisms. This could lead to administrative complexities, delays in risk assessments, and potential disputes over sensitive information sharing. We urge NERC to provide specific guidance or a recommended template for inter-utility agreements to facilitate this critical coordination.

Comment
FirstEnergy supports EEI Comments which state: EEI supports the distance of 1500 feet or 457 meters (the shortest distance, measured substation fence line to substation fence line) selected by the drafting team for proximate Transmission station(s) and Transmission substation(s). However, we are concerned Transmission stations and Transmission substations owned by non-registered entities are not compelled to provide the information necessary for entities to comply with CIP-014. Further, while GIS tools can identify stations and substations within the specified proximity, it can be difficult to determine if they are Transmission station(s) or Transmission substation(s). EEI suggests narrowing the scope to BES Transmission station(s) and BES Transmission substation(s) which are owned by registered entities who would be compelled to share CIP-014 related information. R2. Each Transmission Owner shall identify proximate **BES** Transmission station(s) and **BES** Transmission substation(s), irrespective of ownership, within 1500 feet or 457 meters (the shortest distance, measured substation fence line to substation fence line) of an applicable Transmission station or Transmission substation identified in Requirement R1. [Violation Risk Factor: Medium; Time-Horizon: Long-term Planning] EEI asks the drafting team to consider adding content to the technical rationale describing ways that an entity may choose to accurately measure distances and demonstrate compliance. For instance, Google Earth measurements, leveraging internal personnel, hiring a surveying company etc.

Randy Peters - Manitoba Hydro - 1,3,5,6 - MRO	
Answer	No
Document Name	

Comment

The technical rationale is not clear for defining the hard limit of 1500 feet as the shortest distance between two substations based on the information presented in a reference guide developed to protect people from a bomb threat, as this is not the only possible hazard addressed by CIP-014. After further review Manitoba Hydro believes the previous criteria in draft-2 are very clear and provide some flexibility for TOs to develop their own proximity criteria. Such guidelines developed by America's Cyber Defense Agency can be referenced as guideline documents by entities when developing their criteria, but it is not recommended to bring those recommendations into a NERC standard as hard limits. If the SDT believed there was a reliability gap or a risk in the CIP-014-4-draft-2 (R2), then the SDT could think about adding another sub-requirement for TOs to develop a documented criteria or include a criteria into the TO's risk assessment methodology .

Thank you for your comment. The drafting team discussed adding 36 calendar months into this Requirement; it seems like another clock has been added and would cause more confusion. Therefore, the drafting team decided to leave it alone.	
Donna Wood - Tri-State G and T Association, Inc. - 1	
Answer	No
Document Name	
Comment	
Tri-State recommends the following: R2 should exclude Transmission stations or substations that are below 200 kV from being considered proximate Transmission stations or substations. Without this exception, the requirement 3.3.2 that faults on proximate stations be studied would result in faults on low voltage systems being studied, despite the general intention of CIP-014 to exclude low voltage stations.	

R2 should permit an exception for stations or substations that are not electrically close despite physical proximity. Substations may be physically close, but not have any transmission line connecting them, such that they are functionally distant for power flow and transient stability purposes. While the substation may be damaged/removed by the same attack, they would not be impacted by each other's faults and would be cleared separately. In addition, the "proximate" substation in this circumstance will frequently be owned by another entity, such that entities will have to perform studies on systems that are entirely owned by others.

Comment

The rationale for the 1500 feet requirement refers to the DHS-DOJ Bomb Threat Stand-off Card for semi-trailier type threats as justification for including this number in R2. However, the distances on the Stand-off Card are related to the mandated personnel evacuation distances for a variety of bomb threats, not necessarily damage distances for these threats. For instance, it would be recommended to use a number that is based upon historical and/or technical research for damage distance of semi-trailer type bomb threats rather than the guidance for safe personnel evacuation distance when considering which stations may be impacted by a bombing event.

Additionally, the measurement from substation fence line to substation fence line can present some unrealistic distance scenarios for CIP-014 assessments, especially for substations that share a fence line with another substation and are located within 1500 feet of a third station. There are situations under these conditions where equipment distances may far exceed 1500 feet, which is already a distance determined by evacuation mandates and not by technically-supported damage distances. For instance, a substation may have a large fenced area with power equipment positioned within the fence perimeter in such a way that distances may far exceed 1500 feet from the proposed event blast location to adjacent “proximate” facilities but would still need to be assessed based upon the proposed R2 draft 3 language.

It is recommended to modify this language to be less prescriptive with this distance requirement and instead allow utilities to either:

- Use the provided R2 distance, whether that is the current revision’s 1500 foot requirement or a distance based upon damage distances (Note: It is preferable the distance number be based upon technically-supported damage distances rather than mandatory evacuation distances, as mentioned above.)

OR

- Allow utilities to select their own distance for identifying proximate stations but require utilities to provide rationale within their CIP-014 methodologies and/or assessments for why they selected a different distance threshold or excluded proximate stations from identification.

It is requested that NERC provide additional guidance or DHS/DOJ/CISA resources for damage distances of various bomb threat types in a similar fashion to the stand-off card for evacuation distances. This would allow R2 to address the intent of the SAR by requiring utilities to

assess semi-trailer type bomb threats to their power systems while also provide additional assessment flexibility and avoiding additional compliance assessment burden for unreasonable scenarios.

Monika Montez - California ISO - 2 - WECC, Group Name ISO/RTO Council Standards Review Committee (SRC)	
Answer	Yes
Document Name	
Comment	
The ISO/RTO Council (IRC) Standards Review Committee (SRC) recommends that the drafting team should account for the fact that the Transmission Owner might be the only entity that has the information needed to determine which Transmission stations or substations are within 1500 feet or 457 meters of an applicable Transmission station or substation under Requirement R2. Consequently, entities performing unaffiliated third-party verifications under Requirement R6 may not be able to verify that a Transmission Owner has properly identified all Transmission stations or Transmission substations within 1500 feet or 457 meters of applicable stations or substations identified under Requirement R1. As a result, these unaffiliated third parties may need to rely on data provided by the TO when no other data is available, which could undermine the usefulness of unaffiliated third-party verifications.

Although the requirement for proximity is simplified from past versions, it is missing the possibility of 2 non-applicable stations (ex. each station with 3-230 kV lines) that if considered proximate (within 1500 feet), may together meet the Applicability criteria. Such a station pair would be missed out from CIP-14-4 requirement R2, as stated currently. Is this an acceptable risk to the interconnection?

Response	
Thank you for your comment. The drafting team discussed the Off-Peak Load case and believes that Off-Peak is necessary for steady-state and dynamic simulations.	
Sean Steffensen - IDACORP - Idaho Power Company - 1	
Answer	No
Document Name	
Comment	
Idaho Power Company (IPC) recommends the Standard not prescribe a specific second case as a low-load scenario. Instead, IPC suggests the Standard require the second case reflect the system's worst-case conditions outside of the stresses applied in the System peak load case. This case could include scenarios that impose additional or independent stress on the system, such as varying seasonal conditions, path transfers, or different load levels. The specific nature of this case would depend on the system's topology, and system operators would be best positioned to determine what additional stresses should be considered. Additionally, IPC seeks further clarification regarding the term "proximate station" in the context of the requirement: "Faults at both the applicable and proximate Transmission station(s) or Transmission substation(s)." Specifically, IPC requests clarification on whether this requirement implies faults should be evaluated simultaneously across all proximate stations, or if each proximate station should be assessed individually in the same manner as the applicable station.	

Likes 0	
Dislikes 0	
Response	
Thank you for your comments. Please see revised Standard. Drafting team added “at least” for the load cases. Registered Entities can do more. Proximate stations is only required to perform simulations in Sub-Requirements 3.3.2 and new 3.5.	
Kevin Conway - Western Power Pool - 4	
Answer	No
Document Name	
Comment	
We believe that the loss of applicable transmission stations should extend to transmission substations identified in R2, where they may result in the physical loss of transmission substations in R1. If the association is intended by the Drafting Team, it is not apparent in how R3 is currently written.

Thank you for your comments. Applicable stations refers to Attachment 1 stations only, not proximate stations.	
Ronald Hoover - Bonneville Power Administration - 1,3,5,6 - WECC	
Answer	No
Document Name	
Comment	
Requirement 3 creates confusion in situations where two or more substations in close proximity have different owners or joint ownership. It is unclear which entity should apply a fault, especially if the owner identified it under R1 and another entity identified it as proximate. It should be sufficient to apply a fault at the entity’s own applicable substation and then take the outage of both the	

applicable and proximate substations. There would be no need for duplicate fault studies, yet notifications to other entities are not required until R7 is reached. BPA believes Transmission Owners would have difficulties obtaining and validating information required for proximate Transmission stations or substations. BPA recommends adding language to facilitate coordination among varying entities to ensure data can be received and validated. R3.4 contains a reference to Part 3.3.2, but there is no such Part in the current redlines. This seems to result in the omission of proximate substations from R3.4, and it is unclear if this is an intentional omission.

Response	
Thank you for your comments. Drafting team is aware that coordination is needed and necessary. Part 3.3.2 has been labled now.	
Stephen Stafford - Stephen Stafford On Behalf of: Greg Davis, Georgia Transmission Corporation, 1; - Stephen Stafford	
Answer	No
Document Name	
Comment	
Developing steady-state and dynamic simulation criteria is a planning function and should not be required of a Transmission Owner. The sub-requirements go further into addressing what a transmission planning study should include but applies this requirement incorrectly to the Transmission owner. The intent of R3 is more appropriately applicable to the TPL body of standards. CIP-014 should reference output from a study performed in accordance with a clearly defined TPL requirement for an extreme event involving the loss of an applicable Transmission station(s) or substation(s).

3.1 - The second sentence of R3.1 appears to be deficient. There is no reasonable requirement for the thresholds (e.g., technical justifications). Further, consideration of the thresholds should only be one piece of the analysis, not all of it. R3.3.1 should also take into consideration the stability of the system before the thresholds are met. 3.4 - Consider clear indication of what kind of fault needs to be applied, i.e., a three phase to ground bolted fault or a single line to ground fault. 3.4.2 and 3.4.3 - Consider updating language that actual or more conservative clearing times shall be used and if not available, delayed (remote) clearing times are acceptable.	
Likes 0	
Dislikes 0	
Response	
Thank you for your comments and suggestions. The drafting team wants to leave the thresholds for the registered entities to define. Every region is different, as long as the thresholds can be justified, the Requirement would be made. The drafting team added “technically justified” in Part 3.1. There is no bright-line. Same reason for the type of fault needs to be studied. The actual clearing time is always available. The registered entities can use more conservative clearing time as an option.	
Andrew Smith - APS - Arizona Public Service Co. - 5

Comment	
It's unclear whether the generation or load loss criteria will simply have specific MW thresholds for generation loss and load loss in the overall interconnected system, or define generation and load loss thresholds both inside and outside of a Planning Coordinator area (but within the overall Interconnection). Consideration could be given to adding a net loss criterion in cases where both generation and load are lost. When the loss of generation and load are of the same order there are typically minimal impacts on the Interconnection

1) Quantifying “Unacceptable Loss” and “Conservative Clearing Time” (R3.1 &R3.4) - The phrases “unacceptable generation and load loss” in R3.1 and “actual or more conservative clearing time” in R3.4 are inherently subjective and open to regional interpretations. To promote uniform implementation, PGAE recommends that NERC establish quantitative default benchmarks for generation and load loss thresholds, and a clearing time margin. Including such reference values—while still allowing entities to justify alternative criteria based on system characteristics—will align CIP-014-4 with the measurable approach used in the NERC TPL standards and reduce the potential for inconsistent compliance findings across regions. 2) Clarification on R3.4- Assumption of Total Loss of Communication and Protection Systems – PGAE recommends clarifying the required assumptions for the simultaneous loss of “all communication and protection systems” in R3.4. Defining the expected modelling approach, preferably with an example one line and timing table, will allow entities to build studies that are both realistic and comparable, avoiding unnecessary burden while meeting the standard’s risk reduction objectives

Every region is different, as long as the thresholds can be justified, the Requirement would be made. The drafting team added “technically justified” in Part 3.1. The drafting team made modification to Requirement R4, Part 3.4 and clarified that loss of communication does not apply to the proximate stations.	
Isidoro Behar - Long Island Power Authority - 1	
Answer	No
Document Name	
Comment	
Req 3.4 – This requirement states:	

"A specification that Fault simulations assume the loss of communication and Protection Systems at the applicable Transmission station(s) or Transmission substation(s) prior to or simultaneous with the Fault(s) studied under Requirement R3, Parts 3.3.1 and 3.3.2." It is not clear if the loss of communications and Protection Systems would apply to the proximate station (and thus an affected entity would have to make an assumption). We request clarification that the loss of communications and Protection Systems only applies to the **applicable stations** identified based on Req #1 (and not to the proximate stations identified based on Req #2). Question for clarification: If the loss of communications and Protection Systems does NOT apply to the proximate stations identified based on Req #2, then is it permissible to assume local high speed protection system clearing times for the fault **at the proximate station?**

Josh Schumacher - Black Hills Corporation - 6, Group Name Black Hills Corporation Segments 1, 3, 5, 6	
Answer	No
Document Name	
Comment	
Black Hills Corporation agrees with EEI's comments about seeking clarification around the use of numbering vs bullet points in Requirement R3 Part 3.3 and Part 3.4. Generally, bullet points can be considered "OR" requirement and numbered items are treated as "AND" requirements. There are also references to numbered items that don't exist in the current clean version of the document, for example Part 3.4 references Requirement R3 Parts 3.3.1 and 3.3.2, which do not exist in this version of the draft.	

Additionally, we agree with EEI's concerns about Requirements R3 Part 3.1 and how it might create scenarios where entities must rely on another party to provide the information necessary to establish and maintain the unacceptable thresholds for generation and load loss within an Interconnection. We agree with EEI's comments to remove some language from requirement R3 Part 3.1 and include it in the technical rationale on how to establish and maintain thresholds.	
Likes 0	
Dislikes 0	
Response	
Thank you for your comments and suggestions. The bullets have been replaced by numbers because it's an "and", not "or". The drafting team also added "technically justified" in Part 3.1 to clear the threshold concern.	
Jodi Yeary - AEP - 3	
Answer	No
Document Name	
Comment	
AEP is supportive of specifying that more than one scenario shall be studied but would like flexibility in choosing what factors are varied between scenarios. Also the draft currently mixes subrequirements with bullets which should be corrected: In the clean version of CIP-014-4 that is posted, there are bullet points under Requirement R3 Part 3.3 and 3.4, but Part 3.4 references Requirement R3 Parts 3.3.1 and 3.3.2, which do not exist in this draft. The Redline to Last Posted document includes a Requirement R3 Part 3.3.1 followed by a bullet point, but no Part 3.3.2. The Redline to Last Posted version also includes Requirement R4 Parts 3.4.1-3.4.3 instead of the bullet points that are in the clean version under 3.4.

Thank you for your comments and suggestions. The bullets have been replaced by numbers because it's an "and", not "or".	

Brian Millard - Tennessee Valley Authority - 1,3,5,6 - SERC, Group Name TVA RBB	
Answer	No
Document Name	
Comment	

R3.2: TVA suggests reverting back to the prior draft of this language that is less prescriptive for what cases are more likely to contribute to instability, uncontrolled separation, or Cascading within an Interconnection.

TVA proposes revise R3.2 as follows: "Steady-state and dynamic simulations shall each be performed using:

(1) A peak-season and an off-peak season, or,

(2) Two different peak-seasons (e.g., summer and winter peak)"

Likes 0	
Dislikes 0	
Response	

Thank you for your comments. The drafting team added "at least" in Part 3.2. Drafting team believes that a System peak Load case and a System Off-Peak Load case are necessary. Registered entities may use additional options if they like.

Dave Krueger - SERC Reliability Corporation - 10	
Answer	No
Document Name	
Comment	

SERC appreciates the ongoing efforts to refine the CIP-014 Risk Assessment portion of the standard.

SERC believes that each Interconnection Planning Collaborative should establish the maximum generation and load loss thresholds for its respective Interconnection. Allowing each Transmission Owner to establish their own thresholds creates inconsistency for identifying which events cause instability, uncontrolled separation, or Cascading within an Interconnection.

SERC believes that the use of the single word 'Fault', does not provide clarity and consistency in the requirement. The fault type should be stated as a 3-phase Fault to align with how Extreme events are studied in TPL-001-5.1.	
Likes 0	
Dislikes 0	
Response	
Thank you for your comment. Drafting team agrees that 3-phase fault is generally most severe fault. However, there are situations other type of faults could be more severe.

Mark Flanary - Midwest Reliability Organization - 10	
Answer	No
Document Name	
Comment	
For R3.3, the use of the term "Fault" opens the door to the usage of less severe faults. We recommend changing "Fault" to "a Fault that will cause the most severe consequences at that substation" to ensure the most serious scenario is studied. The Standard need not specify what fault is to be used in the study, but the Entity would identify what the most serious Fault is and study that.

Thank you for your comment. Drafting team agrees that 3-phase fault is generally most severe fault. However, there are situations other type of faults could be more severe.	
Jamison Cawley - Nebraska Public Power District - 1	
Answer	No
Document Name	
Comment	
There appears to be no technical basis to support the inclusion of prior outage scenarios involving communication systems and the ability to assume simultaneous loss of the comm system with the disturbance is also an option here which introduces subjectivity to the process. Including prior outage scenarios in the Risk Assessment (RA) could include prior outages of generators, lines, transformers and other	

substation equipment which adds further ambiguity to the RA process. The requirement to use delayed clearing times cannot be technically justified for certain protection schemes (DCUB) and the TO should have the ability to use their extensive experience in this area versus a requirement to assume delayed clearing times.

Defining a fixed MW value for generation or load loss should not be required if the assessment does not conclude that it would risk instability, uncontrolled separation or Cascading. This could result in a scenario where costly additional security measures are shifted to the entity and its customers for an event that crossed the MW threshold but did not cause instability or Cascading in the assessment.

Kristine Martz - Edison Electric Institute - NA - Not Applicable - NA - Not Applicable	
Answer	No
Document Name	
Comment	

EEI seeks clarification on the drafting team's intention for Requirement R3 Part 3.3 and Part 3.4 sub-requirements. In the clean version of CIP-014-4 that is posted, there are bullet points under Requirement R3 Part 3.3 and 3.4, but Part 3.4 references Requirement R3 Parts 3.3.1 and 3.3.2 which do not exist in this draft. The Redline to Last Posted document includes a Requirement R3 Part 3.3.1 followed by a bullet point, but no Part 3.3.2. The Redline to Last Posted version also includes Requirement R4 Parts 3.4.1-3.4.3 instead of the bullet points that are in the clean version under 3.4. The numbers vs. bullets are important to understand because generally, numbered items are treated as "and" requirements, and bulleted lists can be interpreted as "or" requirements.

Additionally, EEI is concerned about the requirement to specify thresholds identifying unacceptable generation and load loss within an Interconnection in Requirement R3 Part 3.1. In some scenarios entities rely on another party to provide the information necessary to establish and maintain these thresholds. EEI suggests striking the sentence "The criteria shall include, at a minimum, thresholds identifying unacceptable generation and load loss within an Interconnection" from Requirement R3 Part 3.1 and including it in the technical rationale with details on how to establish and maintain the thresholds.

Thank you for your comment. Please see the response to the EEI's comments. The Requirement does not require to run faults at multiple substations. It's "A" typical fault.	

Kelley Sargent - Puget Sound Energy, Inc. - 3	
Answer	No
Document Name	
Comment	

3.1 Thresholds for Unacceptable load or generation loss within an interconnection: It will be helpful if WECC provides thresholds for unacceptable load loss and generation loss that may impact the interconnection. Lack of specific criteria from WECC will lead to inconsistency in CIP-14 assessment methodology among members.

3.3 It will be helpful if standard can clarify if the fault is 3 Phase or single phase.

3.4.2 & 3.4.3 Clearing times: It is not clear if Delayed (remote) clearing times or Actual (more conservative) clearing times shall be used. Does the standard allow both? The technical rationale document for CIP 14-4 (pg. 4) seems to indicate that actual or more conservative clearing times are required. If so, 3.4.2 should be removed.

Response	

Thank you for your comments. A coordination is assumed with Regional Enities or RCs. Some public documents should have the thresholds listed for different regions.

The drafting team does not want to specify the type of faults, because some faults are more severe than others depending on the scenario.

Both delayed (remote) clearing times and Actual (more conservative) clearing times should be used for applicable stations from R1, not for R2 proximate stations.

See attached for recommendations and rationales. R3 Each Transmission Owner who has identified stations or substations in accordance with R1, shall have a documented risk assessment methodology that further refines the R1 list to by utilizing electrical performance testing for evaluation of system performance due to a physical attack. A refined list of identified	

stations or substations will result where system performance does not meet criteria. The methodology shall include the following: [Violation Risk Factor: High; Time-Horizon: Long-term Planning]

3.1. Documented criteria for assessing system instability, uncontrolled separation, or Cascading within an Interconnection.

3.2. An electrical performance test employing steady-state and/or dynamic simulations performed under System Peak and/or System Light load conditions that are more likely to contribute to instability, uncontrolled separation, or Cascading within an Interconnection.

3.3. A test that involves an electrical fault at the station or substation whereby all elements connected at voltage levels 200 kV and above are removed from service.

3.4 The system performance result of this electrical fault (R3.3) to be compared against criteria established in R3.1 for any case or simulations employed in R3.2.

Make an Attachment 2: Sample Procedure for Electrical Testing: e.g.

- If dynamic simulations show acceptable system response but additional Elements trip during the dynamic simulation of an event, then additional steady-state analysis including any tripped Elements from the dynamic simulations shall be conducted.
- A specification that Fault simulations that assume the loss of communication and Protection System for the station or substation under test
- Removal of all Elements that Protection Systems and other controls are expected to automatically disconnect for each event.
- Delayed (remote) clearing times shall be used unless otherwise technically substantiated.

- Actual or more conservative estimates of clearing times.
- The simulations shall include the removal of all Elements that Protection Systems and other controls are expected to automatically disconnect for each event.

Jennie Wike - Jennie Wike On Behalf of: John Merrell, Tacoma Public Utilities (Tacoma, WA), 1, 4, 5, 6, 3; - Jennie Wike, Group Name Tacoma Power

Answer	No
Document Name	

Comment

Tacoma Power is concerned with using bullets for the sub-items in R3.3. Instead of using bullets, these sub-items should be numbered as 3.3.1 and 3.3.2 to ensure that both are required. Bullets are used to indicate an "or" relationship. Additionally, the language in the lead-in statement of R3 should be revised to include proximate stations and substations to ensure it's clear that both should be considered.

Proposed revision to R3:

"R3. Each Transmission Owner shall have a documented risk assessment methodology for evaluating the loss of each applicable Transmission station or Transmission substation identified in Requirement R1, **and any associated proximate Transmissions stations or Transmission substations identified in Requirement R2**. The methodology shall include, at a minimum, the following:

3.3. A specification for Fault simulations, including:

3.3.1. For each applicable Transmission station or Transmission substation listed in accordance with Requirement R1, a Fault at the applicable Transmission station or Transmission substation. **3.3.2.** For each Transmission station or Transmission substation determined in accordance with Requirement R2 as being in proximity to an applicable Transmission station or Transmission substation, Faults at both the applicable and proximate Transmission station(s) or Transmission substation(s).” Tacoma Power recommends swapping the order of R3 and R4. The Requirement R4 actions should occur prior to documenting the methodology. Also, there’s an inconsistency between the CIP-014-4 clean version and redline files. The redline to last approved file shows 3.3.1 and 3.3.2 instead of bullets. The redline to last posted file shows 3.3.1 and a bullet. The clean version has only bullets under R3.3.

MRO NSRF recommends reinstating the option to use more conservative estimates vs. actual clearing times in the last bullet of R3.4. If an Entity wishes to use conservative estimates of clearing times rather than calculate every actual clearing time, an auditor can sample and ask for justification. If the actual clearing time is found to be longer than the estimate the auditor would ask for the study to be re-run with the actual clearing time, which may or may not change whether a Transmission station or substation is identified. Registered Entities should have the latitude to use engineering judgement where they think it is warranted. More importantly, if a conservative estimate of clearing times results in the study identifying a Transmission station or substation, there is no need to re-run the study with actual clearing times. This could save system protection personnel significant time and effort calculating unneeded actual clearing times

While Exelon agrees the modifications in the new Requirement R3 address the issues identified in the SAR, we do suggest the following enhancements. The sub-requirement R3.1 minimum requirement for thresholds identifying unacceptable generation and load loss within an Interconnection would benefit from additional clarification and guidance. For example, perhaps data regarding frequency response to loss of generation and loss of load could act as guidance for entities to establish these thresholds. To reduce the burden on smaller TOs of developing an R3 methodology and performing the R5 planning studies, consider providing an option for entities to use the list of transmission stations or substations obtained from the Attachment 1 analysis, as the input to R7 for primary control center determination, and as the input to R8 to begin the physical attack evaluation. Attachment 1 would therefore be an option as the R3 methodology that would then be applied in R5. R4 would still be required. The R6 third party review would be limited to a review of the Attachment 1 analysis.

Texas RE is still concerned the proposed Requirement Part 3.3 language does not specify the type of fault conditions (line-to-ground fault or three-phase fault) criteria that needs to be studied. If the language will not be added to the requirement, Texas RE requests the Technical Rationale specify whether single-line-to-ground faults or three-phase-to-ground faults are to be included in the simulations, to ensure consistency and clarity in fault analysis across entities.	
Likes 0	
Dislikes 0	
Response	
Thank you for your comments. Drafting team believes that 3-phase fault is generally most severe fault. However, there are situations other type of faults could be more severe. The drafting team can add more language on simulations in the Technical Rationale document.	

4. Do you agree with the modifications made in CIP-014-4 with new Requirement R4 to address the issues identified in the SAR? If you do not agree, please provide your recommendation and, if appropriate, technical or procedural justification.

Oncor appreciates the SDT's response to Oncor's previous comment in the last draft, which affirmed that each TO may prepare its own risk assessment of the subject station and may use its own methodology. Oncor also appreciates the SDT's clarification that, in the event agreement cannot be reached, each TO is able to justify its results using its own supporting evidence. To ensure this intent of the SDT is clearly conveyed, Oncor believes it would be beneficial to include this clarification directly in Requirement R4 language. Accordingly, Oncor recommends the following addition to Requirement R4: Each Transmission Owner with applicable Transmission station(s) and Transmission substations(s) identified in Requirement R1 containing Bulk Electric System (BES) Elements owned by multiple Transmission Owners shall coordinate with each appropriate Transmission Owner(s)	

to determine and document their individual and joint responsibilities for documenting a risk assessment methodology under Requirement R3 and for performing any required risk assessments per Requirement R5. ***In the event that coordination of individual and joint responsibilities cannot be achieved for documenting a risk assessment methodology under Requirement R3 and for performing any required risk assessments per Requirement R5, each Transmission Owner shall document and justify its own risk assessment using its own methodology and evidence.***

ITC suggests either the removal of or the following revision to Requirement R4: R4. Each Transmission Owner with applicable Transmission station(s) and Transmission substation(s) identified in Requirement R1 containing Bulk Electric System (BES) Elements **greater than 200 kV or identified as part of an IROL or essential to meeting an NPIR** owned by multiple Transmission Owners shall coordinate with each appropriate Transmission Owner(s) to determine and document their individual and joint responsibilities for documenting a risk assessment methodology under Requirement R3 and for performing any required risk assessments per Requirement R5. R4 is administrative requiring documentation for all joint stations. Many joint stations have existed for decades where the two entities have an understanding of who is responsible for what parts of compliance. When documentation is being required, many entities legal groups will feel a need to be involved making this both time consuming and costly.

Comment	

TVA supports coordination among joint owners as an important goal. However, the proposed language essentially introduces a major coordination burden, and it assumes a level of entity collaboration, timing, and methodological alignment. It also raises a compliance risk for one entity being dependent on the responsiveness and practices of another.

TVA suggests modifying the draft language to provide flexibility and protects compliant TOs from being penalized for other's inaction(s), as follows:

"Each Transmission Owner with applicable Transmission station(s) and Transmission substation(s) identified in Requirement R1 containing Bulk Electric System (BES) Elements owned by multiple Transmission Owners shall coordinate with those each appropriate Transmission Owner(s) to determine and document their individual responsibilities for documenting a risk assessment methodology under Requirement R3 and for performing any required risk assessments per Requirement R5."

Or…

"Each Transmission Owner with applicable Transmission station(s) and Transmission substation(s) identified in Requirement R1 containing Bulk Electric System (BES) Elements owned by multiple Transmission Owners shall coordinate with those each appropriate Transmission Owner(s) to determine and document their individual responsibilities for documenting a risk assessment methodology under Requirement R3 and for performing any required risk assessments per Requirement R5. In cases where agreement is not achieved, each Transmission Owner shall independently assess and document its own responsibilities and the basis for any assumptions regarding joint ownership impacts."

As a general comment, Req# 4 needs to be reviewed in detail to ensure clarity and to ensure clear compliance responsibilities.

Req #4 states:

"Each Transmission Owner with applicable Transmission station(s) and Transmission substation(s) identified in Requirement R1 containing Bulk Electric System (BES) Elements owned by multiple Transmission Owners shall coordinate with each appropriate Transmission Owner(s) to determine and document their individual and joint responsibilities for documenting a risk assessment methodology under Requirement R3 and for performing any required risk assessments per Requirement R5."

Req #4 now requires a Transmission Owner to DOCUMENT which TO is responsible for DOCUMENTING specific portions of the risk assessment methodology (RAM). In the previous version of the standard, it only asked TOs to document who is responsible for PERFORMING the risk assessment methodology, but now it must be explicitly outlined who is responsible for even DOCUMENTING parts of that RAM. We would like to point this out so that the SDT can verify if "documenting" individual and joint responsibilities for "documenting" a risk assessment methodology is part of the intent of this revised requirement.

Based on the Technical Rationale, the inclusion of "BES Elements" appears to reference the addition of jointly owned Transmission stations and Transmission substations in the Applicability section. However, introducing the term "BES Elements" creates confusion by shifting the focus to individual elements rather than the applicable Transmission stations and substations.

Req #4 specifically addresses facilities (BES Elements) with joint ownership to coordinate/collaborate. One improvement would be to include Transmission Owners whose stations have been identified as part of Req #2 to also be included in this requirement to coordinate. The ownership of the applicable and proximate stations may be different, and thus we feel the concept of coordination with respect to Req #2 should apply.

We note that there are various possibilities with respect to ownership and to what stations may be considered applicable versus proximate. It is noted that an applicable station owned by one TO may also be considered a proximate station from the perspective of another TO that owns an adjacent applicable station (and vice versa; a proximate station from the perspective of a TO may also be considered an applicable station by another TO).

FirstEnergy supports EEI comments which state: R4. Each Transmission Owner with applicable Transmission station(s) and Transmission substation(s) identified in Requirement R1 containing Bulk Electric System (BES) Elements **greater than 200 kV or identified as part of an IROL or essential to meeting an NPIR** owned by multiple Transmission Owners shall coordinate with each appropriate Transmission Owner(s) to determine and document their individual and joint responsibilities for documenting a risk assessment methodology under Requirement R3 and for performing any required risk assessments per Requirement R5. EEI also asks the drafting team to consider adding content to the Technical Rationale describing how an entity can prove that they do not have anyone to coordinate with because there are no jointly owned Transmission station(s) or Transmission substation(s).

The requirement is appropriate in the context that the referenced risk assessment is from a physical security perspective and not a transmission planning analysis perspective. Should the intent of this comment be applicable to physical security and not a transmission planning analysis, then our answer would be yes.

Southern Company agrees with Requirement R4 with the below suggestion for consideration:

The removal of including “documentating a risk assessment methodology under Requirement R3”. This is redundant since any Transmission Owner performing Requirement R5 must have a risk assessment methodology for the stations being assessed per Requirements R1, R2, and R4.

R4.
Each Transmission Owner with applicable Transmission station(s) and Transmission substation(s) identified in Requirement R1 containing Bulk Electric System (BES) Elements owned by multiple Transmission Owners shall coordinate with each appropriate Transmission Owner(s) to determine and document their individual and joint responsibilities for documenting a risk assessment methodology under Requirement R3 and for performing any required risk assessments per Requirement R5.

Thank you for your comments. At the end of the 36-month period the entity must have the Risk Assessment completed.	
Ronald Hoover - Bonneville Power Administration - 1,3,5,6 - WECC	
Answer	No
Document Name	
Comment	
BPA believes R5 is missing a requirement to coordinate in order to ensure data from proximate Transmission stations and sub-stations can be obtained and validated. Without a requirement to coordinate, BPA believes there would be difficulty identifying the Primary Control Center operationally controlling the proximate Transmission stations and sub-stations. BPA also recommends adding language to R5 to clarify how a Registered Entity should address negative responses from proximate substation owners.

There is no issue with performing a risk assessment every 36 months. However, Transmission Owners are not the appropriate registered entity to conduct planning analyses. Nor are the CIP standards the appropriate place to document planning analysis requirements. Planning studies should be governed within the TPL group of standards.

FirstEnergy asks for clarification of responsibilities toward R5 - specifically as realted to unregistered DERs and IBRs.

FirstEnergy also supports EEI's comments which state:

EEI suggests the following revisions to Requirement R5.

The revised draft CIP-014-4 Requirement R5 includes a new statement: "If proximate Transmission station(s) and Transmission substation(s) were identified in Requirement R2, they should also be

included in the risk assessment." The word "should" could be interpreted as a recommendation instead of a mandatory requirement.

Additionally, by referring to "proximate Transmission station(s) and Transmission substation(s)… identified in Requirement R2" in Requirement R5, all identified proximate Transmission station(s) and Transmission substation(s) would be subject to Requirements R8-R10, not just those that are applicable.

If it is the intention of the drafting team to require applicable proximate Transmission station(s) and Transmission substation(s) to be included in the Requirement R5 risk assessment, EEI suggests the following:

R5. At least once every 36 calendar months, each Transmission Owner shall perform a risk assessment to identify applicable Transmission station(s) and Transmission substation(s) identified in Requirement R1, that if rendered inoperable or damaged could result in instability, uncontrolled separation, or Cascading within an interconnection, using the methodology established in Requirement R3, including any Transmission station(s) and Transmission substation(s) identified in accordance with Requirement R4.

EEI also asks the drafting team to consider adding information to the technical rationale discussing scenarios where a new risk assessment demonstrates that a substation is no longer applicable to CIP-014, but a previous physical security plan includes security measures with future due dates. The technical rationale could include discussion of actions to take when security measures are no longer required for the de-classified transmission substation(s).

Likes 0	
Dislikes 0	

Response
Thank you for your comment. Please see responses to the EEI's comments. This Standard does not apply to unregistered DERs and IBRs. The Requirement was modified. Proximate stations only should be assessed per Requirement R3, Parts 3.3.2 and 3.5. "Should" was replaced by "shall". Technical Rationale document will be revised as suggested before posting.

David Melanson - NB Power Corporation - New Brunswick Power Transmission Corporation - 5

Comment	

MPC strongly disagrees with the use of a 36-month timeframe for utilities who have not previously identified any Transmission stations or substations as critical as it will lead to increased study costs with little or no benefit to the reliability of the BES. Instead, MPC proposes retaining the requirement to perform a risk assessment every 60 months for TOs that have not previously identified applicable Transmission stations or substations, and include Transmission station(s) and Transmission substation(s) planned to be in service within 60 calendar months.

SAR objective number 2 states a goal for this project is to "correct any discrepancies between the study period, frequency of study, and the base case(s) a Transmission Owner uses." This is the basis for the SDT's justification to change the risk assessment timeframe from 60 months for TOs without applicable Transmission stations or substations to 36 months for all TOs without exception. Further, the Technical Rationale states the change to 36 months was to align the CIP-014 risk assessment with the annual model build time frame of Standard TPL-001. Because the CIP-014 analysis does not depend on the models built for TPL-001, MPC believes changing the risk assessment time frame to align with the TPL-001 model build process does not provide benefit to the CIP-014 analysis. Additionally, the existing 60 month timeframe for TOs without applicable Transmission station(s)/substation(s) still aligns with the 12-month model build timeframe of the TPL-001 standard.

MPC continues to hold the position that given the very slow pace of construction of new electrical infrastructure due to increased equipment lead times, supply chain constraints, and labor shortages, it is highly unlikely that a modification to an existing non-critical station or substation that would result in the station or substation becoming critical would be planned, designed, and constructed within 36 months. It is equally unlikely that a newly constructed CIP-014 critical (sub)station would be completed within this timeframe. As stations and substations planned to be in service within 24 months of the risk assessment are already required to be included under R1 of CIP-014-3, changing the risk assessment timeframe from 60 months to 36 months is very unlikely to identify new Transmission stations or substations that would not be identified under CIP-014-3.

For utilities who have not identified previously identified (sub)stations as critical, moving the risk assessment timeframe from 60 calendar months to 36 calendar months will result in increased costs due to more frequent risk assessments, with the more frequent assessments having no BES reliability benefit as they have little to no chance of identifying stations or substations as CIP-014 critical that would not already have been under the CIP-014-3.

Response	
Thank you for your comments. The drafting team does not agree with MRC's interpretation on "correct any discrepancies between the study period, frequency of study". Also, 36 calendar months is a long period for not looking at one's system. A lot of things could have changed during 36 calendar months.	
Isidoro Behar - Long Island Power Authority - 1	
Answer	No
Document Name	
Comment	

In general, we recommend that the wording in the main requirement section of Req #5 be reviewed in detail for clarity.

Requirement #5 states:

"*At least once every 36 calendar months, each Transmission Owner shall perform a risk assessment to identify applicable Transmission station(s) and Transmission substation(s) identified in Requirement R1, that if rendered inoperable or damaged could result in instability, uncontrolled separation, or Cascading within an Interconnection, using the methodology established in Requirement R3, including any Transmission station(s) and Transmission substation(s) identified in accordance with Requirement R4. If proximate Transmission station(s) and Transmission substation(s) were identified in Requirement R2, they should also be included in the risk assessment*."

a) This requirement introduces the concept of "*that if rendered inoperable or damaged*". While the verbiage **"that if rendered inoperable or damaged"** may be introduced within the Technical Rationale, this verbiage is confusing when reading Req #5 – and as such it is recommended to correlate what is meant by "that if rendered inoperable or damaged" within Requirement #3 (or introduce this concept within the Req #3). Requirement #3 mentions "the loss of each applicable Transmission station or Transmission substation identified in Requirement R1" – with no mention or correlation of "loss of each station" to "that if rendered inoperable or damaged".

b) The verbiage states "using the methodology established in Requirement R3, including any Transmission **station(s)** and Transmission **substation(s)** identified in accordance with Requirement R4". However, as written, Req #4 relates to the coordination with respect to "**Bulk Electric System (BES) Elements** owned by multiple Transmission Owners". As written, Req #4 does not identify "stations".

c) The verbiage states "If proximate Transmission station(s) and Transmission substation(s) were identified in Requirement R2, they **should** also be included in the risk assessment."

This implies that the inclusion of proximate stations in the risk assessment is optional. If this is a requirement, the term "should" should be replaced by "shall".

d) The verbiage states "If **proximate** Transmission station(s) and Transmission substation(s) were identified in Requirement R2, they **should** also be included in the risk assessment." This requirement is not clear and needs clarification.

- This wording contradicts with the wording in Req #3 which states: "*Each Transmission Owner shall have a documented risk assessment methodology for evaluating the loss of each **applicable** Transmission station or Transmission substation identified in Requirement R1.*"
- Does this mean that requirements 7 through 10 apply to proximate stations if the fault on the proximate station leads to instability, uncontrolled separation, or Cascading within an Interconnection?
- For proximate stations, it is required to identify them and apply a fault on them. For the risk assessment, what specifically needs to be done for the proximate stations?

e) Please clarify whether, at the end of the 36-month period, the entity is required to have initiated or completed the Risk Assessment. We recommend separating the operational assessment and security assessment into distinct components within the timeline to reduce confusion, rather than referring to both collectively as the "risk assessment."

Likes 0	
Dislikes 0	

Response
Thank you for your comments. The Standard has been modified to clarify some of your concerns. The phrase “that if rendered inoperable or damaged” is in the existing approved version of CIP-014. It is generally understood by the industry. “BES” has been removed from Requirement R4. “Should” has been replaced by “shall”. R7 through R10 only apply to the applicable stations on the critical list which are verified by the third party (R6). Please see Requirement R3, Parts 3.3.2 and 3.5 and associated Technical Rationale document for assesspent on proximate stations. At the end of the 36-month period, the entity is required to have completed the Risk Assessment.
Josh Schumacher - Black Hills Corporation - 6, Group Name Black Hills Corporation Segments 1, 3, 5, 6

Answer	No
Document Name	

Comment
Black Hills Corporation agrees with EEI’s recommended changes to the language in Requirement R5. This change makes it clear which proximate Transmission stations and Transmission substations should be included in the scope for all requirements. The current language could cause confusion as to which proximate Transmission station/substations need to be included for each requirement, thus expanding the scope of the standard further than is intended. Black Hills Corporation also agrees with EEI’s suggestion to add information to the technical rationale for scenarios where a risk assessment demonstrates a previously applicable substation no longer is, and what actions to take when security measures are no longer required for a specific substation.

R5. Please clarify whether, at the end of the 36-month period, the entity is required to have initiated or completed the Risk Assessment. NPCC RSC recommends separating the operational assessment and security assessment into distinct components within the timeline to reduce confusion, rather than referring to both collectively as the "risk assessment." In the final sentence of R5, the phrase "they should also be included in the risk assessment" raises a question: does this imply that proximate Transmission station(s) and Transmission substation(s) are optional in the risk assessment?	
Likes 0	
Dislikes 0	
Response	
At the end of the 36-month period, the entity is required to have completed the Risk Assessment. Only Requirement R3, Parts 3.3.2 and 3.5 are in scope for R5, not the whole assessment. .

“Rendered inoperable” should be eliminated from this standard. This term has no definition and leads the RE to move toward a requirement to study the “Smoking Crater” scenario. There has been no documented “Smoking Crater” scenario documented on US soil at a BES substation and to force TO’s to develop fault scenarios for an unrealistic event is unreasonable.

Recommend removing “including any Transmission station(s) and Transmission substation(s) identified in accordance with Requirement R4. If proximate Transmission station(s) and Transmission substation(s) were identified in Requirement R2, they should also be included in the risk assessment.” from R5. Rational for removing: This language is redundant because the inclusion of proximate substations within the risk assessment methodology is already established by the previous Requirements (R2 and R3.3.2) and therefore will inherently be included in the risk assessment. Adding this to Requirement R5 could potentially add confusion. Proximate substations, irrespective of ownership, must be included in the risk assessments; but Requirement R5 is talking about performing the risk assessment and identifying the applicable stations (owned by the TO performing the Risk Assessment) from Requirement R1 that could result in instability, uncontrolled separation, or Cascading within an Interconnection… Proximate substations owned by different TOs could have different Methodologies. A proximate substation not owned by the TO performing the risk assessment cannot be identified as “critical – that if rendered inoperable or damaged could result in instability, uncontrolled separation, or Cascading” by that TO, even though the proximate substations will be included within the risk assessment based on Requirements R2 and R3. If this redundant language isn’t removed, it could add confusion around this. The language pointing back to Requirement R4: “...including any Transmission stations(s) and Transmission substation(s) identified in accordance with Requirement R4.” is also not needed and redundant. It doesn’t add confusion in the way the reference back to proximate substations does, but it is still unnecessary. Requirement R4 talks about coordinating the responsibilities if there are BES Elements owned by multiple TOs within a substation already identified in Requirement R1. **The list of substations identified by Requirement R1 are the “superset” and therefore all that is needed in Requirement R5 is point back to R1** (not R4).

EEI suggests the following revisions to Requirement R5.

The revised draft CIP-014-4 Requirement R5 includes a new statement: "If proximate Transmission station(s) and Transmission substation(s) were identified in Requirement R2, they should also be included in the risk assessment." EEI suggests removing this sentence because Requirement R5 already requires TOs to perform a risk assessment using the methodology established in Requirement R3, and Requirement R3 part 3.3.2 includes Transmission station(s) and Transmission substation(s) determined in accordance with Requirement R2 as being in proximity to an applicable Transmission station or Transmission substation.

Additionally, including a separate reference to "proximate Transmission station(s) and Transmission substation(s)… identified in Requirement R2" in Requirement R5, could be confused for an expansion in scope because, as written, the reference is to identified proximate Transmission station(s) and Transmission substation(s) in Requirement R2, not those that are identified through the performance of the Requirement R5 risk assessment. The scope of Requirement R5 is important because of its tie to Requirements R8-R10.

EEI suggests the following:

R5. At least once every 36 calendar months, each Transmission Owner shall perform a risk assessment to identify applicable Transmission station(s) and Transmission substation(s) identified in Requirement R1, that if rendered inoperable or damaged could result in instability, uncontrolled separation, or Cascading within an interconnection, using the methodology established in Requirement R3, including any Transmission station(s) and Transmission substation(s) identified in accordance with Requirement R4.

EEI also asks the drafting team to consider adding information to the technical rationale discussing scenarios where a new risk assessment demonstrates that a substation is no longer applicable to CIP-014, but a previous physical security plan includes security measures with future due dates. The technical rationale could include discussion of actions to take when security measures are no longer required for the de-classified transmission substation(s).

For 5.1, failure to perform the entirety of the risk assessment could have an TO not completing either the stability of steady state portion of the study. If the third party reviewer identified a mistake in the piece of the study that was completed, they have nothing to verify for the second half of the study as it was not performed. Changes to the system which add resiliency to the system may have changed a previous critical station to a non-critical station. Not studying it going forward means that the costs would continue to be incurred for protecting a station that does not require it. ITC also suggests the following revisions to Requirement R5. The revised draft CIP-014-4 Requirement R5 includes a new statement: “If proximate Transmission station(s) and Transmission substation(s) were identified in Requirement R2, they should also be included in the risk assessment.” EEI suggests removing this sentence because Requirement R5 already requires TOs to perform a risk assessment using the methodology established in Requirement R3, and	

Requirement R3 part 3.3.2 includes Transmission station(s) and Transmission substation(s) determined in accordance with Requirement R2 as being in proximity to an applicable Transmission station or Transmission substation. Additionally, including the separate reference to "proximate Transmission station(s) and Transmission substation(s)… identified in Requirement R2" in Requirement R5, could be confused for an expansion in scope because, as written, the reference is to identified proximate Transmission station(s) and Transmission substation(s) in Requirement R2, not those that are identified through the performance of the Requirement R5 risk assessment. Furthermore R4 should not be included in R5. Only stations identified in R1 need to be reviewed to determine if they are jointly owned. R4 should only identify those stations identified in R1 that an entity would no longer need to study as the other joint owner will be performing it. The scope of Requirement R5 is important because of its tie to Requirements R8-R10. ITC suggests the following: R5. At least once every 36 calendar months, each Transmission Owner shall perform a risk assessment to identify applicable Transmission station(s) and Transmission substation(s) identified in Requirement R1, that if rendered inoperable or damaged could result in instability, uncontrolled separation, or Cascading within an interconnection, using the methodology established in Requirement R3, excluding any Transmission station(s) and Transmission substation(s) identified in accordance with Requirement R4 to be reviewed by the entity identified in R4.. If proximate Transmission station(s) and Transmission substation(s) were identified in Requirement R2, they should also be included in the risk assessment."

As stated in our response to Questions 3 above: To reduce the burden on smaller TOs of developing an R3 methodology and performing the R5 planning studies, consider providing an option for entities to use the list of transmission stations or substations obtained from the Attachment 1 analysis, as the input to R7 for primary control center determination, and as the input to R8 to begin the physical attack evaluation. Attachment 1 would therefore be an option as the R3 methodology that would then be applied in R5. R4 would still be required. The R6 third party review would be limited to a review of the Attachment 1 analysis.

ITC believes there could be issues with identifying all of the proximity stations soon enough to identify their configurations and clearing times soon enough to perform all of the required studies. This is more of an issue as entities add facilities in additional states. The number of coordination agreements could also cause an issue in obtaining all of the required documentation.

Nextera supports EEI comments below: EEI is concerned that the implementation plan requires the initial risk assessment required by CIP-014-4 to be completed on or before the effective date of the Standard and does not provide a phased in approach. The modifications required by the proposed CIP-014-4 include new processes to be established prior to initiating new risk assessments. The proposed 24-month timeline is not reasonable for completing	

the initial risk assessment. EEI suggests allowing the initiation of CIP-014-4 risk assessments to occur on or before the effective date of the standard to allow additional time to modify programs.

Due to the varying risk assessment schedules of entities, the 24 month implementation plan could burden entities who have completed a risk assessment shortly before the effective date of CIP-014-4 and have limited resources to complete another one in a short amount of time. Proposed language: 36 months from the entity's last risk assessment completed or 36 months after the effective date of the standard, which ever is later. This will provide adequate time for entities to adjust to the additional criteria for the risk assessment methodology.

The requirements for an unaffiliated third-party verification of the TO's risk assessment should be removed entirely. This requirement has increased the cost, time and resources required for each TO to perform the risk assessment. We have found that the third-party verification is not used by the RE for any compliance enforcement actions. If the third-party verification provides no value to this process, it should not be included in the CIP-014 requirements. If the 36-month RA requirement is approved, this issue will only become more burdensome.

It potentially could be excessively burdensome on a Transmission Owner (TO) to be required to perform a new risk assessment study within 24 months of the effective implementation date of the revised CIP-014-4 standard. Additionally, limited resources may be available to complete a verification within 90 days of the effective date per Requirement R6. For example, given the current CIP-014-3 R1.1 30 calendar month subsequent risk assessment requirement schedule for a TO which has substations identified under R1, the TO may currently be required to complete a subsequent R1 study as of September 30, 2025. If the revised standard has an effective implementation date of October 1, 2025, the TO would be required to complete a new R1 study within 24 months of October 1, 2025. A more effective and efficient methodology is a phased approach based on the TO's completion date of the TO's most recent R1.1 subsequent risk assessment study. Proposed Language: Each TO shall conduct its first assessment under CIP-014-4 within 36 calendar months after the effective date or within 36 calendar months after their last assessment under CIP-014-3, whichever occurs later.

Thank you for your comment. The initial performance of periodic Requirements is clarified in the Implementation Plan. Based on the industry comments a majority of entities expressed that they need more than 12 months to be ready to comply with CIP-014-4 after applicable government authority approval.

Comment	
The implementation plan accelerates the compliance timeframe specified in the standard. The proposed implementation plan is 24 months. This means some Transmission Owners may have insufficient time, less than 36 months, to complete their next assessment based on the new standard. The implementation plan should be adjusted to 36 months.

MPC holds the position that requiring completion of a CIP-014-4 risk assessment prior to the effective date of the Standard presents duplicative efforts coupled with limited study resources. MPC suggests that entities with a completed risk assessment per CIP-014-3 be required to follow the new assessment frequency once the Standard becomes effective in accordance with R5.

There should be some period of time after the standard becomes effective before the initial risk assessment should be completed. The recommendation is within 24 months following the effective date of this standard.

BPA repeats it recommendation to use terminology like that found in other standards such as FAC-014-3 R6: “Requirement R6 shall be implemented by the Planning Coordinator or Transmission Planner following the effective date of FAC-014-3 when it begins its next cycle for conducting the studies to support its Planning Assessment." BPA believes the inclusion of this language would alleviate concerns about having to comply with a requirement prior to its mandatory enforcement date and help to reduce overall costs for the implementation of the changes.

EEI agrees with the Implementation Plan for CIP-014-4, however, we note that there are additional revisions to CIP-014 that are part of Project 2021-03 to address IROLs. It would be beneficial to align the timelines in the implementation plans for these projects if possible.

Matt Carden - Southern Company - Southern Company Services, Inc. - 1	
Answer	No

Document Name	
Comment	
Southern Company recognizes the financial impacts of performing the risk assessment every 36 months rather than 60 months for Transmission Owners that have not identified any Transmission stations or Transmission substations. This is magnified by the requirement to have an unaffiliated third party verify the risk assessment at a higher frequency.

Lucinda Bradshaw - Lucinda Bradshaw On Behalf of: Byron Booker, Oncor Electric Delivery, 1; - Lucinda Bradshaw	
Answer	No
Document Name	
Comment	
The comments above demonstrate that additional clarity is needed on certain portions of this revised CIP-014-4. Without that additional clarity, Oncor cannot state that the proposed changes to CIP-014-3 are cost effective. As noted above, some of the proposed revisions create additional work for TOs that could increase the TOs' costs. For example, the revised Requirements R2 and R4 will require Oncor to develop, document, and implement new procedures and processes, as well as to develop and implement additional training concerning the new requirements and the new procedures and processes.

BPA does not believe the standard, as is, is cost effective in addressing the reliability of physical security. The spectrum of sites is too broad. BPA believes there is high potential for sites to be identified on CIP-014-4 list that would have little to no effect on the BES if they were disconnected from the grid. The standard, as is, allows sites with RAS capability to be listed as CIP-014, which mitigates an enormous amount of risk, some might argue all. The number of sites that could potentially be categorized as CIP-14 takes resources away from other sites along critical pathways, and sites that directly link to critical infrastructure. Additionally, day-to-day operations of upstream and downstream sites affect whether singular or multiple pieces of equipment in a site are critical. BPA finds the inclusions of R2.1 and R2.2 are so broad as to compound the issues of cost without a large gain in security or reliability. BPA believes the increase in CIP-014 applicability may require more resources than some smaller Transmission Owners have at their disposal. This increase will not only strain the resources of those smaller Transmission Owners but those of larger size within a BA that may be called upon to assist.

Thank you for the comment. Sub-Requirements R2.1 and 2.2 were removed from the previous draft.	
Tamarra Hardie - Public Utility District No. 1 of Chelan County - 6, Group Name CHPD	
Answer	Yes
Document Name	
Comment	
Please see comments provided for R2. More technical guidance from NERC on damage distances for a variety of bomb treat types is desired and modifying the distance requirement in R2 to be based upon technically-supported damage distances rather than personnel evacuation mandates is recommended. Additionally in R2, allowing utilities the flexibility to provide rationale in their CIP-014 assessments	

for why any identified proximate stations within the provided distance should be excluded or if any different distances are used would lead to more realistic physical security scenarios being assessed and reduce the cost-burden of assessing scenarios that are beyond reasonable damage distances.

Currently, CIP-014 requires Transmission Owners to conduct planning analyses, and then have these analyses reviewed by a third party verifier. Requirement 6.1 states the the third party verifier must be a registered Planning Coordinator, Transmission Planner, Reliability Coordinator, or have transmission planning or analysis experience. The TO is not the appropriate registered entity to conduct planning analyses. Our understanding is that this is the reason why the standard requires a third party verification by a PC, TP, or RC. Apparently, NERC agrees that the analysis is best suited for the PC, TP or RC function. Furthermore, the fact that the standard is being revised to assure an adequate and consistent approach in evaluating instability as well as the identification of infrastructure critical to the operation of the BPS, supports the premise that the TO-performed study followed by verification by an unaffiliated third party is not a sufficient method. The better method would be to have an affiliated TP or PC to conduct the analysis. It is not cost effective to require the TO to conduct a planning study and then pay an unaffiliated third party to review the study. This is especially true if the TO is also a registered TP or PC. The TP and PC are the best qualified to conduct such studies. Furthermore, since CIP-014 is being revised to be more prescriptive regarding what should be included in the study methodology, the need for third party verification is significantly decreased. GTC recommends that requirement to perform such an analysis be assigned to the TP or PC functions within the TPL group of standards.

Answer	Yes
Document Name	
Comment	
Rather than requiring Transmission Owners without identified applicable Transmission stations/substations to perform a risk assessment every 36 months, it would be much more cost effective to allow utilities without critical (sub)stations to continue to perform the risk assessment every 60 months. The concern that a 60 month assessment may not include all planned facilities before the subsequent risk assessment is performed 60 months later could be allayed by changing the requirement to include facilities planned to be in service within the next 60 months rather than the next 24 months as required in CIP-014-3.	
Likes 0	
Dislikes 0	
Response	
Thank you for your comments. One of the work scopes from the SAR is to correct any discrepancies between the study period, frequency of study, and the base case(s) a Transmission Owner uses. The drafting team believes that 36 calendar months is a long time, even for utilities who never had critical (sub)stations.	
Jodi Yeary - AEP - 3	
Answer	Yes
Document Name	
Comment	

Yes. While this SAR focused on modification to R1, the standard could meet the intent of the original FERC order in a more cost effective manner by modifying subsequent requirements to allow for Transmission system reinforcement that would reduce the impact of damage to a Transmission station on the Interconnection as an alternative solution to physical security protections.

All of the extreme critical fault scenarios are already being evaluated under the TPL-001 standard which has clear definitions of how, where, what and why. This CIP-014 standard requires undocumented and undefined requirements be included in the risk assessment, which does not satisfy the original intent of the Physical Security Standard. If we want to increase physical security at BES substations, a clear bright line criteria should be established based on kV level and number of interconnections like other CIP standards. Inclusion of vague risk assessment criteria wastes valuable resources which could better be spent focusing on the transmission planning system performance and development of a more robust grid which is not susceptible to the loss of any single applicable substation.

Joseph Scott - Lower Colorado River Authority - 5

Answer	Yes
Document Name	

Comment

An alternative could be requiring a certain level of security be applied consistently across BES substations (i.e., not limited to CIP-014 substations).

These basic requirements could include: 1) security-grade perimeter fencing 2) remote surveillance via motion-sensing video cameras, and 3) local measures such as motion sensor-activated lighting and break-in audible alarms.

When applied at new substations or as these are improved over time, the incremental cost is not significant and supports a hardened system at a broader level.

The alternatives and cost-effective options are outlined in the attached. Overall Strategy for the Standard that meets objectives:	

Identification steps:

- List 1 – stations that meet Attachment 1 criteria, R1
- List 2 – filtering of List 1 with Electrical performance testing, new R2
- List 3 – filtering of List 2 with a nearby (proximate?) potential physical threat assessment, new R3

Results:

- A refined list of stations
- Deploy enhanced physical security at these stations
- Develop policies such as setbacks to reduce future potential physical threats.

Benefits:

- Cost-effective way to better address the intents of a physical security standard as it relates to performance of the bulk electricity system.
- Promote more consistent methodologies among various transmission owners
- Involves the RC to aid in the intersection (overlap) of system criticality and identification of physical threats as the RC has a system-wide view whereas some Transmission Owners may not.

As stated in our response to Questions 3 & 5: To reduce the burden on smaller TOs of developing an R3 methodology and performing the R5 planning studies, consider providing an option for entities to use the list of transmission stations or substations obtained from the Attachment 1 analysis, as the input to R7 for primary control center determination, and as the input to R8 to begin the physical attack evaluation. Attachment 1 would therefore be an option as the R3 methodology that would then be applied in R5. R4 would still be required. The R6 third party review would be limited to a review of the Attachment 1 analysis.

System-wide performance evaluation is the accountability of the Reliability Coordinators. Therefore, if the standard must have system-wide (Interconnection) performance testing and judgement of results, the RC must be involved. Not every facility owner will be able to do this. The standard should be practical to implement. See attached for comments.

Monika Montez - California ISO - 2 - WECC, Group Name ISO/RTO Council Standards Review Committee (SRC)	
Answer	
Document Name	
Comment	
The ISO/RTO Council (IRC) Standards Review Committee (SRC) notes that Criterion 3 in Attachment 1 references Facilities identified by the Planning Coordinator as critical to the derivation of an Interconnection Reliability Operating Limit (IROL). However, under FAC-014-3,	

Planning Coordinators no longer develop IROLs. The SRC recommends that criterion 3 be updated accordingly to remove the reference to the Planning Coordinator.

The SRC also recommends that the drafting team revise the Technical Rationale to indicate whether the unaffiliated third-party validation under Requirement R6 requires the third party to validate the risk assessments completed in accordance with both Requirements R1 and R2 or just Requirement R1. The current Technical Rationale only indicates that validation of Requirement R1 risk assessments is required. The Technical Rationale should also be updated to more clearly correct and clarify all references to requirements to align with the newly proposed CIP-014-4 Requirements R1-R5.

Alternatively, a new SAR could be developed to remove Requirement R6 from the proposed CIP-014-4 standard. The new requirements proposed in CIP-014-4 Requirements R1-R5 outline necessary specifics for more meaningful risk assessments, which reduces the need for unaffiliated third-party verification, especially given that auditors are also directed to apply various methods to test the validity of station identifications under current CIP-014-3 Requirement R1.[1]

[1] CMEP Practice Guide CIP-014-2

Likes 0	
Dislikes 0	

Response

Thank you for your comments. IROLs will be addressed accordingly by other projects if this is effected by other projects.

Third-party verification should include both Requirements R1 and R2 assessment results.

The drafting team has no comments for suggested new SAR to remove Requirement R6.

Understanding that R6, formerly R2 under CIP-014-3, is out of scope for this SAR, WAPA recommends a SAR be drafted to remove R6 as an administrative burden that should no longer be needed, given that this project has added the necessary specifics required for a meaningful risk assessment, diminishing the need for third-party verification. Also, there has been anecdotal experience as an industry that auditors have audited the (CIP-014-3) R1 risk assessments directly without relying on the R2 third-party verification as directed by the RSAW. If (CIP-014-4) R6 is to be retained, 90 calendar days for completing R6 in R6.2 is proving to be tight for some larger entities, which request extension to 180 calendar days (which would be much easier to calculate as six calendar months to avoid getting tripped up on 28/30/31-day months).

• NYPA still believes that Requirement R2 remains vague and open to varied interpretations. For example, under R2 when evaluating the proximate transmission substations, the language in R2 is unclear whether any BES transmission station regardless of its voltage level should be assessed if it falls within 1,500 feet of a station identified in R1. We recommend SDT should give guidance in the standard itself if possible. The proximity of 1500ft tends to have more impact in urban cities therefore we recommend the SDT to consider this situation as well. • Also regarding R3.1, it would be helpful if the SDT could provide guidance on the 'minimum' threshold for identifying unacceptable generation or load loss to support more consistent interpretation and understanding. • Many interconnections projects, at least in the NPCC region, put a placeholder of in-service date of within 3 years, but these dates are often extended based on project specific timelines. Requiring a 36 month risk assessment (R1) would force TOs to study those projects which may not materialize within the said timeline or likely to have their ISDs extended, placing an unnecessary burden on TO’s planning and study resources.

Comment	
• Under R2 clarify if “proximate” substation voltages must be 200kV and above or if the scope included all BES voltages. • Technical Rationale for R3 part 3.4 states: *“the term “inoperable” includes the total loss of communication and protection equipment at the substation, necessitating delayed clearance from far-end relaying to isolate the event’s impacts.”* Clarify if this total loss of equipment is for only the applicable substation or also includes the proximate substation equipment. • The Technical Rationale should clarify that fault type and fault location in a substation will be defined in the TO methodology. • Per the 7/8/25 WebEx Q&A “the standard is silent” on what voltages to simulate faults on in a single substation with multiple voltages (ex 345kV with 230kV or 115kV). The Technical Rationale should clarify that this can be defined in the TO methodology. • The Technical Rationale should clarify if the intent of the standard is for simultaneous faults to be simulated at applicable and proximate substations per the statements made on the 7/8/25 WebEx Q&A.

Matt Carden - Southern Company - Southern Company Services, Inc. - 1	
Answer	
Document Name	
Comment	
Under “Purpose” we prefer the previous language of “as a result of”. Southern Company recommends swapping Requirement R3 and R4 chronologically. This follows a more logical approach of identifying the stations and responsibilities to perform the assessment in the first three requirements followed by an assessment methodology in R4 and the performance of an assessment in R5. Southern Company recommends removing Requirement R6. With the understanding that this is not explicitly in scope of the current SAR, the added specificity of the proposed standard eliminates the reliability benefit of the third-party verifier. Additionally, based on a previous audit of CIP-014-3, Southern Company did not observe the Regional Entity take into consideration the review by the R2 third party verifier. If this is consistent across other Regional Entities, then an elimination of CIP-014-4 R6 may be appropriate due to the extra cost and the lack of a reliability benefit.

Thank you for your comments. Either “due to” and “as result of” serves the same purpose. The drafting team believes that they are both clear enough. The drafting team reviewed the orders for all of the Requirements and believes that this is the right order. Requirement R6 was approved by the industry in the approved version of this Standard. It is out of scope for this project to remove R6.

AEP is supportive of the VSLs, except for R2. Currently, R2 only specifies a Severe VSL with specific reference to “fence line” in the VSL table. This increases the likelihood of severe violations being identified based on disagreements on the method of distance calculation, which is not a high risk reliability objective. Lower severity VSLs should be identified for R2. Thank you for being so responsive to comments from the previous version to this version!

Similar to TPL-001-5.1 Requirement 2.6, we recommend that the SDT consider, and if applicable, outline under which specific circumstances past studies/results can be utilized for the CIP-014-4 risk assessment. The possible use of past studies may reduce workload of entities and support a more cost effective option to address CIP-014-4 needs.

Manitoba Hydro agrees with the modifications made for R5, especially the addition of the new sub-requirement R5.2. However, it will be hard for a third-party reviewer to verify a current assessment unless the results of the previous assessment are provided with the current assessment Manitoba Hydro recommends that requirement R6 be removed from the standard as it is overly administrative. The revisions made from this project specifically outline study requirements and an additional third party review of the study is no longer necessary. In addition, if there were minimal changes to the network from the previous third-party assessment, a new third party assessment provides very little value. The NERC Quality Review (QR) team may be able to assist with this change to make the standard more efficient and cost effective.

AZPS appreciates the clarifications included by the Drafting Team in this draft, however continues to seek additional clarifications regarding entity responsibilities or exclusion of responsibilities for non-owned/operated stations/substations within proximity of identified locations. AZPS seeks clarification on if a site is included as part of Requirement R2 and identified during the risk assessment per R5 but is owned by a different company how that applies to R8-R10.

Consider the addition of definitive or explicit trigger for Requirement R8 if the identification of the critical asset remains unchanged. Without this it creates a significant blind spot because the threat environment can evolve and shift dramatically over the 36-month cycle or even since the initial assessment or implementation of the required physical security controls. Without a built-in mechanism to re-evaluate threats entities may overlook new or emerging vulnerabilities, leaving critical assets exposed.

The primary issue with this standard as it is written, and as this draft continues is the application of requirements/expectations appropriate for the Transmission Planner/Planning Coordinator function to the Transmission Owner instead. This reduces clarity on the types of studies to be performed to assess the extreme events identified in this standard. Regarding R6: With an attempt at clarifying study criteria, though they should be applied to the appropriate planning entity, there is no reason to maintain a requirement for an unaffiliated third party to perform a verification of a transmission planning analysis associated with the risk	

assessment. Instead of requiring planning entities be the third party verifier, they should just perform the study under clearly defined requirements in a TPL standard and communicate this information to the Transmission Owner. It is also important to note the third party verifying the risk assessment for this physical security standard is not required to have expertise in that area according to this requirement. Additionally, the SDT should consider removing the Reliability Coordinator as a potential third party verifier as that function does not perform the type of analysis being sought in this standard. Additional Comment: The analysis outlined in the CIP-014 standard is an evaluation of an extreme event and is based on transmission planning analysis. Currently, the existing TPL-001 standard requires the evaluation of extreme events, though, it is not specific to this particular substation outage analysis and corrective actions are not required for these events. Additionally, there are ongoing efforts to establish a separate standard to address the long-term planning analysis around extreme weather events. It would seem NERC and the industry are potentially missing an opportunity to consolidate requirements around the evaluation of extreme events better than what is currently provided for in the current construct of the existing and planned Reliability Standards. Consideration should be given by NERC to provide a better pathway to house long-term planning requirements around extreme event analysis within the TPL standards (not CIP) and specify the reliability analyses needed, the parameters for determining reliability, expectations for corrective actions, and the communication path from planning to owners and others with a reliability-related need for this information. The planning assessment/CAP required by TPL-001 is already required to be distributed to applicable owners. Clarifying the extreme event expectations in TPL-001 to specify the substation outage alluded to in CIP-014 is one pathway to better align standard requirements with the appropriate entity.

Understanding that R6, formerly R2 under CIP-014-3, is out of scope for this SAR, MRO NSRF recommends a SAR be drafted to remove R6 as an administrative burden that should no longer be needed, given that this project has added the necessary specifics required for a meaningful risk assessment, diminishing the need for third-party verification. Also, there has been anecdotal experience as an industry that auditors have audited the (CIP-014-3) R1 risk assessments directly without relying on the R2 third-party verification as directed by the RSAW. If (CIP-014-4) R6 is to be retained, 90 calendar days for completing R6 in R6.2 is proving to be tight for some larger entities, which request extension to 180 calendar days (which would be much easier to calculate as six calendar months to avoid getting tripped up on 28/30/31-day months).

BPA appreciates the opportunity to comment. BPA recognizes CIP-014 and physical security are growing beyond the intent of the original standard. BPA recommends evaluating the need to add additional NERC registrations to the standard applicability to broaden the available information required within CIP-014-4. BPA has noticed a possible grammar error with the redline of the technical rationale. Under the Rationale for Requirement R3, Part 3.1, located in the second line of the second paragraph Transmission substation is repeated twice. BPA believes this was supposed to follow the NERC glossary of terms and read “Transmission stations or sub-stations.

Response	
Thank you for your comments. The reason for CIP-014 and physical security are growing beyond the intent of the original standard is because there is a gap in reliability based on the SAR pointed out. The drafting team believes that current draft meets the SAR workscopes. “Transmission substation” in the Technical Rationale has been fixed.

Standard Development Timeline

This section is maintained by the drafting team during the development of the standard and will be removed when the standard is adopted by the NERC Board of Trustees (Board).

Description of Current Draft

CIP-014-4 is posted for a 45-day formal comment period with additional ballot.

Completed Actions	Date
Standards Committee approved Standard Authorization Request for posting	June 21, 2023
Standard Authorization Request posted for comment	July 26 – August 24, 2023
Accepted Revised Standard Authorization Request	January 17, 2024
45-day formal or informal comment period with ballot	May 20 – July 3, 2024
45-day formal or informal comment period with additional ballot	September 23 – November 6, 2024
45-day formal comment period with additional ballot	June 6 – July 21, 2025

Anticipated Actions	Date
45-day formal comment period with additional ballot	March 31 – May 14, 2026
10-day final ballot	May 27 – June 5, 2026
Board adoption	October 8, 2026

New or Modified Term(s) Used in NERC Reliability Standards

This section includes all new or modified terms used in the proposed standard that will be included in the *Glossary of Terms Used in NERC Reliability Standards* upon applicable regulatory approval. Terms used in the proposed standard that are already defined and are not being modified can be found in the *Glossary of Terms Used in NERC Reliability Standards*. The new or revised terms listed below will be presented for approval along with the proposed standard. Upon Board adoption, this section will be removed.

Term(s):

None.

A. Introduction

1. **Title:** Physical Security

2. **Number:** CIP-014-4

3. **Purpose:** To identify and protect Transmission stations and Transmission substations, and their associated primary control centers, that if rendered inoperable or damaged due to a physical attack, could result in instability, uncontrolled separation, or Cascading within an Interconnection.

4. **Applicability:**

   4.1. Functional Entities:

   4.1.1. Transmission Owner that owns or jointly owns one or more Transmission stations or Transmission substations that meet the applicability criteria of Attachment 1.

   4.1.2. Transmission Operator

   Exemption: Facilities in a "protected area," as defined in 10 C.F.R. § 73.2, within the scope of a security plan approved or accepted by the Nuclear Regulatory Commission are not subject to this Standard; or Facilities within the scope of a security plan approved or accepted by the Canadian Nuclear Safety Commission are not subject to this Reliability Standard.

5. **Effective Date:** See Implementation Plan for CIP-014-4.

B. Requirements and Measures

R1. Each Transmission Owner shall, at least once every 36 calendar months, identify each applicable Transmission station and Transmission substation meeting any of the criteria in Attachment 1 that is either existing or planned to be in service within 36 calendar months. *[Violation Risk Factor: High; Time-Horizon: Long-term Planning]*

M1. Examples of evidence may include, but are not limited to, dated written or electronic documentation of the Transmission station(s) and Transmission substation(s) (existing and those planned to be in service within 36 calendar months) that meet any of the criteria in Attachment 1.

R2. Each Transmission Owner with applicable Transmission station(s) or Transmission substation(s) identified in Requirement R1 shall identify proximate existing Bulk Electric System Transmission station(s) and Bulk Electric System Transmission substation(s), irrespective of ownership, within 1500 feet or 457 meters (the shortest distance, measured substation fence line to substation fence line) of an applicable Transmission station or Transmission substation identified in Requirement R1. *[Violation Risk Factor: Medium; Time-Horizon: Long-term Planning]*

M2. Examples of evidence may include, but are not limited to, dated written or electronic documentation of the Bulk Electric System Transmission stations or Bulk Electric System Transmission substations identified in Requirement R2.

R3. Each Transmission Owner shall have a documented risk assessment methodology for evaluating the loss of each applicable Transmission station or Transmission substation identified in Requirement R1. The methodology shall include, at a minimum, the following: *[Violation Risk Factor: High; Time-Horizon: Long-term Planning]*

3.1. Documented criteria for assessing instability, uncontrolled separation, or Cascading within an Interconnection. The criteria shall include, at a minimum, technically justified thresholds identifying unacceptable generation and load loss within an Interconnection.

3.2. A provision that steady-state and dynamic simulations shall each be performed using at a minimum one System peak Load case and one System Off-Peak Load case.

3.3. Specifications for simulations at each applicable Transmission station or Transmission substation identified in accordance with Requirement R1 and, if applicable, at each associated proximate existing Bulk Electric System Transmission station(s) and Bulk Electric System Transmission substation(s) identified in accordance with Requirement R2, that include:

3.3.1. At the applicable Transmission station or Transmission substation:

3.3.1.1. Prior loss of communication and Protection Systems;

3.3.1.2. Application of a Fault or Faults; and

3.3.1.3. Delayed (remote) clearing times shall be used unless otherwise technically substantiated.

3.3.2. At each proximate existing Bulk Electric System Transmission station(s) and Bulk Electric System Transmission substation(s), as applicable:

3.3.2.1. Application of a Fault or Faults, either simultaneous with or following the Fault or Faults applied under Part 3.3.1.2; and

3.3.2.2. Normal clearing times shall be used unless otherwise technically substantiated.

3.3.3. A documented justification for the Fault(s) associated with physical attack to be simulated. A single justification may be used for multiple locations. The justification shall include at a minimum:

3.3.3.1. The type of credible high-severity physical attack considered; and

3.3.3.2. The type of Fault(s) selected based upon the attack considered.

3.3.4. Removal of all Elements that Protection Systems and other controls are expected to automatically disconnect.

3.3.5. Actual or more conservative clearing times shall be used.

M3. Each Transmission Owner shall provide dated evidence, such as electronic or hard copies, of a risk assessment methodology satisfying Requirement R3.

R4. Each Transmission Owner with applicable Transmission station(s) and Transmission substation(s) identified in Requirement R1 jointly owned by multiple Transmission Owners shall coordinate with each appropriate Transmission Owner(s) to determine and document their individual and joint responsibilities under Requirement R3 and Requirement R5. *[Violation Risk Factor: Medium; Time-Horizon: Operations Planning, Long-term Planning]*

M4. Examples of acceptable evidence may include, but are not limited to, dated documentation, such as meeting minutes, agreements, and email correspondence, that identifies that agreement has been reached on individual and joint responsibilities for performing the required risk assessments.

R5. At least once every 36 calendar months, each Transmission Owner shall perform a risk assessment to identify applicable Transmission station(s) and Transmission substation(s) identified in Requirement R1, that if rendered inoperable or damaged could result in instability, uncontrolled separation, or Cascading within an Interconnection, using the methodology established in Requirement R3. Jointly owned Transmission station(s) and Transmission substation(s) shall be assessed according to the responsibilities documented under Requirement R4. If proximate Bulk Electric System Transmission station(s) and Bulk Electric System Transmission substation(s) were identified in Requirement R2, they shall be included in the risk

assessment according to Requirement R3, Part 3.3. *[Violation Risk Factor: High; Time-Horizon: Operations Planning, Long-term Planning]*

5.1. If during a risk assessment, a Transmission station or Transmission substation is identified in either the dynamic or steady-state simulation as causing instability, uncontrolled separation, or Cascading within an Interconnection when rendered inoperable or damaged, then no further simulation is required.

5.2. If a previous risk assessment has identified a Transmission station or Transmission substation as causing instability, uncontrolled separation, or Cascading within an Interconnection when rendered inoperable or damaged, then the Transmission Owner may forgo additional assessments on that Transmission station or Transmission substation. Requirement R5, Part 5.3 and Requirement R7 through Requirement R10 still apply to that Transmission station or Transmission substation until a new risk assessment demonstrates otherwise.

5.3. The Transmission Owner shall identify the primary control center that operationally controls each Transmission station or Transmission substation identified as causing instability, uncontrolled separation, or Cascading within an Interconnection when rendered inoperable or damaged in the Requirement R5 risk assessment.

M5. Examples of acceptable evidence may include, but are not limited to, dated written or electronic documentation of the risk assessment satisfying Requirement R5 including the identified Transmission station(s) or Transmission substation(s). For Requirement R5, Part 5.3, examples of acceptable evidence may include, but are not limited to, dated written or electronic documentation of the identification of the primary control center that operationally controls each identified Transmission station or Transmission substation.

R6. Each Transmission Owner shall have an unaffiliated third party verify the risk assessment performed under Requirement R5. The verification may occur concurrently with or after the risk assessment performed under Requirement R5. *[Violation Risk Factor: Medium; Time-Horizon: Long-term Planning]*

6.1. Each Transmission Owner shall select an unaffiliated verifying entity that is either:

- A registered Planning Coordinator, Transmission Planner, or Reliability Coordinator; or
- An entity that has transmission planning or analysis experience.

6.2. The unaffiliated third-party verification shall verify the Transmission Owner's risk assessment performed under Requirement R5, which may include recommendations for the addition or deletion of a Transmission station(s) or Transmission substation(s). The Transmission Owner shall ensure the verification

is completed within 90 calendar days following the completion of the Requirement R5 risk assessment.

6.3. If the unaffiliated verifying entity recommends that the Transmission Owner add a Transmission station(s) or Transmission substation(s) to, or remove a Transmission station or Transmission substation from, its identification under Requirement R5, the Transmission Owner shall either, within 60 calendar days of completion of the verification, for each recommended addition or removal of a Transmission station or Transmission substation:

- Modify its identification under Requirement R5 consistent with the recommendation; or
- Document the technical basis for not modifying the identification in accordance with the recommendation.

6.4. Each Transmission Owner shall implement procedures, such as the use of non-disclosure agreements, for protecting sensitive or confidential information made available to the unaffiliated third-party verifier and to protect or exempt sensitive or confidential information developed pursuant to this Reliability Standard from public disclosure.

M6. Examples of acceptable evidence may include, but are not limited to, dated written or electronic documentation that the Transmission Owner completed an unaffiliated third party verification of the Requirement R5 risk assessment and satisfied all of the applicable provisions of Requirement R6, including, if applicable, documenting the technical basis for not modifying the identification in Requirements R1, R2, R3, R4, and R5 as specified under Part 6.3. Additionally, examples of evidence may include, but are not limited to, written or electronic documentation of procedures to protect information under Part 6.4.

R7. For a primary control center(s) identified by the Transmission Owner according to Requirement R5, Part 5.3 that a) operationally controls an identified Transmission station or Transmission substation verified according to Requirement R6, and b) is not under the operational control of the Transmission Owner: the Transmission Owner shall, within seven calendar days following completion of Requirement R6, notify the Transmission Operator that has operational control of the primary control center of such identification and the date of completion of Requirement R6. *[Violation Risk Factor: Lower; Time-Horizon: Long-term Planning]*

7.1. If a Transmission station or Transmission substation previously identified under Requirements R1 and R5 and verified according to Requirement R6 is removed from the identification during a subsequent risk assessment performed according to Requirement R5 or a verification according to Requirement R6, then the Transmission Owner shall, within seven calendar days following the verification or the subsequent risk assessment, notify the Transmission Operator that has operational control of the primary control center of the removal.

M7. Examples of acceptable evidence may include, but are not limited to, written or electronic notifications or communications that the Transmission Owner notified each Transmission Operator, as applicable, according to Requirement R7.

R8. Each Transmission Owner that identified a Transmission station, Transmission substation, or a primary control center in Requirement R5 and verified according to Requirement R6, and each Transmission Operator notified by a Transmission Owner according to Requirement R7, shall conduct an evaluation of the potential threats and vulnerabilities of a physical attack to each of their respective Transmission station(s), Transmission substation(s), and primary control center(s) identified in Requirement R5 and verified according to Requirement R6. The evaluation shall consider the following: *[Violation Risk Factor: Medium; Time-Horizon: Operations Planning, Long-term Planning]*

8.1. Unique characteristics of the identified and verified Transmission station(s), Transmission substation(s), and primary control center(s);

8.2. Prior history of attack(s) on similar facilities taking into account the frequency, geographic proximity, and severity of past physical security related events; and

8.3. Intelligence or threat warnings received from sources such as law enforcement, the Electric Reliability Organization (ERO), the Electricity Sector Information Sharing and Analysis Center (E-ISAC), U.S. federal and/or Canadian governmental agencies, or their successors.

M8. Examples of evidence may include, but are not limited to, dated written or electronic documentation that the Transmission Owner or Transmission Operator conducted an evaluation of the potential threats and vulnerabilities of a physical attack to their respective Transmission station(s), Transmission substation(s), and primary control center(s) as specified in Requirement R8.

R9. Each Transmission Owner that identified a Transmission station, Transmission substation, or primary control center in Requirement R5 and verified according to Requirement R6, and each Transmission Operator notified by a Transmission Owner according to Requirement R7, shall develop and implement a documented physical security plan(s) that covers their respective Transmission station(s), Transmission substation(s), and primary control center(s). The physical security plan(s) shall be developed within 120 calendar days following the completion of Requirement R6 and executed according to the timeline specified in the physical security plan(s). The physical security plan(s) shall include the following attributes: [*Violation Risk Factor*: *High; Time-Horizon: Long-term Planning*]

9.1. Resiliency or security measures designed collectively to deter, detect, delay, assess, communicate, and respond to potential physical threats and vulnerabilities identified during the evaluation conducted in Requirement R8.

9.2. Law enforcement contact and coordination information.

9.3. A timeline for executing the physical security enhancements and modifications specified in the physical security plan.

9.4. Provisions to evaluate evolving physical threats, and their corresponding security measures, to the Transmission station(s), Transmission substation(s), or primary control center(s).

M9. Examples of evidence may include, but are not limited to, dated written or electronic documentation of its physical security plan(s) that covers their respective identified and verified Transmission station(s), Transmission substation(s), and primary control center(s) as specified in Requirement R6, and additional evidence demonstrating execution of the physical security plan according to the timeline specified in the physical security plan.

R10. Each Transmission Owner that identified a Transmission station, Transmission substation, or primary control center in Requirement R5 and verified according to Requirement R6, and each Transmission Operator notified by a Transmission Owner according to Requirement R7, shall have an unaffiliated third party review the evaluation performed under Requirement R8 and the security plan(s) developed under Requirement R9. The review may occur concurrently with or after completion of the evaluation performed under Requirement R8 and the security plan development under Requirement R9. *[Violation Risk Factor: Medium; Time-Horizon: Long-term Planning]*

10.1. Each Transmission Owner and Transmission Operator shall select an unaffiliated third-party reviewer from the following:

- An entity or organization with electric industry physical security experience and whose review staff has at least one member who holds either a Certified Protection Professional (CPP) or Physical Security Professional (PSP) certification;
- An entity or organization approved by the ERO;
- A governmental agency with physical security expertise; or
- An entity or organization with demonstrated law enforcement, government, or military physical security expertise.

10.2. The Transmission Owner or Transmission Operator, respectively, shall ensure that the unaffiliated third-party review is completed within 90 calendar days of completing the security plan(s) developed in Requirement R9. The unaffiliated third-party review may, but is not required to, include recommended changes to the evaluation performed under Requirement R8 or the security plan(s) developed under Requirement R9.

10.3. If the unaffiliated third-party reviewer recommends changes to the evaluation performed under Requirement R8 or security plan(s) developed under

Requirement R9, the Transmission Owner or Transmission Operator shall, within 60 calendar days of the completion of the unaffiliated third party review, for each recommendation:

- Modify its evaluation or security plan(s) consistent with the recommendation; or
- Document the reason(s) for not modifying the evaluation or security plan(s) consistent with the recommendation.

10.4. Each Transmission Owner and Transmission Operator shall implement procedures, such as the use of non-disclosure agreements, for protecting sensitive or confidential information made available to the unaffiliated third-party reviewer and to protect or exempt sensitive or confidential information developed pursuant to this Reliability Standard from public disclosure.

M10. Examples of evidence may include, but are not limited to, written or electronic documentation that the Transmission Owner or Transmission Operator had an unaffiliated third party review the evaluation performed under Requirement R8 and the security plan(s) developed under Requirement R9 as specified in Requirement R10 including, if applicable, documenting the reasons for not modifying the evaluation or security plan(s) in accordance with a recommendation under Part 10.3. Additionally, examples of evidence may include, but are not limited to, written or electronic documentation of procedures to protect information under Part 10.4.

C. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority: "Compliance Enforcement Authority" means NERC or the Regional Entity in their respective roles of monitoring and enforcing compliance with the NERC Reliability Standards.

1.2. Evidence Retention: The following evidence retention period(s) identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the Compliance Enforcement Authority may ask an entity to provide other evidence to show that it was compliant for the full-time period since the last audit.

The Transmission Owner and Transmission Operator shall keep data or evidence to show compliance, as identified below, unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation:

The responsible entities shall retain evidence, as per Requirements R1 through R10, for three years.

If a Responsible Entity is found non-compliant, it shall keep information related to the non-compliance until mitigation is complete and approved, or for the time specified above, whichever is longer.

The CEA shall keep the last audit records and all requested and submitted subsequent audit records.

1.3. Compliance Monitoring and Enforcement Program: "Compliance Monitoring Enforcement Program" or "CMEP" means, depending on the context (1) the NERC Compliance Monitoring and Enforcement Program (Appendix 4C to the NERC Rules of Procedure) or the Commission-approved program of a Regional Entity, as applicable, or (2) the program, department or organization within NERC or a Regional Entity that is responsible for performing compliance monitoring and enforcement activities with respect to Registered Entities' compliance with Reliability Standards.

Violation Severity Levels

	Violation Severity Levels			
	Lower VSL	**Moderate VSL**	**High VSL**	**Severe VSL**
R1.	The Transmission Owner identified each applicable Transmission station(s) and Transmission substation(s) per Attachment 1, but did so after 36 calendar months, but less than or equal to 38 calendar months. OR The Transmission Owner identified each applicable Transmission station(s) and Transmission substation(s), but failed to identify less than or equal to 10% of the applicable Transmission station(s) and Transmission substation(s) per Attachment 1.	The Transmission Owner identified each applicable Transmission station(s) and Transmission substation(s) per Attachment 1, but did so after 38 calendar months, but less than or equal to 40 calendar months. OR The Transmission Owner identified each applicable Transmission station(s) and Transmission substation(s), but failed to identify more than 10% and less than or equal to 20% of the applicable Transmission station(s) and Transmission substation(s) per Attachment 1.	The Transmission Owner identified each applicable Transmission station(s) and Transmission substation(s) per Attachment 1, but did so after 40 calendar months, but less than or equal to 42 calendar months. OR The Transmission Owner identified each applicable Transmission station(s) and Transmission substation(s), but failed to identify more than 20% and less than or equal to 30% of the applicable Transmission station(s) and Transmission substation(s) per Attachment 1.	The Transmission Owner failed to identify each applicable Transmission station(s) and Transmission substation(s) per Attachment 1. OR The Transmission Owner identified each applicable Transmission station(s) and Transmission substation(s) per Attachment 1, but did so after more than 42 calendar months. OR The Transmission Owner identified each applicable Transmission station(s) and Transmission substation(s), but failed to identify more than 30% of the applicable Transmission station(s) and Transmission substation(s) per Attachment 1.

Attachment 1 – Applicability Criteria

Applicable Transmission station(s) or Transmission substation(s) are those that meet any of the following criteria:

1. Transmission Facilities operated at 500 kV or higher. For the purpose of this criterion, the collector bus for a generation plant is not considered a Transmission Facility, but is part of the generation interconnection Facility.

2. Transmission Facilities that are operating between 200 kV and 499 kV at a single station or substation, where the station or substation is connected at 200 kV or higher voltages to three or more other Transmission stations or substations and has an "aggregate weighted value" exceeding 3,000 according to the table below. The "aggregate weighted value" for a single station or substation is determined by summing the "weight value per line" shown in the table below for each incoming and each outgoing Bulk Electric System Transmission Line that is connected to another Transmission station or substation. For the purpose of this criterion, the collector bus for a generation plant is not considered a Transmission Facility, but is part of the generation interconnection Facility.

Voltage Value of a Line	Weight Value per Line
less than 200 kV (not applicable)	(not applicable)
200 kV to 299 kV	700
300 kV to 499 kV	1,300
500 kV and above	N/A

3. Transmission Facilities at a single station or substation location that are identified by their Reliability Coordinator, Planning Coordinator, or Transmission Planner as critical to the derivation of Interconnection Reliability Operating Limits (IROLs) and their associated contingencies.

4. Transmission Facilities identified as essential to meeting Nuclear Plant Interface Requirements (NPIRs).

Standard Development Timeline

This section is maintained by the drafting team during the development of the standard and will be removed when the standard is adopted by the NERC Board of Trustees (Board).

Description of Current Draft

CIP-014-4 is posted for a 45-day formal comment period with additional ballot.

Completed Actions	Date
Standards Committee approved Standard Authorization Request (SAR) for posting	June 21, 2023
SAR posted for comment	July 26, 2023 – August 24, 2023
Accepted Revised SAR	January 17, 2024
45-day formal or informal comment period with ballot	May 20, 2024 – July 3, 2024
45-day formal or informal comment period with additional ballot	September 23, 2024 – November 6, 2024
45-day formal comment period with additional ballot	June 6, 2025 – July 21, 2025

Anticipated Actions	Date
45-day formal comment period with additional ballot	March 31, 2026 – May 14, 2026
10-day final ballot	May 27, 2026 – June 5, 2026
Board adoption	October 8, 2026

New or Modified Term(s) Used in NERC Reliability Standards

This section includes all new or modified terms used in the proposed standard that will be included in the *Glossary of Terms Used in NERC Reliability Standards* upon applicable regulatory approval. Terms used in the proposed standard that are already defined and are not being modified can be found in the *Glossary of Terms Used in NERC Reliability Standards*. The new or revised terms listed below will be presented for approval along with the proposed standard. Upon Board adoption, this section will be removed.

Term(s):

None.

A. Introduction

1. **Title:** Physical Security

2. **Number:** CIP-014-4

3. **Purpose:** To identify and protect Transmission stations and Transmission substations, and their associated primary control centers, that if rendered inoperable or damaged due to a physical attack, could ~~cause~~result in instability, uncontrolled separation, or Cascading within an Interconnection.

4. **Applicability:**

   4.1. Functional Entities:

   4.1.1. Transmission Owner that owns or jointly owns one or more Transmission stations or Transmission substations that meet the applicability criteria of Attachment 1.

   4.1.2. Transmission Operator

   Exemption: Facilities in a "protected area," as defined in 10 C.F.R. § 73.2, within the scope of a security plan approved or accepted by the Nuclear Regulatory Commission ~~(NRC)~~ are not subject to this Standard; or Facilities within the scope of a security plan approved or accepted by the Canadian Nuclear Safety Commission are not subject to this Reliability Standard.

5. **Effective Date:** See Implementation Plan for CIP-014-4.

B. Requirements and Measures

R1. Each Transmission Owner shall, at least once every 36 calendar months, ~~shall~~ identify each applicable Transmission station and Transmission substation meeting any of the criteria in Attachment 1 that is either existing or planned to be in service within 36 calendar months. *[Violation Risk Factor: High; Time-Horizon: Long-term Planning]*

M1. Examples of evidence may include, but are not limited to, dated written or electronic documentation of the Transmission station(s) and Transmission substation(s) (existing and those planned to be in service within 36 calendar months) that meet any of the criteria in Attachment 1.

R2. Each Transmission Owner with applicable Transmission station(s) or Transmission substation(s) identified in Requirement R1 shall identify proximate existing Bulk Electric System Transmission station(s) and Bulk Electric System Transmission substation(s), irrespective of ownership, within 1500 feet or 457 meters (the shortest distance, measured substation fence line to substation fence line) of an applicable Transmission station or Transmission substation identified in Requirement R1. *[Violation Risk Factor: Medium; Time-Horizon: Long-term Planning]*

M2. Examples of evidence may include, but are not limited to, dated written or electronic documentation of the Bulk Electric System Transmission stations or Bulk Electric System Transmission substations ~~determined~~identified in Requirement R2.

R3. Each Transmission Owner shall have a documented risk assessment methodology for evaluating the loss of each applicable Transmission station or Transmission substation identified in Requirement R1. The methodology shall include, at a minimum, the following: *[Violation Risk Factor: High; Time-Horizon: Long-term Planning]*

3.1. Documented criteria for assessing instability, uncontrolled separation, or Cascading within an Interconnection. The criteria shall include, at a minimum, technically justified thresholds identifying unacceptable generation and load loss within an Interconnection.

3.2. A provision that steady-state and dynamic simulations shall each be performed using at a minimum one System peak Load case and ~~a~~one System Off-Peak Load case.

~~**3.3.** A specification for Fault simulations, including:~~

3.3. ~~• For~~Specifications for simulations at each applicable Transmission station or Transmission substation ~~listed~~identified in accordance with Requirement R1 and, ~~a Fault at the~~if applicable ~~Transmission station or Transmission substation.~~

~~•~~, at ~~For~~ each associated proximate existing Bulk Electric System Transmission station ~~or~~(s) and Bulk Electric System Transmission substation ~~determined~~(s) identified in accordance with Requirement R2 ~~as being in proximity to an applicable Transmission~~

~~station or Transmission substation, Faults at both the applicable and proximate Transmission station(s) or Transmission substation(s).~~, that include:

~~**3.4.** A specification that Fault simulations assume the loss of communication and Protection Systems at the applicable Transmission station(s) or Transmission substation(s) prior to or simultaneous with the Fault(s) studied under Requirement R3, Parts 3.3.1 and 3.3.2.~~

3.3.1. At the applicable Transmission station or Transmission substation:

3.3.1.1. Prior loss of communication and Protection Systems;

3.3.1.2. Application of a Fault or Faults; and

3.3.1.3. Delayed (remote) clearing times shall be used unless otherwise technically substantiated.

3.3.2. At each proximate existing Bulk Electric System Transmission station(s) and Bulk Electric System Transmission substation(s), as applicable:

3.3.2.1. Application of a Fault or Faults, either simultaneous with or following the Fault or Faults applied under Part 3.3.1.2; and

3.3.2.2. Normal clearing times shall be used unless otherwise technically substantiated.

3.3.3. A documented justification for the Fault(s) associated with physical attack to be simulated. A single justification may be used for multiple locations. The justification shall include at a minimum:

3.3.3.1. The type of credible high-severity physical attack considered; and

3.3.3.2. The type of Fault(s) selected based upon the attack considered.

~~•~~ **~~3.3.4.~~** Removal of all Elements that Protection Systems and other controls are expected to automatically disconnect~~ for each event~~.

~~• Delayed (remote) clearing times shall be used unless otherwise technically substantiated.~~

~~•~~ **~~3.3.5.~~** Actual or more conservative clearing times shall be used~~ unless otherwise technically substantiated~~.

M3. Each Transmission Owner shall provide dated evidence, such as electronic or hard copies, of a risk assessment methodology satisfying Requirement R3.

R4. Each Transmission Owner with applicable Transmission station(s) and Transmission substation(s) identified in Requirement R1 ~~containing Bulk Electric System (BES) Elements~~jointly owned by multiple Transmission Owners shall coordinate with each appropriate Transmission Owner(s) to determine and document their individual and

joint responsibilities ~~for documenting a risk assessment methodology~~ under Requirement R3 and ~~for performing any required risk assessments per~~ Requirement R5. *[Violation Risk Factor: Medium; Time-Horizon: Operations Planning, Long-term Planning]*

M4. Examples of acceptable evidence may include, but are not limited to, dated documentation, such as meeting minutes, agreements, and email correspondence, that identifies that agreement has been reached on individual and joint responsibilities for performing the required risk assessments.

R5. At least once every 36 calendar months, each Transmission Owner shall perform a risk assessment to identify applicable Transmission station(s) and Transmission substation(s) identified in Requirement R1, that if rendered inoperable or damaged could result in instability, uncontrolled separation, or Cascading within an Interconnection, using the methodology established in Requirement R3~~, including any~~. Jointly owned Transmission station(s) and Transmission substation(s) ~~identified in accordance with~~shall be assessed according to the responsibilities documented under Requirement R4. If proximate Bulk Electric System Transmission station(s) and Bulk Electric System Transmission substation(s) were identified in Requirement R2, they ~~should also~~shall be included in the risk assessment according to Requirement R3, Part 3.3. *[Violation Risk Factor: High; Time-Horizon: Operations Planning, Long-term Planning]*

5.1. ~~During the current~~If during a risk assessment, a Transmission station or Transmission substation is identified in either the dynamic or steady-state simulation as causing instability, uncontrolled separation, or Cascading within an Interconnection when rendered inoperable or damaged ~~requires~~, then no further simulation is required.

5.2. If a previous risk assessment has identified a Transmission station or Transmission substation as causing instability, uncontrolled separation, or Cascading within an Interconnection when rendered inoperable or damaged, then the Transmission Owner may forgo additional assessments on that Transmission station or Transmission substation. Requirement R5, Part 5.3 and Requirement R7 through Requirement R10 still apply to that Transmission station or Transmission substation until a new risk assessment demonstrates otherwise.

5.3. The Transmission Owner shall identify the primary control center that operationally controls each Transmission station or Transmission substation identified as causing instability, uncontrolled separation, or Cascading within an Interconnection when rendered inoperable or damaged in the Requirement R5 risk assessment.

M5. Examples of acceptable evidence may include, but are not limited to, dated written or electronic documentation of the risk assessment satisfying Requirement R5 including

the identified Transmission station(s) or Transmission substation(s). For Requirement R5, Part 5.3, examples of acceptable evidence may include, but are not limited to, dated written or electronic documentation of the identification of the primary control center that operationally controls each identified Transmission station or Transmission substation.

R6. Each Transmission Owner shall have an unaffiliated third party verify the risk assessment performed under Requirement R5. The verification may occur concurrently with or after the risk assessment performed under Requirement R5. *[Violation Risk Factor: Medium; Time-Horizon: Long-term Planning]*

6.1. Each Transmission Owner shall select an unaffiliated verifying entity that is either:

- A registered Planning Coordinator, Transmission Planner, or Reliability Coordinator; or
- An entity that has transmission planning or analysis experience.

6.2. The unaffiliated third-party verification shall verify the Transmission Owner's risk assessment performed under Requirement R5, which may include recommendations for the addition or deletion of a Transmission station(s) or Transmission substation(s). The Transmission Owner shall ensure the verification is completed within 90 calendar days following the completion of the Requirement R5 risk assessment.

6.3. If the unaffiliated verifying entity recommends that the Transmission Owner add a Transmission station(s) or Transmission substation(s) to, or remove a Transmission station or Transmission substation from, its identification under Requirement R5, the Transmission Owner shall either, within 60 calendar days of completion of the verification, for each recommended addition or removal of a Transmission station or Transmission substation:

- Modify its identification under Requirement R5 consistent with the recommendation; or
- Document the technical basis for not modifying the identification in accordance with the recommendation.

6.4. Each Transmission Owner shall implement procedures, such as the use of non-disclosure agreements, for protecting sensitive or confidential information made available to the unaffiliated third-party verifier and to protect or exempt sensitive or confidential information developed pursuant to this Reliability Standard from public disclosure.

M6. Examples of acceptable evidence may include, but are not limited to, dated written or electronic documentation that the Transmission Owner completed an unaffiliated third party verification of the Requirement R5 risk assessment and satisfied all of the applicable provisions of Requirement R6, including, if applicable, documenting the technical basis for not modifying the identification in Requirements R1, R2, R3, R4, and

R5 as specified under Part 6.3. Additionally, examples of evidence may include, but are not limited to, written or electronic documentation of procedures to protect information under Part 6.4.

R7. For a primary control center(s) identified by the Transmission Owner according to Requirement R5, Part ~~5.2~~5.3 that a) operationally controls an identified Transmission station or Transmission substation verified according to Requirement R6, and b) is not under the operational control of the Transmission Owner: the Transmission Owner shall, within seven calendar days following completion of Requirement R6, notify the Transmission Operator that has operational control of the primary control center of such identification and the date of completion of Requirement R6. *[Violation Risk Factor: Lower; Time-Horizon: Long-term Planning]*

7.1. If a Transmission station or Transmission substation previously identified under Requirements R1~~, R2, R3, R4,~~ and R5 and verified according to Requirement R6 is removed from the identification during a subsequent risk assessment performed according to Requirement R5 or a verification according to Requirement R6, then the Transmission Owner shall, within seven calendar days following the verification or the subsequent risk assessment, notify the Transmission Operator that has operational control of the primary control center of the removal.

M7. Examples of acceptable evidence may include, but are not limited to, written or electronic notifications or communications that the Transmission Owner notified each Transmission Operator, as applicable, according to Requirement R7.

R8. Each Transmission Owner that identified a Transmission station, Transmission substation, or a primary control center in Requirement R5 and verified according to Requirement R6, and each Transmission Operator notified by a Transmission Owner according to Requirement R7, shall conduct an evaluation of the potential threats and vulnerabilities of a physical attack to each of their respective Transmission station(s), Transmission substation(s), and primary control center(s) identified in Requirement R5 and verified according to Requirement R6. The evaluation shall consider the following: *[Violation Risk Factor: Medium; Time-Horizon: Operations Planning, Long-term Planning]*

8.1. Unique characteristics of the identified and verified Transmission station(s), Transmission substation(s), and primary control center(s);

8.2. Prior history of attack(s) on similar facilities taking into account the frequency, geographic proximity, and severity of past physical security related events; and

8.3. Intelligence or threat warnings received from sources such as law enforcement, the Electric Reliability Organization (ERO), the Electricity Sector Information Sharing and Analysis Center (E-ISAC), U.S. federal and/or Canadian governmental agencies, or their successors.

M8. Examples of evidence may include, but are not limited to, dated written or electronic documentation that the Transmission Owner or Transmission Operator conducted an evaluation of the potential threats and vulnerabilities of a physical attack to their respective Transmission station(s), Transmission substation(s), and primary control center(s) as specified in Requirement R8.

R9. Each Transmission Owner that identified a Transmission station, Transmission substation, or primary control center in Requirement R5 and verified according to Requirement R6, and each Transmission Operator notified by a Transmission Owner according to Requirement R7, shall develop and implement a documented physical security plan(s) that covers their respective Transmission station(s), Transmission substation(s), and primary control center(s). The physical security plan(s) shall be developed within 120 calendar days following the completion of Requirement R6 and executed according to the timeline specified in the physical security plan(s). The physical security plan(s) shall include the following attributes: [*Violation Risk Factor*: *High; Time-Horizon: Long-term Planning*]

9.1. Resiliency or security measures designed collectively to deter, detect, delay, assess, communicate, and respond to potential physical threats and vulnerabilities identified during the evaluation conducted in Requirement R8.

9.2. Law enforcement contact and coordination information.

9.3. A timeline for executing the physical security enhancements and modifications specified in the physical security plan.

9.4. Provisions to evaluate evolving physical threats, and their corresponding security measures, to the Transmission station(s), Transmission substation(s), or primary control center(s).

M9. Examples of evidence may include, but are not limited to, dated written or electronic documentation of its physical security plan(s) that covers their respective identified and verified Transmission station(s), Transmission substation(s), and primary control center(s) as specified in Requirement R6, and additional evidence demonstrating execution of the physical security plan according to the timeline specified in the physical security plan.

R10. Each Transmission Owner that identified a Transmission station, Transmission substation, or primary control center in Requirement R5 and verified according to Requirement R6, and each Transmission Operator notified by a Transmission Owner according to Requirement R7, shall have an unaffiliated third party review the evaluation performed under Requirement R8 and the security plan(s) developed under Requirement R9. The review may occur concurrently with or after completion of the evaluation performed under Requirement R8 and the security plan development under Requirement R9. *[Violation Risk Factor: Medium; Time-Horizon: Long-term Planning]*

10.1. Each Transmission Owner and Transmission Operator shall select an unaffiliated third-party reviewer from the following:

- An entity or organization with electric industry physical security experience and whose review staff has at least one member who holds either a Certified Protection Professional (CPP) or Physical Security Professional (PSP) certification;
- An entity or organization approved by the ERO;
- A governmental agency with physical security expertise; or
- An entity or organization with demonstrated law enforcement, government, or military physical security expertise.

10.2. The Transmission Owner or Transmission Operator, respectively, shall ensure that the unaffiliated third-party review is completed within 90 calendar days of completing the security plan(s) developed in Requirement R9. The unaffiliated third-party review may, but is not required to, include recommended changes to the evaluation performed under Requirement R8 or the security plan(s) developed under Requirement R9.

10.3. If the unaffiliated third-party reviewer recommends changes to the evaluation performed under Requirement R8 or security plan(s) developed under Requirement R9, the Transmission Owner or Transmission Operator shall, within 60 calendar days of the completion of the unaffiliated third party review, for each recommendation:

- Modify its evaluation or security plan(s) consistent with the recommendation; or
- Document the reason(s) for not modifying the evaluation or security plan(s) consistent with the recommendation.

10.4. Each Transmission Owner and Transmission Operator shall implement procedures, such as the use of non-disclosure agreements, for protecting sensitive or confidential information made available to the unaffiliated third-party reviewer and to protect or exempt sensitive or confidential information developed pursuant to this Reliability Standard from public disclosure.

M10. Examples of evidence may include, but are not limited to, written or electronic documentation that the Transmission Owner or Transmission Operator had an unaffiliated third party review the evaluation performed under Requirement R8 and the security plan(s) developed under Requirement R9 as specified in Requirement R10 including, if applicable, documenting the reasons for not modifying the evaluation or security plan(s) in accordance with a recommendation under Part 10.3. Additionally, examples of evidence may include, but are not limited to, written or electronic documentation of procedures to protect information under Part 10.4.

C. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority: "Compliance Enforcement Authority" ~~(CEA)~~ means NERC or the Regional Entity in their respective roles of monitoring and enforcing compliance with the NERC Reliability Standards.

1.2. Evidence Retention: The following evidence retention period(s) identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the Compliance Enforcement Authority ~~CEA~~ may ask an entity to provide other evidence to show that it was compliant for the full-time period since the last audit.

The Transmission Owner and Transmission Operator shall keep data or evidence to show compliance, as identified below, unless directed by its Compliance Enforcement Authority ~~CEA~~ to retain specific evidence for a longer period of time as part of an investigation:

The responsible entities shall retain evidence, as per Requirements R1 through R10, for three years.

If a Responsible Entity is found non-compliant, it shall keep information related to the non-compliance until mitigation is complete and approved, or for the time specified above, whichever is longer.

The CEA shall keep the last audit records and all requested and submitted subsequent audit records.

1.3. Compliance Monitoring and Enforcement Program: "Compliance Monitoring Enforcement Program" or "CMEP" means, depending on the context (1) the NERC Compliance Monitoring and Enforcement Program (Appendix 4C to the NERC Rules of Procedure) or the Commission-approved program of a Regional Entity, as applicable, or (2) the program, department or organization within NERC or a Regional Entity that is responsible for performing compliance monitoring and enforcement activities with respect to Registered Entities' compliance with Reliability Standards.

Violation Severity Levels

	Violation Severity Levels			
	Lower VSL	**Moderate VSL**	**High VSL**	**Severe VSL**
R1.	The Transmission Owner identified each applicable Transmission station(s) ~~or~~ and Transmission substation(s) per Attachment 1, but did so after 36 calendar months, but less than or equal to 38 calendar months. OR The Transmission Owner identified each applicable Transmission station(s) ~~or~~ and Transmission substation(s), but failed to identify less than or equal to 10% of the applicable Transmission station(s) ~~or~~ and Transmission substation(s) per Attachment 1.	The Transmission Owner identified each applicable Transmission station(s) ~~or~~ and Transmission substation(s) per Attachment 1, but did so after 38 calendar months, but less than or equal to 40 calendar months. OR The Transmission Owner identified each applicable Transmission station(s) ~~or~~ and Transmission substation(s), but failed to identify more than 10% and less than or equal to 20% of the applicable Transmission station(s) ~~or~~ and Transmission substation(s) per Attachment 1. Attachment 1 – Applicability Criteria

Applicable Transmission station(s) or Transmission substation(s) are those that meet any of the following criteria:

1. Transmission Facilities operated at 500 kV or higher. For the purpose of this criterion, the collector bus for a generation plant is not considered a Transmission Facility, but is part of the generation interconnection Facility.

2. Transmission Facilities that are operating between 200 kV and 499 kV at a single station or substation, where the station or substation is connected at 200 kV or higher voltages to three or more other Transmission stations or substations and has an "aggregate weighted value" exceeding 3,000 according to the table below. The "aggregate weighted value" for a single station or substation is determined by summing the "weight value per line" shown in the table below for each incoming and each outgoing Bulk Electric System~~BES~~ Transmission Line that is connected to another Transmission station or substation. For the purpose of this criterion, the collector bus for a generation plant is not considered a Transmission Facility, but is part of the generation interconnection Facility.

Voltage Value of a Line	Weight Value per Line
less than 200 kV (not applicable)	(not applicable)
200 kV to 299 kV	700
300 kV to 499 kV	1,300
500 kV and above	N/A

3. Transmission Facilities at a single station or substation location that are identified by ~~its~~ their Reliability Coordinator, Planning Coordinator, or Transmission Planner as critical to the derivation of Interconnection Reliability Operating Limits (IROLs) and their associated contingencies.

4. Transmission Facilities identified as essential to meeting Nuclear Plant Interface Requirements (NPIRs).

Standard Development Timeline

This section is maintained by the drafting team during the development of the standard and will be removed when the standard is adopted by the NERC Board of Trustees (Board).

Description of Current Draft

CIP-014-4 is posted for a 45-day formal comment period with additional ballot.

Completed Actions	Date
Standards Committee approved Standard Authorization Request (SAR) for posting	June 21, 2023
SAR posted for comment	July 26, 2023 – August 24, 2023
Accepted Revised SAR	January 17, 2024
45-day formal or informal comment period with ballot	May 20, 2024 – July 3, 2024
45-day formal or informal comment period with additional ballot	September 23, 2024 – November 6, 2024
45-day formal comment period with additional ballot	June 6, 2025 – July 21, 2025

Anticipated Actions	Date
45-day formal comment period with additional ballot	March 31, 2026 – May 14, 2026

Board adoption	October 8, 2026

New or Modified Term(s) Used in NERC Reliability Standards

This section includes all new or modified terms used in the proposed standard that will be included in the *Glossary of Terms Used in NERC Reliability Standards* upon applicable regulatory approval. Terms used in the proposed standard that are already defined and are not being modified can be found in the *Glossary of Terms Used in NERC Reliability Standards*. The new or revised terms listed below will be presented for approval along with the proposed standard. Upon Board adoption, this section will be removed.

Term(s):

None.

A. Introduction

1. **Title:** Physical Security

2. **Number:** CIP-~~014-3~~014-4

3. **Purpose:** To identify and protect Transmission stations and Transmission substations, and their associated primary control centers, that if rendered inoperable or damaged ~~as a result of~~due to a physical attack, could result in instability, uncontrolled separation, or Cascading within an Interconnection.

4. **Applicability:**

   4.1. Functional Entities:

   4.1.1. ~~**4.1.1**~~ Transmission Owner that owns ~~**a**~~or jointly owns one or more Transmission ~~**station**~~stations or Transmission ~~**substation that meets any of the following**~~substations that meet the applicability criteria~~:~~ of Attachment 1.

   ~~**4.1.1.1** Transmission Facilities operated at 500 kV or higher. For the purpose of this criterion, the collector bus for a generation plant is not considered a Transmission Facility, but is part of the generation interconnection Facility.~~

   ~~**4.1.1.2** Transmission Facilities that are operating between 200 kV and 499 kV at a single station or substation, where the station or substation is connected at 200 kV or higher voltages to three or more other Transmission stations or substations and has an "aggregate weighted value" exceeding 3000 according to the table below. The "aggregate weighted value" for a single station or substation is determined by summing the "weight value per line" shown in the table below for each incoming and each outgoing BES Transmission Line that is connected to another Transmission station or substation. For the purpose of this criterion, the collector bus for a generation plant is not considered a Transmission Facility, but is part of the generation interconnection Facility.~~

~~**Voltage Value of a Line**~~	~~**Weight Value per Line**~~
~~less than 200 kV (not applicable)~~	~~(not applicable)~~
~~200 kV to 299 kV~~	~~700~~
~~300 kV to 499 kV~~	~~1300~~
~~500 kV and above~~	~~0~~

   ~~**4.1.1.3** Transmission Facilities at a single station or substation location that are identified by its Reliability Coordinator, Planning Coordinator, or Transmission Planner as critical to the derivation of Interconnection~~

~~Reliability Operating Limits (IROLs) and their associated contingencies.~~

~~**4.1.1.4** Transmission Facilities identified as essential to meeting Nuclear Plant Interface Requirements.~~

4.1.2. ~~**4.1.2**~~ Transmission Operator~~.~~

Exemption: Facilities in a "protected area," as defined in 10 C.F.R. § 73.2, within the scope of a security plan approved or accepted by the Nuclear Regulatory Commission ~~(NRC)~~ are not subject to this Standard; or~~,~~ Facilities within the scope of a security plan approved or accepted by the Canadian Nuclear Safety Commission are not subject to this Reliability Standard.

5. ~~5.~~ Effective ~~Dates~~Date:

See Implementation Plan for CIP-~~014-2~~014-4.

~~6. Background:~~

~~This Reliability Standard addresses the directives from the FERC order issued March 7, 2014, *Reliability Standards for Physical Security Measures*, 146 FERC ¶ 61,166 (2014), which required NERC to develop a physical security reliability standard(s) to identify and protect facilities that if rendered inoperable or damaged could result in instability, uncontrolled separation, or Cascading within an Interconnection~~

B. Requirements and Measures

R1. Each Transmission Owner shall, at least once every 36 calendar months, identify each applicable Transmission station and Transmission substation meeting any of the criteria in Attachment 1 that is either existing or planned to be in service within 36 calendar months. *[Violation Risk Factor: High; Time-Horizon: Long-term Planning]*

M1. Examples of evidence may include, but are not limited to, dated written or electronic documentation of the Transmission station(s) and Transmission substation(s) (existing and those planned to be in service within 36 calendar months) that meet any of the criteria in Attachment 1.

R2. Each Transmission Owner with applicable Transmission station(s) or Transmission substation(s) identified in Requirement R1 shall identify proximate existing Bulk Electric System Transmission station(s) and Bulk Electric System Transmission substation(s), irrespective of ownership, within 1500 feet or 457 meters (the shortest distance, measured substation fence line to substation fence line) of an applicable Transmission station or Transmission substation identified in Requirement R1. *[Violation Risk Factor: Medium; Time-Horizon: Long-term Planning]*

M2. Examples of evidence may include, but are not limited to, dated written or electronic documentation of the Bulk Electric System Transmission stations or Bulk Electric System Transmission substations identified in Requirement R2.

R3. Each Transmission Owner shall have a documented risk assessment methodology for evaluating the loss of each applicable Transmission station or Transmission substation identified in Requirement R1. The methodology shall include, at a minimum, the following: *[Violation Risk Factor: High; Time-Horizon: Long-term Planning]*

3.1. Documented criteria for assessing instability, uncontrolled separation, or Cascading within an Interconnection. The criteria shall include, at a minimum, technically justified thresholds identifying unacceptable generation and load loss within an Interconnection.

3.2. A provision that steady-state and dynamic simulations shall each be performed using at a minimum one System peak Load case and one System Off-Peak Load case.

3.3. Specifications for simulations at each applicable Transmission station or Transmission substation identified in accordance with Requirement R1 and, if applicable, at each associated proximate existing Bulk Electric System Transmission station(s) and Bulk Electric System Transmission substation(s) identified in accordance with Requirement R2, that include:

3.3.1. At the applicable Transmission station or Transmission substation:

3.3.1.1. Prior loss of communication and Protection Systems;

3.3.1.2. Application of a Fault or Faults; and

3.3.1.3. Delayed (remote) clearing times shall be used unless otherwise technically substantiated.

3.3.2. At each proximate existing Bulk Electric System Transmission station(s) and Bulk Electric System Transmission substation(s), as applicable:

3.3.2.1. Application of a Fault or Faults, either simultaneous with or following the Fault or Faults applied under Part 3.3.1.2; and

3.3.2.2. Normal clearing times shall be used unless otherwise technically substantiated.

3.3.3. A documented justification for the Fault(s) associated with physical attack to be simulated. A single justification may be used for multiple locations. The justification shall include at a minimum:

3.3.3.1. The type of credible high-severity physical attack considered; and

3.3.3.2. The type of Fault(s) selected based upon the attack considered.

3.3.4. Removal of all Elements that Protection Systems and other controls are expected to automatically disconnect.

3.3.5. Actual or more conservative clearing times shall be used.

M3. Each Transmission Owner shall provide dated evidence, such as electronic or hard copies, of a risk assessment methodology satisfying Requirement R3.

R4. Each Transmission Owner with applicable Transmission station(s) and Transmission substation(s) identified in Requirement R1 jointly owned by multiple Transmission Owners shall coordinate with each appropriate Transmission Owner(s) to determine and document their individual and joint responsibilities under Requirement R3 and Requirement R5. *[Violation Risk Factor: Medium; Time-Horizon: Operations Planning, Long-term Planning]*

M4. Examples of acceptable evidence may include, but are not limited to, dated documentation, such as meeting minutes, agreements, and email correspondence, that identifies that agreement has been reached on individual and joint responsibilities for performing the required risk assessments.

R5. At least once every 36 calendar months, each Transmission Owner shall perform a risk assessment to identify applicable Transmission station(s) and Transmission substation(s) identified in Requirement R1, that if rendered inoperable or damaged could result in instability, uncontrolled separation, or Cascading within an Interconnection, using the methodology established in Requirement R3. Jointly

owned Transmission station(s) and Transmission substation(s) shall be assessed according to the responsibilities documented under Requirement R4. If proximate Bulk Electric System Transmission station(s) and Bulk Electric System Transmission substation(s) were identified in Requirement R2, they shall be included in the risk assessment according to Requirement R3, Part 3.3. *[Violation Risk Factor: High; Time-Horizon: Operations Planning, Long-term Planning]*

5.1. If during a risk assessment, a Transmission station or Transmission substation is identified in either the dynamic or steady-state simulation as causing instability, uncontrolled separation, or Cascading within an Interconnection when rendered inoperable or damaged, then no further simulation is required.

5.2. If a previous risk assessment has identified a Transmission station or Transmission substation as causing instability, uncontrolled separation, or Cascading within an Interconnection when rendered inoperable or damaged, then the Transmission Owner may forgo additional assessments on that Transmission station or Transmission substation. Requirement R5, Part 5.3 and Requirement R7 through Requirement R10 still apply to that Transmission station or Transmission substation until a new risk assessment demonstrates otherwise.

5.3. The Transmission Owner shall identify the primary control center that operationally controls each Transmission station or Transmission substation identified as causing instability, uncontrolled separation, or Cascading within an Interconnection when rendered inoperable or damaged in the Requirement R5 risk assessment.

M5. Examples of acceptable evidence may include, but are not limited to, dated written or electronic documentation of the risk assessment satisfying Requirement R5 including the identified Transmission station(s) or Transmission substation(s). For Requirement R5, Part 5.3, examples of acceptable evidence may include, but are not limited to, dated written or electronic documentation of the identification of the primary control center that operationally controls each identified Transmission station or Transmission substation.

R6. ~~**R2.**~~ Each Transmission Owner shall have an unaffiliated third party verify the risk assessment performed under Requirement ~~R1~~R5. The verification may occur ~~concurrent~~concurrently with or after the risk assessment performed under Requirement ~~R1. *[VRF*~~R5. *[Violation Risk Factor: Medium; Time-Horizon: Long-term Planning]*

6.1. ~~**2.1.**~~ Each Transmission Owner shall select an unaffiliated verifying entity that is either:

- A registered Planning Coordinator, Transmission Planner, or Reliability Coordinator; or
- An entity that has transmission planning or analysis experience.

6.2. ~~**2.2.**~~ The unaffiliated ~~third party~~third-party verification shall verify the Transmission Owner's risk assessment performed under Requirement ~~R1~~R5, which may include recommendations for the addition or deletion of a Transmission station(s) or Transmission substation(s). The Transmission Owner shall ensure the verification is completed within 90 calendar days following the completion of the Requirement ~~R1~~R5 risk assessment.

6.3. ~~**2.3.**~~ If the unaffiliated verifying entity recommends that the Transmission Owner add a Transmission station(s) or Transmission substation(s) to, or remove a Transmission station~~(s)~~ or Transmission substation~~(s)~~ from, its identification under Requirement ~~R1~~R5, the Transmission Owner shall either, within 60 calendar days of completion of the verification, for each recommended addition or removal of a Transmission station or Transmission substation:

- Modify its identification under Requirement ~~R1~~R5 consistent with the recommendation; or
- Document the technical basis for not modifying the identification in accordance with the recommendation.

6.4. ~~**2.4.**~~ Each Transmission Owner shall implement procedures, such as the use of non-disclosure agreements, for protecting sensitive or confidential information made available to the unaffiliated ~~third party~~third-party verifier and to protect or exempt sensitive or confidential information developed pursuant to this Reliability Standard from public disclosure.

M6. ~~**M2.**~~ Examples of acceptable evidence may include, but are not limited to, dated written or electronic documentation that the Transmission Owner completed an unaffiliated third party verification of the Requirement ~~R1~~R5 risk assessment and satisfied all of the applicable provisions of Requirement ~~R2~~R6, including, if applicable, documenting the technical basis for not modifying the ~~Requirement R1~~ identification in Requirements R1, R2, R3, R4, and R5 as specified under Part ~~2.3~~6.3. Additionally, examples of evidence may include, but are not limited to, written or electronic documentation of procedures to protect information under Part ~~2.4~~6.4.

R7. ~~**R3.**~~ For a primary control center(s) identified by the Transmission Owner according to Requirement ~~R1~~R5, Part ~~1.2~~5.3 that a) operationally controls an identified Transmission station or Transmission substation verified according to Requirement ~~R2~~R6, and b) is not under the operational control of the Transmission Owner: the Transmission Owner shall, within seven calendar days following completion of Requirement ~~R2~~R6, notify the Transmission Operator that has operational control of the primary control center of such identification and the date of completion of Requirement ~~R2. *[VRF*~~R6. *[Violation Risk Factor: Lower; Time-Horizon: Long-term Planning]*

7.1. ~~**3.1.**~~ If a Transmission station or Transmission substation previously identified under ~~Requirement~~Requirements R1 and R5 and verified according to Requirement ~~R2~~R6 is removed from the identification during a subsequent risk

assessment performed according to Requirement ~~R1~~R5 or a verification according to Requirement ~~R2~~R6, then the Transmission Owner shall, within seven calendar days following the verification or the subsequent risk assessment, notify the Transmission Operator that has operational control of the primary control center of the removal.

M7. ~~**M3.**~~ Examples of acceptable evidence may include, but are not limited to, ~~dated~~ written or electronic notifications or communications that the Transmission Owner notified each Transmission Operator, as applicable, according to Requirement ~~R3~~R7.

R8. ~~**R4.**~~ Each Transmission Owner that identified a Transmission station, Transmission substation, or a primary control center in Requirement ~~R1~~R5 and verified according to Requirement ~~R2~~R6, and each Transmission Operator notified by a Transmission Owner according to Requirement ~~R3~~R7, shall conduct an evaluation of the potential threats and vulnerabilities of a physical attack to each of their respective Transmission station(s), Transmission substation(s), and primary control center(s) identified in Requirement ~~R1~~R5 and verified according to Requirement ~~R2~~R6. The evaluation shall consider the following: *[~~VRF~~Violation Risk Factor: Medium; Time-Horizon: Operations Planning, Long-term Planning]*

8.1. ~~**4.1.**~~ Unique characteristics of the identified and verified Transmission station(s), Transmission substation(s), and primary control center(s);

8.2. ~~**4.2.**~~ Prior history of attack(s) on similar facilities taking into account the frequency, geographic proximity, and severity of past physical security related events; and

8.3. ~~**4.3.**~~ Intelligence or threat warnings received from sources such as law enforcement, the Electric Reliability Organization (ERO), the Electricity Sector Information Sharing and Analysis Center (~~ES-ISAC~~E-ISAC), U.S. federal and/or Canadian governmental agencies, or their successors.

~~**M4**~~**M8.** Examples of evidence may include, but are not limited to, dated written or electronic documentation that the Transmission Owner or Transmission Operator conducted an evaluation of the potential threats and vulnerabilities of a physical attack to their respective Transmission station(s), Transmission substation(s), and primary control center(s) as specified in Requirement ~~R4~~R8.

R9. ~~**R5.**~~ Each Transmission Owner that identified a Transmission station, Transmission substation, or primary control center in Requirement ~~R1~~R5 and verified according to Requirement ~~R2~~R6, and each Transmission Operator notified by a Transmission Owner according to Requirement ~~R3~~R7, shall develop and implement a documented physical security plan(s) that covers their respective Transmission station(s), Transmission substation(s), and primary control center(s). The physical security plan(s) shall be developed within 120 calendar days following the completion of Requirement ~~R2~~R6 and executed according to the timeline specified in the physical

security plan(s). The physical security plan(s) shall include the following attributes: [~~*VRF*~~*Violation Risk Factor*: *High; Time-Horizon: Long-term Planning*]

9.1. ~~**5.1.**~~ Resiliency or security measures designed collectively to deter, detect, delay, assess, communicate, and respond to potential physical threats and vulnerabilities identified during the evaluation conducted in Requirement ~~R4~~R8.

9.2. ~~**5.2.**~~ Law enforcement contact and coordination information.

9.3. ~~**5.3.**~~ A timeline for executing the physical security enhancements and modifications specified in the physical security plan.

9.4. ~~**5.4.**~~ Provisions to evaluate evolving physical threats, and their corresponding security measures, to the Transmission station(s), Transmission substation(s), or primary control center(s).

~~M5~~M9. Examples of evidence may include, but are not limited to, dated written or electronic documentation of its physical security plan(s) that covers their respective identified and verified Transmission station(s), Transmission substation(s), and primary control center(s) as specified in Requirement ~~R5~~R6, and additional evidence demonstrating execution of the physical security plan according to the timeline specified in the physical security plan.

R10. ~~**R6.**~~ Each Transmission Owner that identified a Transmission station, Transmission substation, or primary control center in Requirement ~~R1~~R5 and verified according to Requirement ~~R2~~R6, and each Transmission Operator notified by a Transmission Owner according to Requirement ~~R3~~R7, shall have an unaffiliated third party review the evaluation performed under Requirement ~~R4~~R8 and the security plan(s) developed under Requirement ~~R5~~R9. The review may occur concurrently with or after completion of the evaluation performed under Requirement ~~R4~~R8 and the security plan development under Requirement ~~R5. [*VRF*~~R9. *[Violation Risk Factor: Medium; Time-Horizon: Long-term Planning]*

10.1. ~~**6.1.**~~ Each Transmission Owner and Transmission Operator shall select an unaffiliated ~~third-party~~third-party reviewer from the following:

- An entity or organization with electric industry physical security experience and whose review staff has at least one member who holds either a Certified Protection Professional (CPP) or Physical Security Professional (PSP) certification~~.~~;
- An entity or organization approved by the ERO~~.~~;
- A governmental agency with physical security expertise~~.~~; or
- An entity or organization with demonstrated law enforcement, government, or military physical security expertise.

10.2. ~~**6.2.**~~ The Transmission Owner or Transmission Operator, respectively, shall ensure that the unaffiliated ~~third-party~~third-party review is completed within 90

calendar days of completing the security plan(s) developed in Requirement ~~R5~~R9. The unaffiliated ~~third party~~third-party review may, but is not required to, include recommended changes to the evaluation performed under Requirement ~~R4~~R8 or the security plan(s) developed under Requirement ~~R5~~R9.

10.3.~~6.3.~~ If the unaffiliated ~~third party~~third-party reviewer recommends changes to the evaluation performed under Requirement ~~R4~~R8 or security plan(s) developed under Requirement ~~R5~~R9, the Transmission Owner or Transmission Operator shall, within 60 calendar days of the completion of the unaffiliated third party review, for each recommendation:

- Modify its evaluation or security plan(s) consistent with the recommendation; or
- Document the reason(s) for not modifying the evaluation or security plan(s) consistent with the recommendation.

10.4.~~6.4.~~ Each Transmission Owner and Transmission Operator shall implement procedures, such as the use of non-disclosure agreements, for protecting sensitive or confidential information made available to the unaffiliated ~~third party~~third-party reviewer and to protect or exempt sensitive or confidential information developed pursuant to this Reliability Standard from public disclosure.

~~M6~~M10. Examples of evidence may include, but are not limited to, written or electronic documentation that the Transmission Owner or Transmission Operator had an unaffiliated third party review the evaluation performed under Requirement ~~R4~~R8 and the security plan(s) developed under Requirement ~~R5~~R9 as specified in Requirement ~~R6~~R10 including, if applicable, documenting the reasons for not modifying the evaluation or security plan(s) in accordance with a recommendation under Part ~~6.3~~10.3. Additionally, examples of evidence may include, but are not limited to, written or electronic documentation of procedures to protect information under Part ~~6.4~~10.4.

C. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority

: ~~As defined in the NERC Rules of Procedure,~~ "Compliance Enforcement Authority" ~~(CEA)~~ means NERC or the Regional Entity in their respective roles of monitoring and enforcing compliance with the NERC Reliability Standards.

~~**1.2. Evidence Retention**~~

1.2. Evidence Retention: The following evidence retention ~~periods~~period(s) identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the Compliance Enforcement Authority ~~CEA~~ may ask an entity to provide other evidence ~~during an on-site visit~~ to show that it was compliant for the ~~full-time~~full-time period since the last audit.

The Transmission Owner and Transmission Operator shall keep data or evidence to show compliance, as identified below, unless directed by its Compliance Enforcement Authority ~~(CEA)~~ to retain specific evidence for a longer period of time as part of an investigation~~.~~:

The responsible entities shall retain ~~documentation as~~ evidence, as per Requirements R1 through R10, for three years.

If a Responsible Entity is found non-compliant, it shall keep information related to the non-compliance until mitigation is complete and approved, or for the time specified above, whichever is longer.

The CEA shall keep the last audit records and all requested and submitted subsequent audit records~~, subject to the confidentiality provisions of Section 1500 of the Rules of Procedure and the provisions of Section 1.4 below~~.

~~**1.3. Compliance Monitoring and Assessment Processes:**~~

~~Compliance Audits~~

~~Self-Certifications~~
~~Spot Checking~~

1.3. Compliance Monitoring and Enforcement Program: "Compliance Monitoring Enforcement Program" or "CMEP" means, depending on the context (1) the NERC Compliance Monitoring and Enforcement Program (Appendix 4C to the NERC Rules of Procedure) or the Commission-approved program of a Regional Entity, as applicable, or (2) the program, department or organization within

NERC or a Regional Entity that is responsible for performing compliance monitoring and enforcement activities with respect to Registered Entities' compliance with Reliability Standards.

Guidelines and Technical Basis

Section 4Attachment 1 — Applicability Criteria

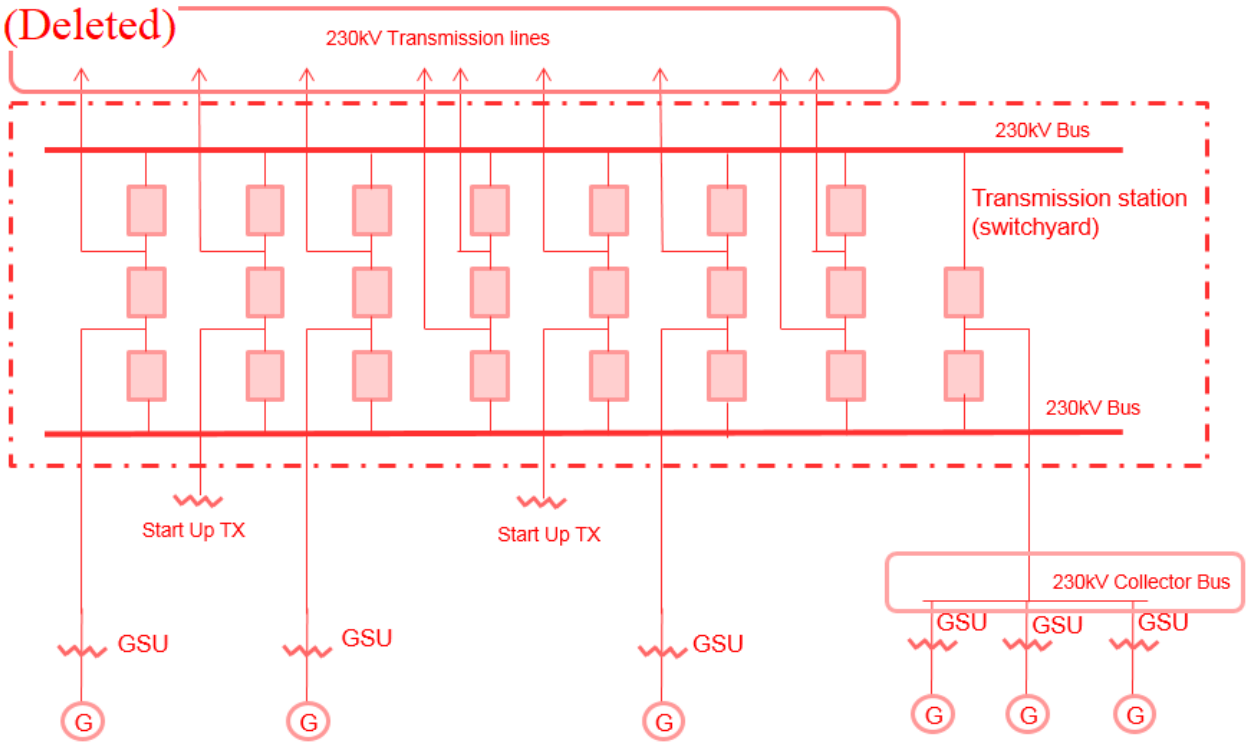
The purpose of Reliability Standard CIP-014 is to protect Transmission stations and Transmission substations, and their associated primary control centers that if rendered inoperable or damaged as a result of a physical attack could result in instability, uncontrolled separation, or Cascading within an Interconnection. To properly include those entities that own or operate such Facilities, the Reliability Standard CIP-014 first applies to Transmission Owners that own Transmission Facilities that meet the specific criteria in Applicability Section 4.1.1.1 through 4.1.1.4. The Facilities described in Applicability Section 4.1.1.1 through 4.1.1.4 mirror those Transmission Facilities that meet the bright line criteria for "Medium Impact" Transmission Facilities under Attachment 1 of Reliability Standard CIP-002-5.1. Each Transmission Owner that owns Transmission Facilities that meet the criteria in Section 4.1.1.1 through 4.1.1.4 is required to perform a risk assessment as specified in Requirement R1 to identify its Transmission stations and Transmission substations, and their associated primary control centers, that if rendered inoperable or damaged as a result of a physical attack could result in instability, uncontrolled separation, or Cascading within an Interconnection. The Standard Drafting Team (SDT) expects this population will be small and that many Transmission Owners that meet the applicability of this standard will not actually identify any such Facilities. Only those Transmission Owners with Transmission stations or Transmission substations identified in the risk assessment (and verified under Requirement R2) have performance obligations under Requirements R3 through R6.

This standard also applies to Transmission Operators. A Transmission Operator's obligations under the standard, however, are only triggered if the Transmission Operator is notified by an applicable Transmission Owner under Requirement R3 that the Transmission Operator operates a primary control center that operationally controls a Transmission station(s) or Transmission substation(s) identified in the Requirement R1 risk assessment. A primary control center operationally controls a Transmission station or Transmission substation when the control center's electronic actions can cause direct physical action at the identified Transmission station or Transmission substation, such as opening a breaker, as opposed to a control center that only has information from the Transmission station or Transmission substation and must coordinate direct action through another entity. Only Transmission Operators who are notified that they have primary control centers under this standard have performance obligations under Requirements R4 through R6. In other words, primary control center for purposes of this Standard is the control center that the Transmission Owner or Transmission Operator, respectively, uses as its primary, permanently manned site to physically operate a Transmission station or Transmission substation that is identified in Requirement R1 and verified in Requirement R2. Control centers that provide back-up capability are not applicable, as they are a form of resiliency and intentionally redundant.

The SDT considered several options for bright line criteria that could be used to determine applicability and provide an initial threshold that defines the set of Transmission stations and Transmission substations that would meet the directives of the FERC order on physical security (*i.e.*, those that could cause instability, uncontrolled separation, or Cascading within an

~~Interconnection). The SDT determined that using the criteria for Medium Impact Transmission Facilities in Attachment 1 of CIP-002-5.1 would provide a conservative threshold for defining which Transmission stations and Transmission substations must be included in the risk assessment in Requirement R1 of CIP-014. Additionally, the SDT concluded that using the CIP-002-5.1 Medium Impact criteria was appropriate because it has been approved by stakeholders, NERC, and FERC, and its use provides a technically sound basis to determine which Transmission Owners should conduct the risk assessment. As described in CIP-002-5.1, the failure of a Transmission station or Transmission substation that meets the Medium Impact criteria could have the capability to result in exceeding one or more Interconnection Reliability Operating Limits (IROLs). The SDT understands that using this bright line criteria to determine applicability may require some Transmission Owners to perform risk assessments under Requirement R1 that will result in a finding that none of their Transmission stations or Transmission substations would pose a risk of instability, uncontrolled separation, or Cascading within an Interconnection. However, the SDT determined that higher bright lines could not be technically justified to ensure inclusion of all Transmission stations and Transmission substations, and their associated primary control centers that, if rendered inoperable or damaged as a result of a physical attack could result in instability, uncontrolled separation, or Cascading within an Interconnection. Further guidance and technical basis for the bright line criteria for Medium Impact Facilities can be found in the Guidelines and Technical Basis section of CIP-002-5.1.~~

~~Additionally, the SDT determined that it was not necessary to include Generator Operators and Generator Owners in the Reliability Standard. First, Transmission stations or Transmission substations interconnecting generation facilities are considered when determining applicability. Transmission Owners will consider those Transmission stations and Transmission substations that include a Transmission station on the high side of the Generator Step-up transformer (GSU) using Applicability Section 4.1.1.1 and 4.1.1.2. As an example, a Transmission station or Transmission substation identified as a Transmission Owner facility that interconnects generation will be subject to the Requirement R1 risk assessment if it operates at 500kV or greater or if it is connected at 200 kV – 499kV to three or more other Transmission stations or Transmission substations and has an "aggregate weighted value" exceeding 3000 according to the table in Applicability Section 4.1.1.2. Second, the Transmission analysis or analyses conducted under Requirement R1 should take into account the impact of the loss of generation connected to applicable Transmission stations or Transmission substations. Additionally, the FERC order does not explicitly mention generation assets and is reasonably understood to focus on the most critical Transmission Facilities. The diagram below shows an example of a station.~~



~~Also, the SDT uses the phrase "Transmission stations or Transmission substations" to recognize the existence of both stations and substations. Many entities in industry consider a substation to be a location with physical borders (i.e. fence, wall, etc.) that contains at least an autotransformer. Locations also exist that do not contain autotransformers, and many entities in industry refer to those locations as stations (switching stations or switchyards). Therefore, the SDT chose to use both "station" and "substation" to refer to the locations where groups of Transmission Facilities exist.~~

~~On the issue of joint ownership, the SDT recognizes that this issue is not unique to CIP-014, and expects that the applicable Transmission Owners and Transmission Operators will develop memorandums of understanding, agreements, Coordinated Functional Registrations, or procedures, etc., to designate responsibilities under CIP-014 when joint ownership is at issue, which is similar to what many entities have completed for other Reliability Standards.~~

~~The language contained in the applicability section regarding the collector bus is directly copied from CIP-002-5.1, Attachment 1, and has no additional meaning within the CIP-014 standard.~~

~~Requirement R1~~

~~The initial risk assessment required under Requirement R1 must be completed on or before the effective date of the standard. Subsequent risk assessments are to be performed at least once every 30 or 60 months depending on the results of the previous risk assessment per Requirement R1, Part 1.1. In performing the risk assessment under Requirement R1, the Transmission Owner should first identify their population of Transmission stations and Transmission substations that meet the criteria contained in Applicability Section 4.1.1.~~

Requirement R1 then requires the Transmission Owner to perform a risk assessment, consisting of a transmission analysis, to determine which of those Transmission stations and Transmission Substations if rendered inoperable or damaged could result in instability, uncontrolled separation, or Cascading within an Interconnection. The requirement is not to require identification of, and thus, not intended to bring within the scope of the standard a Transmission station or Transmission substation unless the applicable Transmission Owner determines through technical studies and analyses based on objective analysis, technical expertise, operating experience and experienced judgment that the loss of such facility would have a critical impact on the operation of the Interconnection in the event the asset is rendered inoperable or damaged. In the November 20, 2014 Order, FERC reiterated that "only an instability that has a "critical impact on the operation of the interconnection" warrants finding that the facility causing the instability is critical under Requirement R1." The Transmission Owner may determine the criteria for critical impact by considering, among other criteria, any of the following:

- Criteria or methodology used by Transmission Planners or Planning Coordinators in TPL-001-4, Requirement R6
- NERC EOP-004-2 reporting criteria
- Area or magnitude of potential impact

The standard does not mandate the specific analytical method for performing the risk assessment. The Transmission Owner has the discretion to choose the specific method that best suites its needs. As an example, an entity may perform a Power Flow analysis and stability analysis at a variety of load levels.

Performing Risk Assessments

The Transmission Owner has the discretion to select a transmission analysis method that fits its facts and system circumstances. To mandate a specific approach is not technically desirable and may lead to results that fail to adequately consider regional, topological, and system circumstances. The following guidance is only an example on how a Transmission Owner may perform a power flow and/or stability analysis to identify those Transmission stations and Transmission substations that if rendered inoperable or damaged as a result of a physical attack could result in instability, uncontrolled separation, or Cascading within an Interconnection. An entity could remove all lines, without regard to the voltage level, to a single Transmission station or Transmission substation and review the simulation results to assess system behavior to determine if Cascading of Transmission Facilities, uncontrolled separation, or voltage or frequency instability is likely to occur over a significant area of the Interconnection. Using engineering judgment, the Transmission Owner (possibly in consultation with regional planning or operation committees and/or ISO/RTO committee input) should develop criteria (e.g. imposing a fault near the removed Transmission station or Transmission substation) to identify a contingency or parameters that result in potential instability, uncontrolled separation, or Cascading within an Interconnection. Regional consultation on these matters is likely to be helpful and informative, given that the inputs for the risk assessment and the attributes of what constitutes instability, uncontrolled separation, or Cascading within an Interconnection will

~~likely vary from region-to-region or from ISO-to-ISO based on topology, system characteristics, and system configurations. Criteria could also include post-contingency facilities loadings above a certain emergency rating or failure of a power flow case to converge. Available special protection systems (SPS), if any, could be applied to determine if the system experiences any additional instability which may result in uncontrolled separation. Example criteria may include:~~

~~(a) Thermal overloads beyond facility emergency ratings;~~

~~(b) Voltage deviation exceeding ± 10%; or~~

~~(c) Cascading outage/voltage collapse; or~~

~~(d) Frequency below under-frequency load-shed points~~

~~Periodicity~~

~~A Transmission Owner who identifies one or more Transmission stations or Transmission substations (as verified under Requirement R2) that if rendered inoperable or damaged could result in instability, uncontrolled separation, or Cascading within an Interconnection is required to conduct a risk assessment at least once every 30 months. This period ensures that the risk assessment remains current with projected conditions and configurations in the planned system. This risk assessment, as the initial assessment, must consider applicable planned Transmission stations and Transmission substations to be in service within 24 months. The 30 month timeframe aligns with the 24 month planned to be in service date because the Transmission Owner is provided the flexibility, depending on its planning cycle and the frequency in which it may plan to construct a new Transmission station or Transmission substation to more closely align these dates. The requirement is to conduct the risk assessment at least once every 30 months, so for a Transmission Owner that believes it is better to conduct a risk assessment once every 24 months, because of its planning cycle, it has the flexibility to do so.~~

~~Transmission Owners that have not identified any Transmission stations or Transmission substations (as verified under Requirement R2) that if rendered inoperable or damaged could result in instability, uncontrolled separation, or Cascading within an Interconnection are unlikely to see changes to their risk assessment in the Near-Term Planning Horizon. Consequently, a 60 month periodicity for completing a subsequent risk assessment is specified.~~

~~Identification of Primary Control Centers~~

~~After completing the risk assessment specified in Requirement R1, it is important to additionally identify the primary control center that operationally controls each Transmission station or Transmission substation that if rendered inoperable or damaged could result in instability, uncontrolled separation, or Cascading within an Interconnection. A primary control center "operationally controls" a Transmission station or Transmission substation when the control center's electronic actions can cause direct physical actions at the identified Transmission station and Transmission substation, such as opening a breaker.~~

~~Requirement R2~~

This requirement specifies verification of the risk assessment performed under Requirement R1 by an entity other than the owner or operator of the Requirement R1 risk assessment.

A verification of the risk assessment by an unaffiliated third party, as specified in Requirement R2, could consist of:

1. Certifying that the Requirement R1 risk assessment considers the Transmission stations and Transmission substations identified in Applicability Section 4.1.1.
2. Review of the model used to conduct the risk assessment to ensure it contains sufficient system topology to identify Transmission stations and Transmission substations that if rendered inoperable or damaged could cause instability, uncontrolled separation, or Cascading within an Interconnection.
3. Review of the Requirement R1 risk assessment methodology.

This requirement provides the flexibility for a Transmission Owner to select from unaffiliated registered and non-registered entities with transmission planning or analysis experience to perform the verification of the Requirement R1 risk assessment. The term unaffiliated means that the selected verifying entity cannot be a corporate affiliate (*i.e.*, the verifying or third party reviewer cannot be an entity that corporately controls, is controlled by or is under common control with, the Transmission Owner). The verifying entity also cannot be a division of the Transmission Owner that operates as a functional unit.

The prohibition on registered entities using a corporate affiliate to conduct the verification, however, does not prohibit a governmental entity (e.g., a city, a municipality, a U.S. federal power marketing agency, or any other political subdivision of U.S. or Canadian federal, state, or provincial governments) from selecting as the verifying entity another governmental entity within the same political subdivision. For instance, a U.S. federal power marketing agency may select as its verifier another U.S. federal agency to conduct its verification so long as the selected entity has transmission planning or analysis experience. Similarly, a Transmission Owner owned by a Canadian province can use a separate agency of that province to perform the verification. The verifying entity, however, must still be a third party and cannot be a division of the registered entity that operates as a functional unit.

Requirement R2 also provides that the "verification may occur concurrent with or after the risk assessment performed under Requirement R1." This provision is designed to provide the Transmission Owner the flexibility to work with the verifying entity throughout (*i.e.*, concurrent with) the risk assessment, which for some Transmission Owners may be more efficient and effective. In other words, a Transmission Owner could collaborate with their unaffiliated verifying entity to perform the risk assessment under Requirement R1 such that both Requirement R1 and Requirement R2 are satisfied concurrently. The intent of Requirement R2 is to have an entity other than the owner or operator of the facility to be involved in the risk assessment process and have an opportunity to provide input. Accordingly, Requirement R2 is designed to allow entities the discretion to have a two-step process, where the Transmission Owner performs the risk assessment and subsequently has a third party review that assessment, or a one-step process, where the entity collaborates with a third party to perform the risk assessment.

Characteristics to consider in selecting a third party reviewer could include:

- Registered Entity with applicable planning and reliability functions.
- Experience in power system studies and planning.
- The entity's understanding of the MOD standards, TPL standards, and facility ratings as they pertain to planning studies.
- The entity's familiarity with the Interconnection within which the Transmission Owner is located.

With respect to the requirement that Transmission owners develop and implement procedures for protecting confidential and sensitive information, the Transmission Owner could have a method for identifying documents that require confidential treatment. One mechanism for protecting confidential or sensitive information is to prohibit removal of sensitive or confidential information from the Transmission Owner's site. Transmission Owners could include such a prohibition in a non-disclosure agreement with the verifying entity.

A Technical feasibility study is not required in the Requirement R2 documentation of the technical basis for not modifying the identification in accordance with the recommendation.

On the issue of the difference between a verifier in Requirement R2 and a reviewer in Requirement R6, the SDT indicates that the verifier will confirm that the risk assessment was completed in accordance with Requirement R1, including the number of Transmission stations and substations identified, while the reviewer in Requirement R6 is providing expertise on the manner in which the evaluation of threats was conducted in accordance with Requirement R4, and the physical security plan in accordance with Requirement R5. In the latter situation there is no verification of a technical analysis, rather an application of experience and expertise to provide guidance or recommendations, if needed.

Parts 2.4 and 6.4 require the entities to have procedures to protect the confidentiality of sensitive or confidential information. Those procedures may include the following elements:

1. Control and retention of information on site for third party verifiers/reviewers.
2. Only "need to know" employees, etc., get the information.
3. Marking documents as confidential
4. Securely storing and destroying information when no longer needed.
5. Not releasing information outside the entity without, for example, General Counsel sign-off.

Requirement R3

Some Transmission Operators will have obligations under this standard for certain primary control centers. Those obligations, however, are contingent upon a Transmission Owner first completing the risk assessment specified by Requirement R1 and the verification specified by Requirement R2. Requirement R3 is intended to ensure that a Transmission Operator that has operational control of a primary control center identified in Requirement R1 receive notice so

that the Transmission Operator may fulfill the rest of the obligations required in Requirements R4 through R6. Since the timing obligations in Requirements R4 through R6 are based upon completion of Requirement R2, the Transmission Owner must also include within the notice the date of completion of Requirement R2. Similarly, the Transmission Owner must notify the Transmission Operator of any removals from identification that result from a subsequent risk assessment under Requirement R1 or as a result of the verification process under Requirement R2.

Requirement R4

This requirement requires owners and operators of facilities identified by the Requirement R1 risk assessment and that are verified under Requirement R2 to conduct an assessment of potential threats and vulnerabilities to those Transmission stations, Transmission substations, and primary control centers using a tailored evaluation process. Threats and vulnerabilities may vary from facility to facility based on any number of factors that include, but are not limited to, location, size, function, existing physical security protections, and attractiveness as a target.

In order to effectively conduct a threat and vulnerability assessment, the asset owner may be the best source to determine specific site vulnerabilities, but current and evolving threats may best be determined by others in the intelligence or law enforcement communities. A number of resources have been identified in the standard, but many others exist and asset owners are not limited to where they may turn for assistance. Additional resources may include state or local fusion centers, U.S. Department of Homeland Security, Federal Bureau of Investigations (FBI), Public Safety Canada, Royal Canadian Mounted Police, and InfraGard chapters coordinated by the FBI.

The Responsible Entity is required to take a number of factors into account in Parts 4.1 to 4.3 in order to make a risk-based evaluation under Requirement R4.

To assist in determining the current threat for a facility, the prior history of attacks on similarly protected facilities should be considered when assessing probability and likelihood of occurrence at the facility in question.

Resources that may be useful in conducting threat and vulnerability assessments include:

- NERC Security Guideline for the Electricity Sector: Physical Security.
- NERC Security Guideline: Physical Security Response.
- ASIS International General Risk Assessment Guidelines.
- ASIS International Facilities Physical Security Measure Guideline.
- ASIS International Security Management Standard: Physical Asset Protection.
- Whole Building Design Guide - Threat/Vulnerability Assessments.

Requirement R5

This requirement specifies development and implementation of a security plan(s) designed to protect against attacks to the facilities identified in Requirement R1 based on the assessment performed under Requirement R4.

Requirement R5 specifies the following attributes for the physical security plan:

- *Resiliency or security measures designed collectively to deter, detect, delay, assess, communicate, and respond to potential physical threats and vulnerabilities identified during the evaluation conducted in Requirement R4.*

  Resiliency may include, among other things:

  a. System topology changes,

  b. Spare equipment,

  c. Construction of a new Transmission station or Transmission substation.

  While most security measures will work together to collectively harden the entire site, some may be allocated to protect specific critical components. For example, if protection from gunfire is considered necessary, the entity may only install ballistic protection for critical components, not the entire site.

- *Law enforcement contact and coordination information.*

  Examples of such information may be posting 9-1-1 for emergency calls and providing substation safety and familiarization training for local and federal law enforcement, fire department, and Emergency Medical Services.

- *A timeline for executing the physical security enhancements and modifications specified in the physical security plan.*

  Entities have the flexibility to prioritize the implementation of the various resiliency or security enhancements and modifications in their security plan according to risk, resources, or other factors. The requirement to include a timeline in the physical security plan for executing the actual physical security enhancements and modifications does not also require that the enhancements and modifications be completed within 120 days. The actual timeline may extend beyond the 120 days, depending on the amount of work to be completed.

- *Provisions to evaluate evolving physical threats, and their corresponding security measures, to the*Applicable Transmission station(s), or Transmission substation(s), *or primary control center(s).* are those that meet any of the following criteria:

1. Transmission Facilities operated at 500 kV or higher. For the purpose of this criterion, the collector bus for a generation plant is not considered a Transmission Facility, but is part of the generation interconnection Facility.

2. Transmission Facilities that are operating between 200 kV and 499 kV at a single station or substation, where the station or substation is connected at 200 kV or higher voltages to three or more other Transmission stations or substations and has an "aggregate weighted value" exceeding 3000 according to the table below. The "aggregate weighted value" for a

single station or substation is determined by summing the "weight value per line" shown in the table below for each incoming and each outgoing BES Transmission Line that is connected to another Transmission station or substation. For the purpose of this criterion, the collector bus for a generation plant is not considered a Transmission Facility, but is part of the generation interconnection Facility.

A registered entity's physical security plan should include processes and responsibilities for obtaining and handling alerts, intelligence, and threat warnings from various sources. Some of these sources could include the ERO, ES-ISAC, and US and/or Canadian federal agencies. This information should be used to reevaluate or consider changes in the security plan and corresponding security measures of the security plan found in R5.

Incremental changes made to the physical security plan prior to the next required third party review do not require additional third party reviews.

Voltage Value of a Line	Weight Value per Line
less than 200 kV (not applicable)	(not applicable)
200 kV to 299 kV	700
300 kV to 499 kV	1300
500 kV and above	N/A

Requirement R6

This requirement specifies review by an entity other than the Transmission Owner or Transmission Operator with appropriate expertise for the evaluation performed according to Requirement R4 and the security plan(s) developed according to Requirement R5. As with Requirement R2, the term unaffiliated means that the selected third party reviewer cannot be a corporate affiliate (*i.e.*, the third party reviewer cannot be an entity that corporately controls, is controlled by or is under common control with, the Transmission Operator). A third party reviewer also cannot be a division of the Transmission Operator that operates as a functional unit.

As noted in the guidance for Requirement R2, the prohibition on registered entities using a corporate affiliate to conduct the review, however, does not prohibit a governmental entity from selecting as the third party reviewer another governmental entity within the same political subdivision. For instance, a city or municipality may use its local enforcement agency, so long as the local law enforcement agency satisfies the criteria in Requirement R6. The third party reviewer, however, must still be a third party and cannot be a division of the registered entity that operates as a functional unit.

The Responsible Entity can select from several possible entities to perform the review:

- *An entity or organization with electric industry physical security experience and whose review staff has at least one member who holds either a Certified Protection Professional (CPP) or Physical Security Professional (PSP) certification.*

  In selecting CPP and PSP for use in this standard, the SDT believed it was important that if a private entity such as a consulting or security firm was engaged to conduct the third party review, they must tangibly demonstrate competence to conduct the review. This includes electric industry physical security experience and either of the premier security industry certifications sponsored by ASIS International. The ASIS certification program was initiated in 1977, and those that hold the CPP certification are board certified in security management. Those that hold the PSP certification are board certified in physical security.

- *An entity or organization approved by the ERO.*

- *A governmental agency with physical security expertise.*

- *An entity or organization with demonstrated law enforcement, government, or military physical security expertise.*

As with the verification under Requirement R2, Requirement R6 provides that the "review may occur concurrently with or after completion of the evaluation performed under Requirement R4 and the security plan development under Requirement R5." This provision is designed to provide applicable Transmission Owners and Transmission Operators the flexibility to work with the third party reviewer throughout (*i.e.*, concurrent with) the evaluation performed according to Requirement R4 and the security plan(s) developed according to Requirement R5, which for some Responsible Entities may be more efficient and effective. In other words, a Transmission Owner or Transmission Operator could collaborate with their unaffiliated third party reviewer to perform an evaluation of potential threats and vulnerabilities (Requirement R4) and develop a security plan (Requirement R5) to satisfy Requirements R4 through R6 simultaneously. The intent of Requirement R6 is to have an entity other than the owner or operator of the facility to be involved in the Requirement R4 evaluation and the development of the Requirement R5 security plans and have an opportunity to provide input on the evaluation and the security plan. Accordingly, Requirement R6 is designed to allow entities the discretion to have a two-step process, where the Transmission Owner performs the evaluation and develops the security plan itself and then has a third party review that assessment, or a one-step process, where the entity collaborates with a third party to perform the evaluation and develop the security plan.

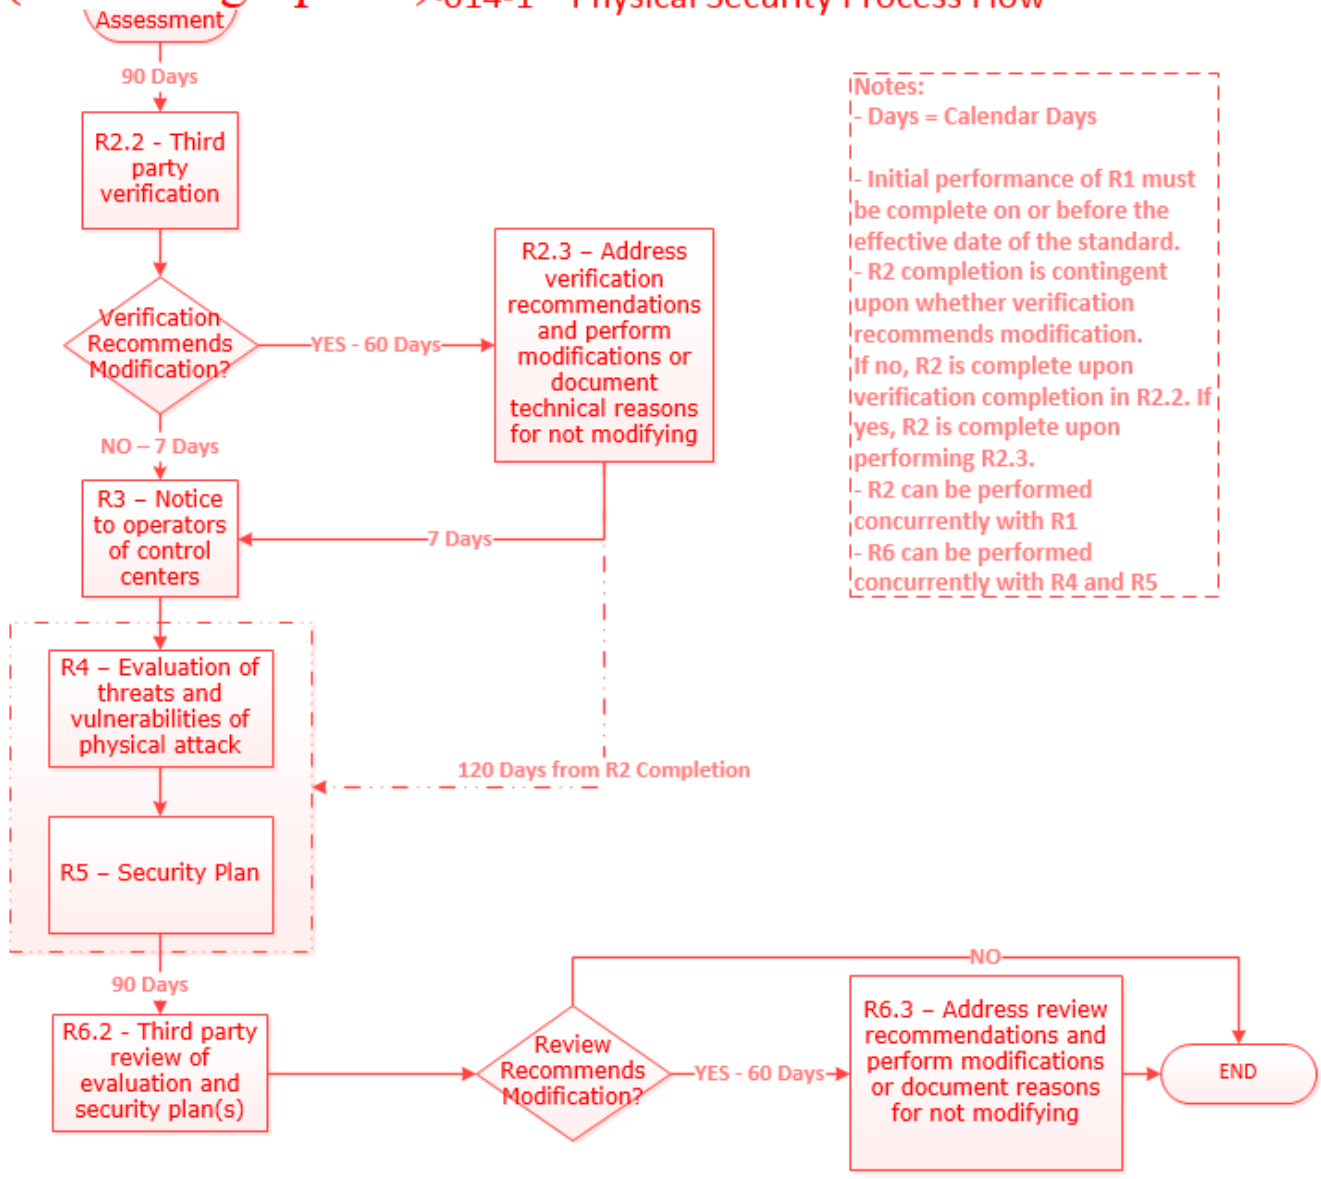
(Deleted graphics)-014-1 – Physical Security Process Flow



Rationale

During development of this standard, text boxes were embedded within the standard to explain the rationale for various parts of the standard. Upon BOT approval, the text from the rationale text boxes was moved to this section.

Rationale for Requirement R1:
This requirement meets the FERC directive from paragraph 6 of its March 7, 2014 order on physical security to perform a risk assessment to identify which facilities if rendered inoperable or damaged could impact an Interconnection through instability, uncontrolled separation, or cascading failures. The requirement is not intended to bring within the scope of the standard a Transmission station or Transmission substation unless the applicable Transmission Owner determines through technical studies and analyses based on objective analysis, technical expertise, operating experience and experienced judgment that the loss of such facility would have a critical impact on the operation of the Interconnection in the event the asset is rendered inoperable or damaged. In the November 20, 2014 Order, FERC reiterated that "only an instability that has a "critical impact on the operation of the interconnection" warrants finding that the facility causing the instability is critical under Requirement R1." The Transmission Owner may determine the criteria for critical impact by considering, among other criteria, any of the following:

- Criteria or methodology used by Transmission Planners or Planning Coordinators in TPL-001-4, Requirement R6
- NERC EOP-004-2 reporting criteria
- Area or magnitude of potential impact

Requirement R1 also meets the FERC directive for periodic reevaluation of the risk assessment by requiring the risk assessment to be performed every 30 months (or 60 months for an entity that has not identified in a previous risk assessment any Transmission stations or Transmission substations that if rendered inoperable or damaged could result in instability, uncontrolled separation, or Cascading within an Interconnection).

After identifying each Transmission station and Transmission substation that meets the criteria in Requirement R1, it is important to additionally identify the primary control center that operationally controls that Transmission station or Transmission substation (*i.e.*, the control center whose electronic actions can cause direct physical actions at the identified Transmission station and Transmission substation, such as opening a breaker, compared to a control center that only has the ability to monitor the Transmission station and Transmission substation and, therefore, must coordinate direct physical action through another entity).

Rationale for Requirement R2:
This requirement meets the FERC directive from paragraph 11 in the order on physical security requiring verification by an entity other than the owner or operator of the risk assessment performed under Requirement R1.

This requirement provides the flexibility for a Transmission Owner to select registered and non-registered entities with transmission planning or analysis experience to perform the verification of the Requirement R1 risk assessment. The term "unaffiliated" means that the selected verifying entity cannot be a corporate affiliate (*i.e.*, the verifying entity cannot be an entity that controls, is controlled by, or is under common control with, the Transmission owner). The verifying entity also cannot be a division of the Transmission Owner that operates as a functional unit. The term "unaffiliated" is not intended to prohibit a governmental entity from using another government entity to be a verifier under Requirement R2.

Requirement R2 also provides the Transmission Owner the flexibility to work with the verifying entity throughout the Requirement R1 risk assessment, which for some Transmission Owners may be more efficient and effective. In other words, a Transmission Owner could coordinate with their unaffiliated verifying entity to perform a Requirement R1 risk assessment to satisfy both Requirement R1 and Requirement R2 concurrently.

Planning Coordinator is a functional entity listed in Part 2.1. The Planning Coordinator and Planning Authority are the same entity as shown in the NERC Glossary of Terms Used in NERC Reliability Standards.

Rationale for Requirement R3:

Some Transmission Operators will have obligations under this standard for certain primary control centers. Those obligations, however, are contingent upon a Transmission Owner first identifying which Transmission stations and Transmission substations meet the criteria specified by Requirement R1, as verified according to Requirement R2. This requirement is intended to ensure that a Transmission Operator that has operational control of a primary control center identified in Requirement R1, Part 1.2 of a Transmission station or Transmission substation verified according to Requirement R2 receives notice of such identification so that the Transmission Operator may timely fulfill its resulting obligations under Requirements R4 through R6. Since the timing obligations in Requirements R4 through R6 are based upon completion of Requirement R2, the Transmission Owner must also include notice of the date of completion of Requirement R2. Similarly, the Transmission Owner must notify the Transmission Operator of any removals from identification that result from a subsequent risk assessment under Requirement R1 or the verification process under Requirement R2.

Rationale for Requirement R4:

This requirement meets the FERC directive from paragraph 8 in the order on physical security that the reliability standard must require tailored evaluation of potential threats and vulnerabilities to facilities identified in Requirement R1 and verified according to Requirement R2. Threats and vulnerabilities may vary from facility to facility based on factors such as the facility's location, size, function, existing protections, and attractiveness of the target. As such, the requirement does not mandate a one-size-fits-all approach but requires entities to account for the unique characteristics of their facilities.

Requirement R4 does not explicitly state when the evaluation of threats and vulnerabilities must occur or be completed. However, Requirement R5 requires that the entity's security plan(s), which is dependent on the Requirement R4 evaluation, must be completed within 120 calendar days following completion of Requirement R2. Thus, an entity has the flexibility when to complete the Requirement R4 evaluation, provided that it is completed in time to comply with the requirement in Requirement R5 to develop a physical security plan 120 calendar days following completion of Requirement R2.

Rationale for Requirement R5:

This requirement meets the FERC directive from paragraph 9 in the order on physical security requiring the development and implementation of a security plan(s) designed to protect against attacks to the facilities identified in Requirement R1 based on the assessment performed under Requirement R4.

Rationale for Requirement R6:

This requirement meets the FERC directive from paragraph 11 in the order on physical security requiring review by an entity other than the owner or operator with appropriate expertise of the evaluation performed according to Requirement R4 and the security plan(s) developed according to Requirement R5.

As with the verification required by Requirement R2, Requirement R6 provides Transmission Owners and Transmission Operators the flexibility to work with the third party reviewer throughout the Requirement R4 evaluation and the development of the Requirement R5 security plan(s). This would allow entities to satisfy their obligations under Requirement R6 concurrent with the satisfaction of their obligations under Requirements R4 and R5.

3. Transmission Facilities at a single station or substation location that are identified by its Reliability Coordinator, Planning Coordinator, or Transmission Planner as critical to the derivation of Interconnection Reliability Operating Limits (IROLs) and their associated contingencies.

4. Transmission Facilities identified as essential to meeting Nuclear Plant Interface Requirements (NPIRs).

Attachment 1 – Applicability Criteria

Applicable Transmission station(s) or Transmission substation(s) are those that meet any of the following criteria:

1. Transmission Facilities operated at 500 kV or higher. For the purpose of this criterion, the collector bus for a generation plant is not considered a Transmission Facility, but is part of the generation interconnection Facility.

2. Transmission Facilities that are operating between 200 kV and 499 kV at a single station or substation, where the station or substation is connected at 200 kV or higher voltages to three or more other Transmission stations or substations and has an "aggregate weighted value" exceeding 3,000 according to the table below. The "aggregate weighted value" for a single station or substation is determined by summing the "weight value per line" shown in the table below for each incoming and each outgoing Bulk Electric System Transmission Line that is connected to another Transmission station or substation. For the purpose of this criterion, the collector bus for a generation plant is not considered a Transmission Facility, but is part of the generation interconnection Facility.

Voltage Value of a Line	Weight Value per Line
less than 200 kV (not applicable)	(not applicable)
200 kV to 299 kV	700
300 kV to 499 kV	1,300
500 kV and above	N/A

3. Transmission Facilities at a single station or substation location that are identified by their Reliability Coordinator, Planning Coordinator, or Transmission Planner as critical to the derivation of Interconnection Reliability Operating Limits (IROLs) and their associated contingencies.

4. Transmission Facilities identified as essential to meeting Nuclear Plant Interface Requirements (NPIRs).

NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

Implementation Plan

Project 2023-06 CIP-014 Risk Assessment Refinement
Reliability Standard CIP-014-4

Applicable Standard(s)

- CIP-014-4 Physical Security

Requested Retirement(s)

- CIP-014-3 Physical Security

Applicable Entities

- Transmission Owner that owns or jointly owns one or more Transmission stations or Transmission substations that meet the applicability criteria of Attachment 1.
- Transmission Operator

  Exemption: Facilities in a "protected area," as defined in 10 C.F.R. § 73.2, within the scope of a security plan approved or accepted by the Nuclear Regulatory Commission are not subject to this Standard; or Facilities within the scope of a security plan approved or accepted by the Canadian Nuclear Safety Commission are not subject to this Reliability Standard.

General Considerations

In developing this Implementation Plan, the Drafting Team (DT) has determined that 24 calendar months for the CIP-014-4 implementation plan would allow adequate time for Transmission Owners and Transmission Operators to determine applicability, develop criteria, write or revise methodologies, perform assessments, and procure unaffiliated third parties for risk assessment verification (which some Transmission Owners have performed concurrently with their risk assessment analyses).

In determining an appropriate time frame, the DT considered the severity of the concerns highlighted in the FERC's December 2022 order, which directed NERC to evaluate the effectiveness of CIP-014-3 in mitigating the risks to the bulk power system associated with physical attacks. (1) (*N. Am. Elec. Reliability Corp*., 181 FERC ¶ 61,230 (2022) (December 2022 Order); (2) the recommendations of the NERC report entitled *Evaluation of the Physical Security Reliability Standard and Physical Security Attacks to the Bulk-Power System* (*See* NERC Report on CIP-014-3.pdf, filed with FERC on April 14, 2023); and (3) the Standard Authorization Request requirement that the DT correct any discrepancies between the study period, frequency of study, and the base case(s) a TO uses. The DT determined that an Implementation Plan schedule of 24 calendar months appropriately balances the reliability need and risks against the time and resources required of

entities to determine applicability, develop criteria, write or revise methodologies, perform assessments, and procure unaffiliated third parties for risk assessment verification.

Effective Date of CIP-014-4

Where approval by an applicable governmental authority (AGA) is required, Reliability Standard CIP-014-4 shall become effective on the first day of the first calendar quarter that is 24 calendar months after the effective date of the AGA's order approving the standard or as otherwise provided for by the AGA.

Where approval by an AGA is not required, Reliability Standard CIP-014-4 shall become effective on the first day of the first calendar quarter that is 24 calendar months after the date the standard is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.

Initial Performance of Periodic Requirements

The initial risk assessment required by Reliability Standard CIP-014-4 Requirement R5, must be completed on or before the effective date of the standard. Subsequent risk assessments shall be performed no later than 36 calendar months following the effective date of Reliability Standard CIP-014-4.

Retirement Date

Reliability Standard CIP-014-3 shall be retired immediately prior to the effective date of Reliability Standard CIP-014-4 in the particular jurisdiction in which the revised standard is becoming effective.

Violation Risk Factor and Violation Severity Level Justifications

Project 2023-06 CIP-014 Risk Assessment Refinement (CIP-014-4)

This document provides the drafting team's justification for assignment of violation risk factors (VRFs) and violation severity levels (VSLs) for each requirement in CIP-014-4 Physical Security. Each requirement is assigned a VRF and a VSL. These elements support the determination of an initial value range for the Base Penalty Amount regarding violations of requirements in FERC-approved Reliability Standards, as defined in the Electric Reliability Organizations (ERO) Sanction Guidelines. The drafting team applied the following NERC criteria and FERC Guidelines when developing the VRFs and VSLs for the requirements.

NERC Criteria for Violation Risk Factors

High Risk Requirement
A requirement that, if violated, could directly cause or contribute to Bulk Electric System instability, separation, or a cascading sequence of failures, or could place the Bulk Electric System at an unacceptable risk of instability, separation, or cascading failures; or, a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly cause or contribute to Bulk Electric System instability, separation, or a cascading sequence of failures, or could place the Bulk Electric System at an unacceptable risk of instability, separation, or cascading failures, or could hinder restoration to a normal condition.

Medium Risk Requirement
A requirement that, if violated, could directly affect the electrical state or the capability of the Bulk Electric System, or the ability to effectively monitor and control the Bulk Electric System. However, violation of a medium risk requirement is unlikely to lead to Bulk Electric System instability, separation, or cascading failures; or, a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or capability of the Bulk Electric System, or the ability to effectively monitor, control, or restore the Bulk Electric System. However, violation of a medium risk requirement is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to Bulk Electric System instability, separation, or cascading failures, nor to hinder restoration to a normal condition.

Lower Risk Requirement
A requirement that is administrative in nature and a requirement that, if violated, would not be expected to adversely affect the electrical state or capability of the Bulk Electric System, or the ability to effectively monitor and control the Bulk Electric System; or, a requirement that is administrative in nature and a requirement in a planning time frame that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to adversely affect the electrical state or capability of the Bulk Electric System, or the ability to effectively monitor, control, or restore the Bulk Electric System.

FERC Guidelines for Violation Risk Factors

Guideline (1) – Consistency with the Conclusions of the Final Blackout Report

FERC seeks to ensure that VRFs assigned to Requirements of Reliability Standards in these identified areas appropriately reflect their historical critical impact on the reliability of the Bulk-Power System. In the VSL Order, FERC listed critical areas (from the Final Blackout Report) where violations could severely affect the reliability of the Bulk-Power System:

- Emergency operations
- Vegetation management
- Operator personnel training
- Protection systems and their coordination
- Operating tools and backup facilities
- Reactive power and voltage control
- System modeling and data exchange
- Communication protocol and facilities
- Requirements to determine equipment ratings
- Synchronized data recorders
- Clearer criteria for operationally critical facilities
- Appropriate use of transmission loading relief.

Guideline (2) – Consistency within a Reliability Standard
FERC expects a rational connection between the sub-Requirement VRF assignments and the main Requirement VRF assignment.

Guideline (3) – Consistency among Reliability Standards
FERC expects the assignment of VRFs corresponding to Requirements that address similar reliability goals in different Reliability Standards would be treated comparably.

Guideline (4) – Consistency with NERC's Definition of the Violation Risk Factor Level
Guideline (4) was developed to evaluate whether the assignment of a particular VRF level conforms to NERC's definition of that risk level.

Guideline (5) – Treatment of Requirements that Co-mingle More Than One Obligation
Where a single Requirement co-mingles a higher risk reliability objective and a lesser risk reliability objective, the VRF assignment for such Requirements must not be watered down to reflect the lower risk level associated with the less important objective of the Reliability Standard.

NERC Criteria for Violation Severity Levels

VSLs define the degree to which compliance with a requirement was not achieved. Each requirement must have at least one VSL. While it is preferable to have four VSLs for each requirement, some requirements do not have multiple "degrees" of non-compliant performance and may have only one, two, or three VSLs.

VSLs should be based on NERC's overarching criteria shown in the table below:

Lower VSL	Moderate VSL	High VSL	Severe VSL
The performance or product measured almost meets the full intent of the requirement.	The performance or product measured meets the majority of the intent of the requirement.	The performance or product measured does not meet the majority of the intent of the requirement, but does meet some of the intent.	The performance or product measured does not substantively meet the intent of the requirement.

FERC Order of Violation Severity Levels

The FERC VSL guidelines are presented below, followed by an analysis of whether the VSLs proposed for each requirement in the standard meet the FERC Guidelines for assessing VSLs:

Guideline (1) – Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance

Compare the VSLs to any prior levels of non-compliance and avoid significant changes that may encourage a lower level of compliance than was required when levels of non-compliance were used.

Guideline (2) – Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties

A violation of a "binary" type requirement must be a "Severe" VSL.
Do not use ambiguous terms such as "minor" and "significant" to describe non-compliant performance.

Guideline (3) – Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement

VSLs should not expand on what is required in the requirement.

Guideline (4) – Violation Severity Level Assignment Should Be Based on a Single Violation, Not on a Cumulative Number of Violations

Unless otherwise stated in the requirement, each instance of non-compliance with a requirement is a separate violation. Section 4 of the Sanction Guidelines states that assessing penalties on a per violation per day basis is the "default" for penalty calculations.

VRF Justifications for CIP-014-4, Requirement R1	
Proposed VRF	**High**
NERC VRF Discussion	A VRF of higher is appropriate because the requirement, if violated, could directly cause or contribute to Bulk Electric System (BES) instability, separation, or a cascading sequence of failures, or could place the BES at an unacceptable risk of instability, separation, or cascading failures. The VRF is revised and unchanged from the last FERC approved version.
FERC VRF G1 Discussion Guideline 1- Consistency with Blackout Report	This VRF is consistent with the identified areas from the FERC list of critical areas in the Final Blackout Report.
FERC VRF G2 Discussion Guideline 2- Consistency within a Reliability Standard	The VRF for Requirement R1 is consistent with those connections between the sub-Requirement VRF assignments and the main Requirement VRF assignment.
FERC VRF G3 Discussion Guideline 3- Consistency among Reliability Standards	This VRF is consistent with other VRFs that address similar reliability goals in different Reliability Standards.
FERC VRF G4 Discussion Guideline 4- Consistency with NERC Definitions of VRFs	This VRF is consistent with the definition of a High VRF requirement per the criteria filed with FERC as part of the ERO's Sanctions Guidelines.
FERC VRF G5 Discussion Guideline 5- Treatment of Requirements that Co-mingle More	This requirement does not mingle a higher risk reliability objective and a lesser risk reliability objective. Therefore, the VRF reflects the risk of the whole requirement.

VRF Justifications for CIP-014-4, Requirement R1	
Proposed VRF	**High**
than One Obligation	

VSLs for CIP-014-4, Requirement R1			
Lower	**Moderate**	**High**	**Severe**
The Transmission Owner identified each applicable Transmission station(s) and Transmission substation(s) per Attachment 1, but did so after 36 calendar months, but less than or equal to 38 calendar months. OR The Transmission Owner identified each applicable Transmission station(s) and Transmission substation(s), but failed to identify less than or equal to 10% of the applicable Transmission station(s) and Transmission substation(s) per Attachment 1.	The Transmission Owner identified each applicable Transmission station(s) and Transmission substation(s) per Attachment 1, but did so after 38 calendar months, but less than or equal to 40 calendar months. OR The Transmission Owner identified each applicable Transmission station(s) and Transmission substation(s), but failed to identify more than 10% and less than or equal to 20% of the applicable Transmission station(s) and Transmission substation(s) per Attachment 1.	The Transmission Owner identified each applicable Transmission station(s) and Transmission substation(s) per Attachment 1, but did so after 40 calendar months, but less than or equal to 42 calendar months. OR The Transmission Owner identified each applicable Transmission station(s) and Transmission substation(s), but failed to identify more than 20% and less than or equal to 30% of the applicable Transmission station(s) and Transmission substation(s) per Attachment 1.	The Transmission Owner failed to identify each applicable Transmission station(s) and Transmission substation(s) per Attachment 1. OR The Transmission Owner identified each applicable Transmission station(s) and Transmission substation(s) per Attachment 1, but did so after more than 42 calendar months. OR The Transmission Owner identified each applicable Transmission station(s) and Transmission substation(s), but failed to identify more than 30% of the applicable Transmission station(s) and Transmission substation(s) per Attachment 1.

VSL Justifications for CIP-014-4, Requirement R1	
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	The proposed VSLs do not have the unintended consequence of lowering the level of compliance.
FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	The proposed VSLs are not binary and do not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.
FERC VSL G3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	The proposed VSLs use the same terminology as used in the associated requirement and are, therefore, consistent with the requirement.
FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	Each VSL is based on a single violation and not cumulative violations.

VRF Justifications for CIP-014-4, Requirement R2	
Proposed VRF	**Medium**
NERC VRF Discussion	A VRF of Medium is appropriate because, if violated, it could directly affect the electrical state or the capability of the BES, or the ability to effectively monitor and control the BES; however, a violation is unlikely to lead to BES instability, separation, or cascading failures.
FERC VRF G1 Discussion Guideline 1- Consistency with Blackout Report	This VRF is consistent with the identified areas from the FERC list of critical areas in the Final Blackout Report.
FERC VRF G2 Discussion Guideline 2- Consistency within a Reliability Standard	The VRF for Requirement R2 is consistent with those connections between the sub-Requirement VRF assignments and the main Requirement VRF assignment.
FERC VRF G3 Discussion Guideline 3- Consistency among Reliability Standards	This VRF is consistent with other VRFs that address similar reliability goals in different Reliability Standards.
FERC VRF G4 Discussion Guideline 4- Consistency with NERC Definitions of VRFs	This VRF is consistent with the definition of a Medium VRF requirement per the criteria filed with FERC as part of the ERO's Sanctions Guidelines.
FERC VRF G5 Discussion Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation	This requirement does not mingle a higher risk reliability objective and a lesser risk reliability objective. Therefore, the VRF reflects the risk of the whole requirement.

VSLs for CIP-014-4, Requirement R2			
Lower	**Moderate**	**High**	**Severe**
N/A	N/A	N/A	The Transmission Owner with applicable Transmission station(s) or Transmission substation(s) identified in Requirement R1 did not identify existing Bulk Electric System Transmission station(s) and Bulk Electric System Transmission substation(s), irrespective of ownership, within 1500 feet or 457 meters (the shortest distance, measured substation fence line to substation fence line) of an applicable Transmission station or Transmission substation identified in Requirement R1.

VSL Justifications for CIP-014-4, Requirement R2	
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	This is a new Requirement and does not have the unintended consequence of lowering the current level of compliance.
FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties	The proposed VSLs are binary and do not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations. The new Requirement R2 is a binary requirement and thus only assigned a Severe VSL because the Transmission Owners either have or have not identified proximate Transmission station(s) and Transmission substation(s), irrespective of ownership, within 1,500 feet or 457 meters (the shortest distance, measured substation fence line to substation fence line) of an applicable Transmission station or Transmission substation identified in Requirement R1.

VSL Justifications for CIP-014-4, Requirement R2	
Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	
FERC VSL G3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	The proposed VSLs use the same terminology as used in the associated requirement and are, therefore, consistent with the requirement.
FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	Each VSL is based on a single violation and not cumulative violations.

VRF Justifications for CIP-014-4, Requirement R3	
Proposed VRF	**High**
NERC VRF Discussion	A VRF of higher is appropriate because the requirement, if violated, could directly cause or contribute to BES instability, separation, or a cascading sequence of failures, or could place the BES at an unacceptable risk of instability, separation, or cascading failures.
FERC VRF G1 Discussion Guideline 1- Consistency with	This VRF is consistent with the identified areas from the FERC list of critical areas in the Final Blackout Report.

VRF Justifications for CIP-014-4, Requirement R3	
Proposed VRF	**High**
Blackout Report	
FERC VRF G2 Discussion Guideline 2- Consistency within a Reliability Standard	The VRF for Requirement R3 is consistent with those connections between the sub-Requirement VRF assignments and the main Requirement VRF assignment.
FERC VRF G3 Discussion Guideline 3- Consistency among Reliability Standards	This VRF is consistent with other VRFs that address similar reliability goals in different Reliability Standards.
FERC VRF G4 Discussion Guideline 4- Consistency with NERC Definitions of VRFs	This VRF is consistent with the definition of a High VRF requirement per the criteria filed with FERC as part of the ERO's Sanctions Guidelines.
FERC VRF G5 Discussion Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation	This requirement does mingle a higher risk reliability objective and risk reliability objective. Therefore, the VRF reflects the risk of the whole requirement.

VSLs for CIP-014-4, Requirement R3			
Lower	**Moderate**	**High**	**Severe**
N/A	The Transmission Owner has a risk assessment methodology that failed to include one of the requirements listed in Parts 3.1 through 3.3.	The Transmission Owner has a risk assessment methodology that failed to include two of the requirements listed in Parts 3.1 through 3.3.	The Transmission Owner has a risk assessment methodology that failed to include all three of the requirements listed in Parts 3.1 through 3.3. OR The Transmission Owner does not

			have a risk assessment methodology.

VSL Justifications for CIP-014-4, Requirement R3	
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	The proposed VSLs do not have the unintended consequence of lowering the level of compliance.
FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	The proposed VSLs are not binary and do not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.
FERC VSL G3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	The proposed VSLs use the same terminology as used in the associated requirement and are, therefore, consistent with the requirement.
FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single	Each VSL is based on a single violation and not cumulative violations.

VSL Justifications for CIP-014-4, Requirement R3	
Violation, Not on A Cumulative Number of Violations	

VRF Justifications for CIP-014-4, Requirement R4	
Proposed VRF	**Medium**
NERC VRF Discussion	A VRF of Medium is appropriate because, if violated, it could directly affect the electrical state or the capability of the BES, or the ability to effectively monitor and control the BES; however, a violation is unlikely to lead to BES instability, separation, or cascading failures.
FERC VRF G1 Discussion Guideline 1- Consistency with Blackout Report	This VRF is consistent with the identified areas from the FERC list of critical areas in the Final Blackout Report.
FERC VRF G2 Discussion Guideline 2- Consistency within a Reliability Standard	The VRF for Requirement R4 is consistent with those connections between the sub-Requirement VRF assignments and the main Requirement VRF assignment.
FERC VRF G3 Discussion Guideline 3- Consistency among Reliability Standards	This VRF is consistent with other VRFs that address similar reliability goals in different Reliability Standards.
FERC VRF G4 Discussion Guideline 4- Consistency with NERC Definitions of VRFs	This VRF is consistent with the definition of a Medium VRF requirement per the criteria filed with FERC as part of the ERO's Sanctions Guidelines.
FERC VRF G5 Discussion Guideline 5- Treatment of Requirements that Co-mingle More	This requirement does not mingle a higher risk reliability objective and a lesser risk reliability objective. Therefore, the VRF reflects the risk of the whole requirement.

VRF Justifications for CIP-014-4, Requirement R4	
Proposed VRF	**Medium**
than One Obligation	

VSLs for CIP-014-4, Requirement R4			
Lower	**Moderate**	**High**	**Severe**
The Transmission Owner with applicable Transmission station(s) and Transmission substation(s) identified in Requirement R1 owned by multiple Transmission Owners failed to coordinate with each appropriate Transmission Owner(s) to determine and document their individual and joint responsibilities for documenting a risk assessment methodology under Requirement R3 and for performing any required risk assessments per Requirement R5 for less than or equal to 25% of jointly owned applicable Transmission station(s) and Transmission substation(s).	The Transmission Owner with applicable Transmission station(s) and Transmission substation(s) identified in Requirement R1 owned by multiple Transmission Owners failed to coordinate with each appropriate Transmission Owner(s) to determine and document their individual and joint responsibilities for documenting a risk assessment methodology under Requirement R3 and for performing any required risk assessments per Requirement R5 for more than 25% and less than or equal to 50% of jointly owned applicable Transmission station(s) and Transmission substation(s).	The Transmission Owner with applicable Transmission station(s) and Transmission substation(s) identified in Requirement owned by multiple Transmission Owners failed to coordinate with each appropriate Transmission Owner(s) to determine and document their individual and joint responsibilities for documenting a risk assessment methodology under Requirement R3 and for performing any required risk assessments per Requirement R5 for more than 50% and less than or equal to 75% of jointly owned applicable Transmission station(s) and Transmission substation(s).	The Transmission Owner with applicable Transmission station(s) and Transmission substation(s) identified in Requirement R1 owned by multiple Transmission Owners failed to coordinate with each appropriate Transmission Owner(s) to determine and document their individual and joint responsibilities for documenting a risk assessment methodology under Requirement R3 and for performing any required risk assessments per Requirement R5 for more than 75% and less than or equal to 100% of any evidence for jointly owned applicable Transmission station(s) and Transmission substation(s).

VSL Justifications for CIP-014-4, Requirement R4	
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	The proposed VSLs do not have the unintended consequence of lowering the level of compliance.
FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	The proposed VSLs are not binary and do not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.
FERC VSL G3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	The proposed VSLs use the same terminology as used in the associated requirement and are, therefore, consistent with the requirement.
FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	Each VSL is based on a single violation and not cumulative violations.

VRF Justifications for CIP-014-4, Requirement R5	
Proposed VRF	**High**
NERC VRF Discussion	The VRF for this new Requirement R5 remains High because it is one of the two sub-Requirements of Requirement R1 from the previously FERC approved CIP-014-3 Reliability Standard.
FERC VRF G1 Discussion Guideline 1- Consistency with Blackout Report	This VRF is consistent with the identified areas from the FERC list of critical areas in the Final Blackout Report.
FERC VRF G2 Discussion Guideline 2- Consistency within a Reliability Standard	The VRF for Requirement R5 is consistent with those connections between the sub-Requirement VRF assignments and the main Requirement VRF assignment.
FERC VRF G3 Discussion Guideline 3- Consistency among Reliability Standards	This VRF is consistent with other VRFs that address similar reliability goals in different Reliability Standards.
FERC VRF G4 Discussion Guideline 4- Consistency with NERC Definitions of VRFs	This VRF is consistent with the definition of a High VRF requirement per the criteria filed with FERC as part of the ERO's Sanctions Guidelines.
FERC VRF G5 Discussion Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation	This requirement does mingle a higher risk reliability objective and risk reliability objective. Therefore, the VRF reflects the risk of the whole requirement.

VSLs for CIP-014-4, Requirement R5			
Lower	**Moderate**	**High**	**Severe**
The Transmission Owner performed a risk assessment, but did so after 36 calendar months, but less than or equal to 38 calendar months.	The Transmission Owner performed a risk assessment, but did so after 38 calendar months, but less than or equal to 40 calendar months. OR The Transmission Owner performed a risk assessment inconsistent with one of the methodology requirements listed in Requirement R3, Parts 3.1 through 3.3.	The Transmission Owner performed a risk assessment, but did so after 40 calendar months, but less than or equal to 42 calendar months. OR The Transmission Owner performed a risk assessment inconsistent with two of the methodology requirements listed in Requirement R3, Parts 3.1 through 3.3. OR The Transmission Owner performed a risk assessment, but failed to include the primary control center identified in Part 5.2.	The Transmission Owner performed a risk assessment, but did so after more than 42 calendar months. OR The Transmission Owner performed a risk assessment inconsistent with all three of the methodology requirements listed in Requirement R3, Parts 3.1 through 3.3.

VSL Justifications for CIP-014-4, Requirement R5	
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	The proposed VSLs do not have the unintended consequence of lowering the level of compliance.
FERC VSL G2 Violation Severity Level Assignments	The proposed VSLs are not binary and do not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.

VSL Justifications for CIP-014-4, Requirement R5	
Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	
FERC VSL G3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	The proposed VSLs use the same terminology as used in the associated requirement and are, therefore, consistent with the requirement.
FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	Each VSL is based on a single violation and not cumulative violations.

VRF Justification for CIP-014-4, Requirement R6

This Requirement is the same as Requirement R2 in CIP-014-3. The VRF did not change from the previously FERC approved CIP-014-3 Reliability Standard.

VSL Justification for CIP-014-4, Requirement R6

The Requirement is the same as Requirement R2 in the previously FERC approved CIP-014-3 Reliability Standard. The VSL did not have material changes except for the reference Requirement numbers because 5 (five) new Requirements were added.

VRF Justification for CIP-014-4, Requirement R7

This Requirement is the same as Requirement R3 in CIP-014-3. The VRF did not change from the previously FERC approved CIP-014-3 Reliability Standard.

VSL Justification for CIP-014-4, Requirement R7

The Requirement is the same as Requirement R3 in the previously FERC approved CIP-014-3 Reliability Standard. The VSL did not have material changes except for the reference Requirement numbers because 5 (five) new Requirements were added.

VRF Justification for CIP-014-4, Requirement R8

This Requirement is the same as Requirement R4 in CIP-014-3. The VRF did not change from the previously FERC approved CIP-014-3 Reliability Standard.

VSL Justification for CIP-014-4, Requirement R8

The Requirement is the same as Requirement R4 in CIP-014-3. The VSL did not have material changes from the previously FERC approved CIP-014-3 Reliability Standard except changed “Responsible Entity” to “responsible entity” and the reference Requirement numbers because 5 (five) new Requirements were added.

VRF Justification for CIP-014-4, Requirement R9

This Requirement is the same as Requirement R5 in CIP-014-3. The VRF did not change from the previously FERC approved CIP-014-3 Reliability Standard.

VSL Justification for CIP-014-4, Requirement R9

The Requirement is the same as Requirement R5 in CIP-014-3. The VSL did not have material change from the previously FERC approved CIP-014-3 Reliability Standard except changed “Responsible Entity” to “responsible entity” and the reference Requirement numbers because 5 (five) new Requirements were added.

VRF Justification for CIP-014-4, Requirement R10

This Requirement is the same as Requirement R6 in CIP-014-3. The VRF did not change from the previously FERC approved CIP-014-3 Reliability Standard.

VSL Justification for CIP-014-4, Requirement R10

VSLs for CIP-014-4, Requirement R10			
Lower	**Moderate**	**High**	**Severe**
The responsible entity had an unaffiliated third party review the evaluation performed under Requirement R8 and the security plan(s) developed under Requirement R9, but did so in more than 90 calendar days, but less than or equal to 100 calendar days. OR The responsible entity had an unaffiliated third party review the evaluation performed under Requirement R8 and the security plan(s) developed under Requirement R9 and modified or documented the reason for not modifying the security plan(s) as specified in Part 10.3, but did so more than 70 calendar days and less than or equal to 80 calendar days following completion of the third party review.	The responsible entity had an unaffiliated third party review the evaluation performed under Requirement R8 and the security plan(s) developed under Requirement R9, but did so in more than 100 calendar days, but less than or equal to 110 calendar days. OR The responsible entity had an unaffiliated third party review the evaluation performed under Requirement R8 and the security plan(s) developed under Requirement R9 and modified or documented the reason for not modifying the security plan(s) as specified in Part 10.3, but did so more than 80 calendar days following completion of the third party review. OR The responsible entity had an unaffiliated third party review the evaluation performed under Requirement R8 and the security plan(s) developed under Requirement R9, but did not document the reason for not	The responsible entity had an unaffiliated third party review the evaluation performed under Requirement R8 and the security plan(s) developed under Requirement R9, but did so more than 110 calendar days, but less than or equal to 120 calendar days. OR The responsible entity failed to have an unaffiliated third party review the evaluation performed under Requirement R8 and the security plan(s) developed under Requirement R9. OR The responsible entity had an unaffiliated third party review the evaluation performed under Requirement R8 and the security plan(s) developed under Requirement R9, but failed to implement procedures for protecting information per Part 10.4.	The responsible entity failed to have an unaffiliated third party review the evaluation performed under Requirement R8 and the security plan(s) developed under Requirement R9 in more than 120 calendar days.

	modifying the security plan(s) as specified in Part 10.3.		

VSL Justifications for CIP-014-4, Requirement R10	
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	This is an existing Requirement. The drafting team revised the VSL language for consistency with the proposed revisions to the standard. All of the violation severity levels stayed the same from the previously FERC-approved version
FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	The proposed VSLs are not binary and do not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.
FERC VSL G3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	The proposed VSLs use the same terminology as used in the associated requirement and are, therefore, consistent with the requirement.
FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative	Each VSL is based on a single violation and not cumulative violations.

Number of Violations

NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

Violation Risk Factor and Violation Severity Level Justifications

Project 2023-06 CIP-014 Risk Assessment Refinement (CIP-014-4)

This document provides the drafting team's (DT's) justification for assignment of violation risk factors (VRFs) and violation severity levels (VSLs) for each requirement in CIP-014-4 Physical Security. Each requirement is assigned a VRF and a VSL. These elements support the determination of an initial value range for the Base Penalty Amount regarding violations of requirements in FERC-approved Reliability Standards, as defined in the Electric Reliability Organizations (ERO) Sanction Guidelines. The SDT applied the following NERC criteria and FERC Guidelines when developing the VRFs and VSLs for the requirements.

NERC Criteria for Violation Risk Factors

High Risk Requirement
A requirement that, if violated, could directly cause or contribute to Bulk Electric System instability, separation, or a cascading sequence of failures, or could place the Bulk Electric System at an unacceptable risk of instability, separation, or cascading failures; or, a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly cause or contribute to Bulk Electric System instability, separation, or a cascading sequence of failures, or could place the Bulk Electric System at an unacceptable risk of instability, separation, or cascading failures, or could hinder restoration to a normal condition.

Medium Risk Requirement
A requirement that, if violated, could directly affect the electrical state or the capability of the Bulk Electric System, or the ability to effectively monitor and control the Bulk Electric System. However, violation of a medium risk requirement is unlikely to lead to Bulk Electric System instability, separation, or cascading failures; or, a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or capability of the Bulk Electric System, or the ability to effectively monitor, control, or restore the Bulk Electric System. However, violation of a medium risk requirement is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to Bulk Electric System instability, separation, or cascading failures, nor to hinder restoration to a normal condition.

Lower Risk Requirement
A requirement that is administrative in nature and a requirement that, if violated, would not be expected to adversely affect the electrical state or capability of the Bulk Electric System, or the ability to effectively monitor and control the Bulk Electric System; or, a requirement that is administrative in nature and a requirement in a planning time frame that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to adversely affect the electrical state or capability of the Bulk Electric System, or the ability to effectively monitor, control, or restore the Bulk Electric System.

FERC Guidelines for Violation Risk Factors

Guideline (1) – Consistency with the Conclusions of the Final Blackout Report

FERC seeks to ensure that VRFs assigned to Requirements of Reliability Standards in these identified areas appropriately reflect their historical critical impact on the reliability of the Bulk-Power System. In the VSL Order, FERC listed critical areas (from the Final Blackout Report) where violations could severely affect the reliability of the Bulk-Power System:

- Emergency operations
- Vegetation management
- Operator personnel training
- Protection systems and their coordination
- Operating tools and backup facilities
- Reactive power and voltage control
- System modeling and data exchange
- Communication protocol and facilities
- Requirements to determine equipment ratings
- Synchronized data recorders
- Clearer criteria for operationally critical facilities
- Appropriate use of transmission loading relief.

Guideline (2) – Consistency within a Reliability Standard
FERC expects a rational connection between the sub-Requirement VRF assignments and the main Requirement VRF assignment.

Guideline (3) – Consistency among Reliability Standards
FERC expects the assignment of VRFs corresponding to Requirements that address similar reliability goals in different Reliability Standards would be treated comparably.

Guideline (4) – Consistency with NERC's Definition of the Violation Risk Factor Level
Guideline (4) was developed to evaluate whether the assignment of a particular VRF level conforms to NERC's definition of that risk level.

Guideline (5) – Treatment of Requirements that Co-mingle More Than One Obligation
Where a single Requirement co-mingles a higher risk reliability objective and a lesser risk reliability objective, the VRF assignment for such Requirements must not be watered down to reflect the lower risk level associated with the less important objective of the Reliability Standard.

NERC Criteria for Violation Severity Levels

VSLs define the degree to which compliance with a requirement was not achieved. Each requirement must have at least one VSL. While it is preferable to have four VSLs for each requirement, some requirements do not have multiple "degrees" of noncompliant performance and may have only one, two, or three VSLs.

VSLs should be based on NERC's overarching criteria shown in the table below:

Lower VSL	Moderate VSL	High VSL	Severe VSL
The performance or product measured almost meets the full intent of the requirement.	The performance or product measured meets the majority of the intent of the requirement.	The performance or product measured does not meet the majority of the intent of the requirement, but does meet some of the intent.	The performance or product measured does not substantively meet the intent of the requirement.

FERC Order of Violation Severity Levels

The FERC VSL guidelines are presented below, followed by an analysis of whether the VSLs proposed for each requirement in the standard meet the FERC Guidelines for assessing VSLs:

Guideline (1) – Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance

Compare the VSLs to any prior levels of non-compliance and avoid significant changes that may encourage a lower level of compliance than was required when levels of non-compliance were used.

Guideline (2) – Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties

A violation of a "binary" type requirement must be a "Severe" VSL.
Do not use ambiguous terms such as "minor" and "significant" to describe noncompliant performance.

Guideline (3) – Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement

VSLs should not expand on what is required in the requirement.

Guideline (4) – Violation Severity Level Assignment Should Be Based on a Single Violation, Not on a Cumulative Number of Violations

Unless otherwise stated in the requirement, each instance of non-compliance with a requirement is a separate violation. Section 4 of the Sanction Guidelines states that assessing penalties on a per violation per day basis is the "default" for penalty calculations.

VRF Justifications for CIP-014-4, Requirement R1	
Proposed VRF	**High**
NERC VRF Discussion	A VRF of higher is appropriate because the requirement, if violated, could directly cause or contribute to Bulk Electric System instability, separation, or a cascading sequence of failures, or could place the Bulk Electric System at an unacceptable risk of instability, separation, or cascading failures. The VRF is revised and unchanged from the last FERC approved version.
FERC VRF G1 Discussion Guideline 1- Consistency with Blackout Report	This VRF is consistent with the identified areas from the FERC list of critical areas in the Final Blackout Report.
FERC VRF G2 Discussion Guideline 2- Consistency within a Reliability Standard	The VRF for Requirement R1 is consistent with those connections between the sub-Requirement VRF assignments and the main Requirement VRF assignment.
FERC VRF G3 Discussion Guideline 3- Consistency among Reliability Standards	This VRF is consistent with other VRFs that address similar reliability goals in different Reliability Standards.
FERC VRF G4 Discussion Guideline 4- Consistency with NERC Definitions of VRFs	This VRF is consistent with the definition of a High VRF requirement per the criteria filed with FERC as part of the ERO's Sanctions Guidelines.
FERC VRF G5 Discussion Guideline 5- Treatment of Requirements that Co-mingle More	This requirement does not mingle a higher risk reliability objective and a lesser risk reliability objective. Therefore, the VRF reflects the risk of the whole requirement.

VRF Justifications for CIP-014-4, Requirement R1	
Proposed VRF	**High**
than One Obligation	

VSLs for CIP-014-4, Requirement R1			
Lower	**Moderate**	**High**	**Severe**
The Transmission Owner identified each applicable Transmission station(s) ~~or~~ and Transmission substation(s) per Attachment 1, but did so after 36 calendar months, but less than or equal to 38 calendar months. OR The Transmission Owner identified each applicable Transmission station(s) ~~or~~ and Transmission substation(s), but failed to identify less than or equal to 10% of the applicable Transmission station(s) ~~or~~ and Transmission substation(s) per Attachment 1.	The Transmission Owner identified each applicable Transmission station(s) ~~or~~ and Transmission substation(s) per Attachment 1, but did so after 38 calendar months, but less than or equal to 40 calendar months. OR The Transmission Owner identified each applicable Transmission station(s) ~~or~~ and Transmission substation(s), but failed to identify more than 10% and less than or equal to 20% of the applicable Transmission station(s) ~~or~~ and Transmission substation(s) per Attachment 1.	The Transmission Owner identified each applicable Transmission station(s) ~~or~~ and Transmission substation(s) per Attachment 1, but did so after 40 calendar months, but less than or equal to 42 calendar months. OR The Transmission Owner identified each applicable Transmission station(s) ~~or~~ and Transmission substation(s), but failed to identify more than 20% and less than or equal to 30% of the applicable Transmission station(s) ~~or~~ and Transmission substation(s) per Attachment 1.	The Transmission Owner failed to identify each applicable Transmission station(s) ~~or~~ and Transmission substation(s) per Attachment 1. OR The Transmission Owner identified each applicable Transmission station(s) ~~or~~ and Transmission substation(s) per Attachment 1, but did so after more than 42 calendar months. OR The Transmission Owner identified each applicable Transmission station(s) ~~or~~ and Transmission substation(s), but failed to identify more than 30% of the applicable Transmission station(s) ~~or~~ and Transmission substation(s) per Attachment 1.

VSL Justifications for CIP-014-4, Requirement R1	
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	The proposed VSLs do not have the unintended consequence of lowering the level of compliance.
FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	The proposed VSLs are not binary and do not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.
FERC VSL G3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	The proposed VSLs use the same terminology as used in the associated requirement and are, therefore, consistent with the requirement.
FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	Each VSL is based on a single violation and not cumulative violations.

VRF Justifications for CIP-014-4, Requirement R2	
Proposed VRF	**Medium**
NERC VRF Discussion	A VRF of Medium is appropriate because, if violated, it could directly affect the electrical state or the capability of the Bulk Electric System, or the ability to effectively monitor and control the Bulk Electric System; however, a violation is unlikely to lead to Bulk Electric System instability, separation, or cascading failures.
FERC VRF G1 Discussion Guideline 1- Consistency with Blackout Report	This VRF is consistent with the identified areas from the FERC list of critical areas in the Final Blackout Report.
FERC VRF G2 Discussion Guideline 2- Consistency within a Reliability Standard	The VRF for Requirement R2 is consistent with those connections between the sub-Requirement VRF assignments and the main Requirement VRF assignment.
FERC VRF G3 Discussion Guideline 3- Consistency among Reliability Standards	This VRF is consistent with other VRFs that address similar reliability goals in different Reliability Standards.
FERC VRF G4 Discussion Guideline 4- Consistency with NERC Definitions of VRFs	This VRF is consistent with the definition of a Medium VRF requirement per the criteria filed with FERC as part of the ERO's Sanctions Guidelines.
FERC VRF G5 Discussion Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation	This requirement does not mingle a higher risk reliability objective and a lesser risk reliability objective. Therefore, the VRF reflects the risk of the whole requirement.

VSLs for CIP-014-4, Requirement R2			
Lower	**Moderate**	**High**	**Severe**
N/A	N/A	N/A	The Transmission Owner with applicable Transmission station(s) or Transmission substation(s) identified in Requirement R1 did not identify ~~proximate~~existing Bulk Electric System Transmission station(s) and Bulk Electric System Transmission substation(s), irrespective of ownership, within 1500 feet or 457 meters (the shortest distance, measured substation fence line to substation fence line) of an applicable Transmission station or Transmission substation identified in Requirement R1.

VSL Justifications for CIP-014-4, Requirement R2	
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	This is a new Requirement and does not have the unintended consequence of lowering the current level of compliance.
FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties	The proposed VSLs are binary and do not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations. The new Requirement R2 is a binary requirement and thus only assigned a Severe VSL because the Transmission Owners either have or have not identified proximate Transmission station(s) and Transmission substation(s), irrespective of ownership, within 1500 feet or 457 meters (the shortest distance, measured substation fence line to substation fence line) of an applicable Transmission station or Transmission substation identified in Requirement R1.

VSL Justifications for CIP-014-4, Requirement R2	
Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	
FERC VSL G3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	The proposed VSLs use the same terminology as used in the associated requirement and are, therefore, consistent with the requirement.
FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	Each VSL is based on a single violation and not cumulative violations.

VRF Justifications for CIP-014-4, Requirement R3	
Proposed VRF	**High**
NERC VRF Discussion	A VRF of higher is appropriate because the requirement, if violated, could directly cause or contribute to Bulk Electric System instability, separation, or a cascading sequence of failures, or could place the Bulk Electric System at an unacceptable risk of instability, separation, or cascading failures.
FERC VRF G1 Discussion Guideline 1- Consistency with	This VRF is consistent with the identified areas from the FERC list of critical areas in the Final Blackout Report.

VRF Justifications for CIP-014-4, Requirement R3	
Proposed VRF	**High**
Blackout Report	
FERC VRF G2 Discussion Guideline 2- Consistency within a Reliability Standard	The VRF for Requirement R3 is consistent with those connections between the sub-Requirement VRF assignments and the main Requirement VRF assignment.
FERC VRF G3 Discussion Guideline 3- Consistency among Reliability Standards	This VRF is consistent with other VRFs that address similar reliability goals in different Reliability Standards.
FERC VRF G4 Discussion Guideline 4- Consistency with NERC Definitions of VRFs	This VRF is consistent with the definition of a High VRF requirement per the criteria filed with FERC as part of the ERO's Sanctions Guidelines.
FERC VRF G5 Discussion Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation	This requirement does mingle a higher risk reliability objective and risk reliability objective. Therefore, the VRF reflects the risk of the whole requirement.

VSLs for CIP-014-4, Requirement R3			
Lower	**Moderate**	**High**	**Severe**
~~The Transmission Owner has a risk assessment methodology that failed to include one of the requirements listed in Parts 3.1 through 3.4.~~N/A	The Transmission Owner has a risk assessment methodology that failed to include ~~two~~one of the requirements listed in Parts 3.1 through ~~3.4~~3.3.	The Transmission Owner has a risk assessment methodology that failed to include ~~three~~two of the requirements listed in Parts 3.1 through ~~3.4~~3.3.	The Transmission Owner has a risk assessment methodology that failed to include ~~four~~all three of the requirements listed in Parts 3.1 through ~~3.4~~3.3. OR The Transmission Owner does not

			have a risk assessment methodology.

VSL Justifications for CIP-014-4, Requirement R3	
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	The proposed VSLs do not have the unintended consequence of lowering the level of compliance.
FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	The proposed VSLs are not binary and do not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.
FERC VSL G3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	The proposed VSLs use the same terminology as used in the associated requirement and are, therefore, consistent with the requirement.
FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single	Each VSL is based on a single violation and not cumulative violations.

VSL Justifications for CIP-014-4, Requirement R3	
Violation, Not on A Cumulative Number of Violations	

VRF Justifications for CIP-014-4, Requirement R4	
Proposed VRF	**Medium**
NERC VRF Discussion	A VRF of Medium is appropriate because, if violated, it could directly affect the electrical state or the capability of the Bulk Electric System, or the ability to effectively monitor and control the Bulk Electric System; however, a violation is unlikely to lead to Bulk Electric System instability, separation, or cascading failures.
FERC VRF G1 Discussion Guideline 1- Consistency with Blackout Report	This VRF is consistent with the identified areas from the FERC list of critical areas in the Final Blackout Report.
FERC VRF G2 Discussion Guideline 2- Consistency within a Reliability Standard	The VRF for Requirement R4 is consistent with those connections between the sub-Requirement VRF assignments and the main Requirement VRF assignment.
FERC VRF G3 Discussion Guideline 3- Consistency among Reliability Standards	This VRF is consistent with other VRFs that address similar reliability goals in different Reliability Standards.
FERC VRF G4 Discussion Guideline 4- Consistency with NERC Definitions of VRFs	This VRF is consistent with the definition of a Medium VRF requirement per the criteria filed with FERC as part of the ERO's Sanctions Guidelines.
FERC VRF G5 Discussion Guideline 5- Treatment of Requirements that Co-mingle More	This requirement does not mingle a higher risk reliability objective and a lesser risk reliability objective. Therefore, the VRF reflects the risk of the whole requirement.

VSL Justifications for CIP-014-4, Requirement R4	
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	The proposed VSLs do not have the unintended consequence of lowering the level of compliance.
FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	The proposed VSLs are not binary and do not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.
FERC VSL G3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	The proposed VSLs use the same terminology as used in the associated requirement and are, therefore, consistent with the requirement.
FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	Each VSL is based on a single violation and not cumulative violations.

VRF Justifications for CIP-014-4, Requirement R5	
Proposed VRF	**High**
NERC VRF Discussion	The VRF for this new Requirement R5 remains High because it is one of the two sub-Requirements of Requirement R1 from the previously FERC approved CIP-014-3 Reliability Standard.
FERC VRF G1 Discussion Guideline 1- Consistency with Blackout Report	This VRF is consistent with the identified areas from the FERC list of critical areas in the Final Blackout Report.
FERC VRF G2 Discussion Guideline 2- Consistency within a Reliability Standard	The VRF for Requirement R5 is consistent with those connections between the sub-Requirement VRF assignments and the main Requirement VRF assignment.
FERC VRF G3 Discussion Guideline 3- Consistency among Reliability Standards	This VRF is consistent with other VRFs that address similar reliability goals in different Reliability Standards.
FERC VRF G4 Discussion Guideline 4- Consistency with NERC Definitions of VRFs	This VRF is consistent with the definition of a High VRF requirement per the criteria filed with FERC as part of the ERO's Sanctions Guidelines.
FERC VRF G5 Discussion Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation	This requirement does mingle a higher risk reliability objective and risk reliability objective. Therefore, the VRF reflects the risk of the whole requirement.

VSLs for CIP-014-4, Requirement R5			
Lower	**Moderate**	**High**	**Severe**

The Transmission Owner performed a risk assessment, but did so after 36 calendar months, but less than or equal to 38 calendar months. ~~OR~~ ~~The Transmission Owner performed a risk assessment inconsistent with one of the methodology requirements listed in Requirement R3, Parts 3.1 through 3.4.~~	The Transmission Owner performed a risk assessment, but did so after 38 calendar months, but less than or equal to 40 calendar months. OR The Transmission Owner performed a risk assessment inconsistent with ~~two~~one of the methodology requirements listed in Requirement R3, Parts 3.1 through ~~3.4~~3.3.	The Transmission Owner performed a risk assessment, but did so after 40 calendar months, but less than or equal to 42 calendar months. OR The Transmission Owner performed a risk assessment but failed to include the primary control center identified in Part 5.2.	The Transmission Owner performed a risk assessment, but did so after more than 42 calendar months. OR The Transmission Owner performed a risk assessment inconsistent with ~~four~~all three of the methodology requirements listed in Requirement R3, Parts 3.1 through ~~3.4~~3.3.

VSL Justifications for CIP-014-4, Requirement R5	
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	The proposed VSLs do not have the unintended consequence of lowering the level of compliance.
FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties	The proposed VSLs are not binary and do not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.

VSL Justifications for CIP-014-4, Requirement R5	
Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	
FERC VSL G3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	The proposed VSLs use the same terminology as used in the associated requirement and are, therefore, consistent with the requirement.
FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	Each VSL is based on a single violation and not cumulative violations.

VRF Justification for CIP-014-4, Requirement R6

This Requirement is the same as Requirement R2 in CIP-014-3. The VRF did not change from the previously FERC approved CIP-014-3 Reliability Standard.

VSL Justification for CIP-014-4, Requirement R6

The Requirement is the same as Requirement R2 in the previously FERC approved CIP-014-3 Reliability Standard. The VSL did not have material changes except for the reference Requirement numbers because 5 (five) new Requirements were added.

VRF Justification for CIP-014-4, Requirement R7

This Requirement is the same as Requirement R3 in CIP-014-3. The VRF did not change from the previously FERC approved CIP-014-3 Reliability Standard.

VSL Justification for CIP-014-4, Requirement R7

The Requirement is the same as Requirement R3 in the previously FERC approved CIP-014-3 Reliability Standard. The VSL did not have material changes except for the reference Requirement numbers because 5 (five) new Requirements were added.

VRF Justification for CIP-014-4, Requirement R8

This Requirement is the same as Requirement R4 in CIP-014-3. The VRF did not change from the previously FERC approved CIP-014-3 Reliability Standard.

VSL Justification for CIP-014-4, Requirement R8

The Requirement is the same as Requirement R4 in CIP-014-3. The VSL did not have material changes from the previously FERC approved CIP-014-3 Reliability Standard except changed "Responsible Entity" to "responsible entity" and the reference Requirement numbers because 5 (five) new Requirements were added.

VRF Justification for CIP-014-4, Requirement R9

This Requirement is the same as Requirement R5 in CIP-014-3. The VRF did not change from the previously FERC approved CIP-014-3 Reliability Standard.

VSL Justification for CIP-014-4, Requirement R9

The Requirement is the same as Requirement R5 in CIP-014-3. The VSL did not have material change from the previously FERC approved CIP-014-3 Reliability Standard except changed "Responsible Entity" to "responsible entity" and the reference Requirement numbers because 5 (five) new Requirements were added.

VRF Justification for CIP-014-4, Requirement R10

This Requirement is the same as Requirement R6 in CIP-014-3. The VRF did not change from the previously FERC approved CIP-014-3 Reliability Standard.

VSL Justification for CIP-014-4, Requirement R10

NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

Technical Rationale

Project 2023-06 CIP-014 Risk Assessment Refinement
Reliability Standard CIP-014-4 | March 2026

CIP-014-4 – Physical Security

In performing the risk assessment, the Transmission Owner (TO) should first identify their population of Transmission stations and Transmission substations that meet the criteria contained in Attachment 1. The Standard requires the TO to perform a risk assessment, consisting of transmission analyses to determine which of those Transmission stations and Transmission substations, if rendered inoperable or damaged, could result in instability, uncontrolled separation, or Cascading within an Interconnection.

The purpose of Reliability Standard CIP-014 is to protect Transmission stations and Transmission substations, and their associated primary control centers, that if rendered inoperable or damaged, due to a physical attack, could cause instability, uncontrolled separation, or Cascading within an Interconnection. To properly identify candidates for such Transmission station(s) and Transmission substation(s), the TO shall evaluate the criteria listed in Attachment 1.

Rationale for Requirement R1

The Standard Authorization Request (SAR) directed the drafting team (DT) to clarify the in-service window. It also directed the DT to correct any discrepancies between the study period, frequency of study, and the base case(s) a TO uses. In the previous version of CIP-014, the 30-month time frame and the 24-month planned-to-be-in-service date could, if not carefully applied, lead to gaps between models and study horizons. Per the SAR, CIP-014-4 has consolidated these multiple timelines into one.

Requirement R1 is revised to ensure that each TO establishes a list of applicable Transmission station(s) or Transmission substation(s) in accordance with Attachment 1. Aligning the 36 calendar months look ahead in Requirement R1 with the 36 calendar months risk assessment cycle ensures that system topology of the cases used to assess applicability is consistent with the system topology in the risk assessment models.

TOs shall review and, if necessary, update the list of applicable Transmission station(s) or Transmission substation(s) per Attachment 1 at least once every 36 calendar months. The list of applicable Transmission station(s) or Transmission substation(s) shall include existing Facilities and Transmission station(s) and Transmission substation(s) planned to be in service within 36 calendar months. The 36 calendar months risk assessment study cycle aligns with the 36 calendar months planned-to-be-in-service date. "Planned to be in-service" should be taken to mean all Transmission station(s) and Transmission substation(s) as modeled in the base cases for the Near-Term Transmission Planning Horizon.

Rationale for Requirement R2

The distance chosen in requirement R2 is based on guidelines that considered a variety of plausible attack scenarios capable of rendering a substation inoperable.

The DT chose 1,500 feet or 457 meters (the shortest distance, measured substation fence line to substation fence line) in Requirement R2 after review of the Department of Homeland Security (DHS)-Department of Justice (DOJ) Bomb Threat Stand-Off Card. The Bomb Threat Stand-Off Card is a quick reference guide providing recommended evacuation and shelter-in-place distances for various types and sizes of Improvised Explosive Devices (IED), based on version of August, 2025.[1]

The guidance above allowed the DT to draft language that clarified what study scenario(s) and other study assumptions are appropriate and reasonable considering the intent of CIP-014 and the potential range of issues during a physical attack. Simulations should incorporate the loss of station elements without the reliance on local system protection. Clarifying how to account for adjacent Transmission stations or Transmission substations of differing ownership as well as for those Transmission stations or Transmission substations within line-of-sight to each other. These provide limits to what the TO must study and avoid including an explicit representation of the physical event in the standard.

Accurate simulation of the event was deemed a priority of the DT. The DT felt that ownership of proximate substations, as identified in Requirement R2, was irrelevant to Bulk Electric System impact.

The Transmission station(s) or Transmission substation(s) identified in Requirement R2 are only intended for use in the Requirement R5 risk assessment and the Requirement R6 third-party verification to properly account for additional equipment that, if also damaged during an event, could lead to loss of additional Facilities. They are not intended to be subject to Requirements R7 through R10. Requirements R7 through R10 are only relevant for the Transmission substation(s) or Transmission substation(s) identified in Requirement R1.

Rationale for Requirement R3

The new Requirement R3 fulfills the first item in the SAR to "clarify the risk assessment methods" and that the "methods should account for dynamic studies." Requirement R3 also fulfills other items in the SAR around case selection, technically supported rationales, the loss of communications, and local protection within the affected station. The previous Requirement R3 is now Requirement R7 of CIP-014-4.

Per Requirement R3, each TO is required to have a risk assessment methodology, including the criteria by which analytical results will be examined to identify Transmission station(s) or Transmission substation(s) that if rendered inoperable or damaged as a result of a physical attack could result in instability, uncontrolled separation, or Cascading within an Interconnection. The TO is not required to develop its own methodology and is free to use a methodology developed elsewhere, such as in coordination with neighboring TOs or Independent System Operators (ISOs).

Rationale for Requirement R3, Part 3.1

TOs should determine the amount of unacceptable load loss and generation loss within an Interconnection when determining the impact of an event to the Transmission system. The thresholds

[1] https://www.cisa.gov/resources-tools/resources/dhs-doj-bomb-threat-stand-card

identifying unacceptable generation and load losses should be the total of the losses within the TO's footprint and losses external to the TO's footprint. Criteria for measures such as load loss or generation loss should consider the impact to the Interconnection.

While the use of Recommended Interconnection Resource Loss Protection Criteria (RLPC) provides one approach to generation loss—setting these thresholds based on the two largest potential resource losses in an Interconnection as detailed in Attachment A of NERC Reliability Standard BAL-003-2—other methods may also be appropriate, as determined by the TO. The RLPC values should be taken from the latest approved version of NERC's annual 'Frequency Response Annual Analysis' report.

Use of the RLPC recommendations in accordance with the latest version of NERC's 'Frequency Response Annual Analysis' report is an example of technically justified thresholds for unacceptable generation and load loss within an Interconnection. Use of lower values than the RLPC recommendations is also technically justifiable. Use of higher values than the RLPC recommendations would require additional technical justification.

Large loss of generation or load due to the evaluated disturbance could result in severe System impacts. The documented risk assessment methodology shall include the amount of unacceptable load loss and generation loss, that could result in instability, uncontrolled separation, or Cascading within an Interconnection. Conditions and thresholds used for determining critical Transmission station(s) or Transmission substation(s), i.e., those that if rendered inoperable or damaged as a result of a physical attack could result in instability, uncontrolled separation, or Cascading within an Interconnection, should be part of the documented risk assessment methodology.

It is up to the TO to identify post-event measures that can be used to assess the criticality of a Transmission station or Transmission substation. Suggested measures are listed below. A TO can decide that one or more of the items are not applicable to their location within the interconnection and if any additional items should be included.

The following parameters can be used to evaluate the steady-state and/or dynamic analysis:

- Steady state voltages
- Transient voltage response
- Thermal loading of Facilities
- Relay loadability
- Rotor angle stability
- Frequency exceeding generator limits
- Frequency stability
- Acceptable damping of oscillations
- Cascading line tripping

- Steady-state voltage stability

Rationale for Requirement R3, Part 3.2
The performance of both steady state and dynamics simulations is required for all applicable Transmission station(s) and substation(s). Dynamic simulations are required by the standard because exclusively performing steady-state simulations is insufficient for determining whether the loss of a Transmission station or Transmission substation could result in instability, uncontrolled separation, or Cascading within an Interconnection.

Rationale for Requirement R3, Part 3.3
Historically, simulation of a three-phase Fault at applicable Transmission station(s) and Transmission substation(s) appears to be the prevalent assumption used by the majority of TOs in the performance of stability analyses for CIP-014 risk assessments. The DT has determined, however, that there may be specific locations or scenarios that merit the use of a different Fault type (or a sequence or progression of multiple Faults) more consistent with the occurrence of a physical attack for those locations or scenarios.

Rationale for Requirement R3, Part 3.3.1
The applicable Transmission substation or Transmission station is the station that is assumed to be under attack for the purposes of this standard. Any damage to Transmission Stations or Transmission Substations in proximity is assumed to be collateral damage. The intent of CIP-014 is to cover the case when the applicable Transmission Station or Transmission Substation becomes inoperable. The SAR refers to the "total loss of communication and protection equipment at the substation." Requirement R3, Part 3.3.1 uses the "prior loss" wording to eliminate difficulties when performing simulations. When exploring possible attack scenarios, it is possible to develop scenarios that allow a fault prior to the loss of communication and protection systems. Protection systems typically operate within a few cycles, so a short delay between the fault and the loss of the protection system could allow breakers to operate. "Prior loss of communication and Protection Systems" eliminates this possibility, so the fault should be studied without the availability of local communications or Protection Systems. The use of delayed clearing times, typically Zone 2, is necessary because the applicable substation has lost local protection and all communications with other substations.

Rationale for Requirement R3, Part 3.3.2
The relative locations of the applicable Transmission Station or Transmission Substation and the neighboring substation will determine the best way to evaluate and study the combinations of substations. Every substation identified in Requirement R2 must be studied in at least one combination with its applicable Transmission Station or Transmission Substation. For example, if there is a single neighboring substation near the applicable substation, then the applicable and neighboring substation should be studied together. If there are two or more neighboring substations that are close together and both within 1,500 feet of the applicable substation, then the responsible entity may study the applicable substation with the combination of the two neighbors. If there are two or more neighboring substations on different sides of the applicable substation, then it can make more sense to study the applicable substation with each proximity substation individually. For purposes of the simulations, the faults should be applied at the same time or after the faults applied to the applicable Transmission Station or

Transmission Substation depending on the simulated event and any restrictions of the simulation software. Not all software packages allow for multiple simultaneous faults. The protection and communication systems at the proximate substations are expected to operate normally, so delayed clearing is not necessary.

Rationale for Requirement R3, Part 3.3.3
The DT believes that requiring documented justification for Faults being selected, without specifying Fault type, allows TOs to determine on a location-by-location basis what is a credible high-severity scenario for a physical attack and furthermore how to appropriately model the associated stability simulations. The DT also believes that a single justification may be used for multiple locations. Requirement 3 Part 3.3.3 allows the TOs to determine the type of fault with documented justification. If a fault type and justification is relevant to multiple Transmission Stations or Transmission Substations, there is no need to repeatedly document the same justification.

Rationale for Requirement R3, Part 3.3.4
Each simulation should include the removal of all Elements that Protection Systems and other controls are expected to automatically disconnect for the event. After the prior loss of communication and Protection Systems at the applicable Transmission station or Transmission substation, other Protection Systems should operate as expected for the event considered. The accurate simulation of Protection System actions is essential for correctly identifying the risk of instability, uncontrolled separation, or Cascading within an Interconnection.

Rationale for Requirement R3, Part 3.3.5
While there are commonly used generic clearing times for remote clearing that are consistent across the industry, actual clearing times can be shorter or longer depending on conditions and design considerations at an individual TO. The difference of a few cycles can have a significant impact on the transient behavior of generating units, therefore, it is required that the risk analysis use actual or more conservative clearing times.

Rationale for Requirement R4
Joint ownership of Transmission substations and Transmission stations was discussed in the Guidelines and Technical Basis of previous versions of the CIP-014-3 standard, but because ownership was not addressed in the standard language, the CIP-014-4 Risk Assessment Refinement SAR required clarification which resulted in the new requirement R4. TOs that have applicable jointly owned Transmission substations and Transmission stations should coordinate and document their individual and joint responsibilities for CIP-014-4 Requirements R3 and R5. TOs should be able to demonstrate sole or joint ownership through one-line diagrams with ownership demarcations and/or a letter of attestation stating which stations are solely or jointly owned.

Rationale for Requirement R5
An objective of the CIP-014-3 Risk Assessment Refinement SAR was to align study periods, frequency of studies, and the powerflow models used for the studies. A 36-month periodicity was chosen for the Requirement R5 risk assessment to reduce the periodicity options from previous versions of the standard.

Additionally, a single study periodicity is more easily aligned with project in-service date considerations and model choices. As called for in Project Scope item 3 of the CIP-014-3 Risk Assessment Refinement SAR, the risk assessment must comply with the methodology developed in Requirement R3, so this language was explicitly added to Requirement R5.

TOs shall review and, if necessary, update the list of applicable Transmission station(s) or Transmission substation(s) per Attachment 1 at least once every 36 months. The list of applicable Transmission station(s) and Transmission substation(s) shall include existing or planned to be in service within 36 months Transmission station(s) and Transmission substation(s). The 36-month cycle for updating the list of applicable Transmission station(s) or Transmission substation(s) per Attachment 1 aligns with the annual cycle for performing Planning Assessments per NERC Standard TPL-001. The 36-month risk assessment study cycle aligns with the 36-month planned-to-be-in-service date.

In addition to the performance of the risk assessment using Transmission station(s) and Transmission substation(s) identified in Requirement R1, any proximate Transmission station(s) and Transmission substation(s) identified in Requirement R2 should also be included in the risk assessment. Furthermore, any Transmission station(s) and Transmission substation(s) assessed due to having been identified per Requirement R1 should also be run as part of a proximate Transmission station(s) and Transmission substation(s) group per Requirement R2 if such an identification is made.

Rationale for Requirement R5, Part 5.1
If a TO performs a steady state analysis and identifies a Transmission station or substation that, if rendered inoperable or damaged, could result in instability, uncontrolled separation, or Cascading within an Interconnection, then dynamic analysis is not required for that Transmission station or substation. If a TO performs a dynamic analysis and identifies a Transmission station or substation that, if rendered inoperable or damaged, could result in instability, uncontrolled separation, or Cascading within an Interconnection, then steady state analysis is not required for that Transmission station or substation.

Rationale for Requirement R5, Part 5.2
The intent of this Requirement is that TOs do not have to reassess already identified and protected Transmission stations or substations (Requirement R5.3 and Requirements R7 through R10 still apply to those Transmission stations or substations). A new risk assessment will need to be performed if the TO wishes to determine whether or not a Transmission station or substation can be removed from identification and protection as outlined in Requirement R7.1.

Rationale for Requirement R5, Part 5.3
Identification of Primary Control Centers: After completing the risk assessment under Requirement R5 and verified under Requirement R6, it is important to additionally identify the primary control center that operationally controls each Transmission station or Transmission substation, that if rendered inoperable or damaged could result in instability, uncontrolled separation, or Cascading within an Interconnection. A primary control center “operationally controls” a Transmission station or Transmission substation when the control center’s electronic actions can cause direct physical actions at the identified Transmission station and Transmission substation, such as opening a breaker.

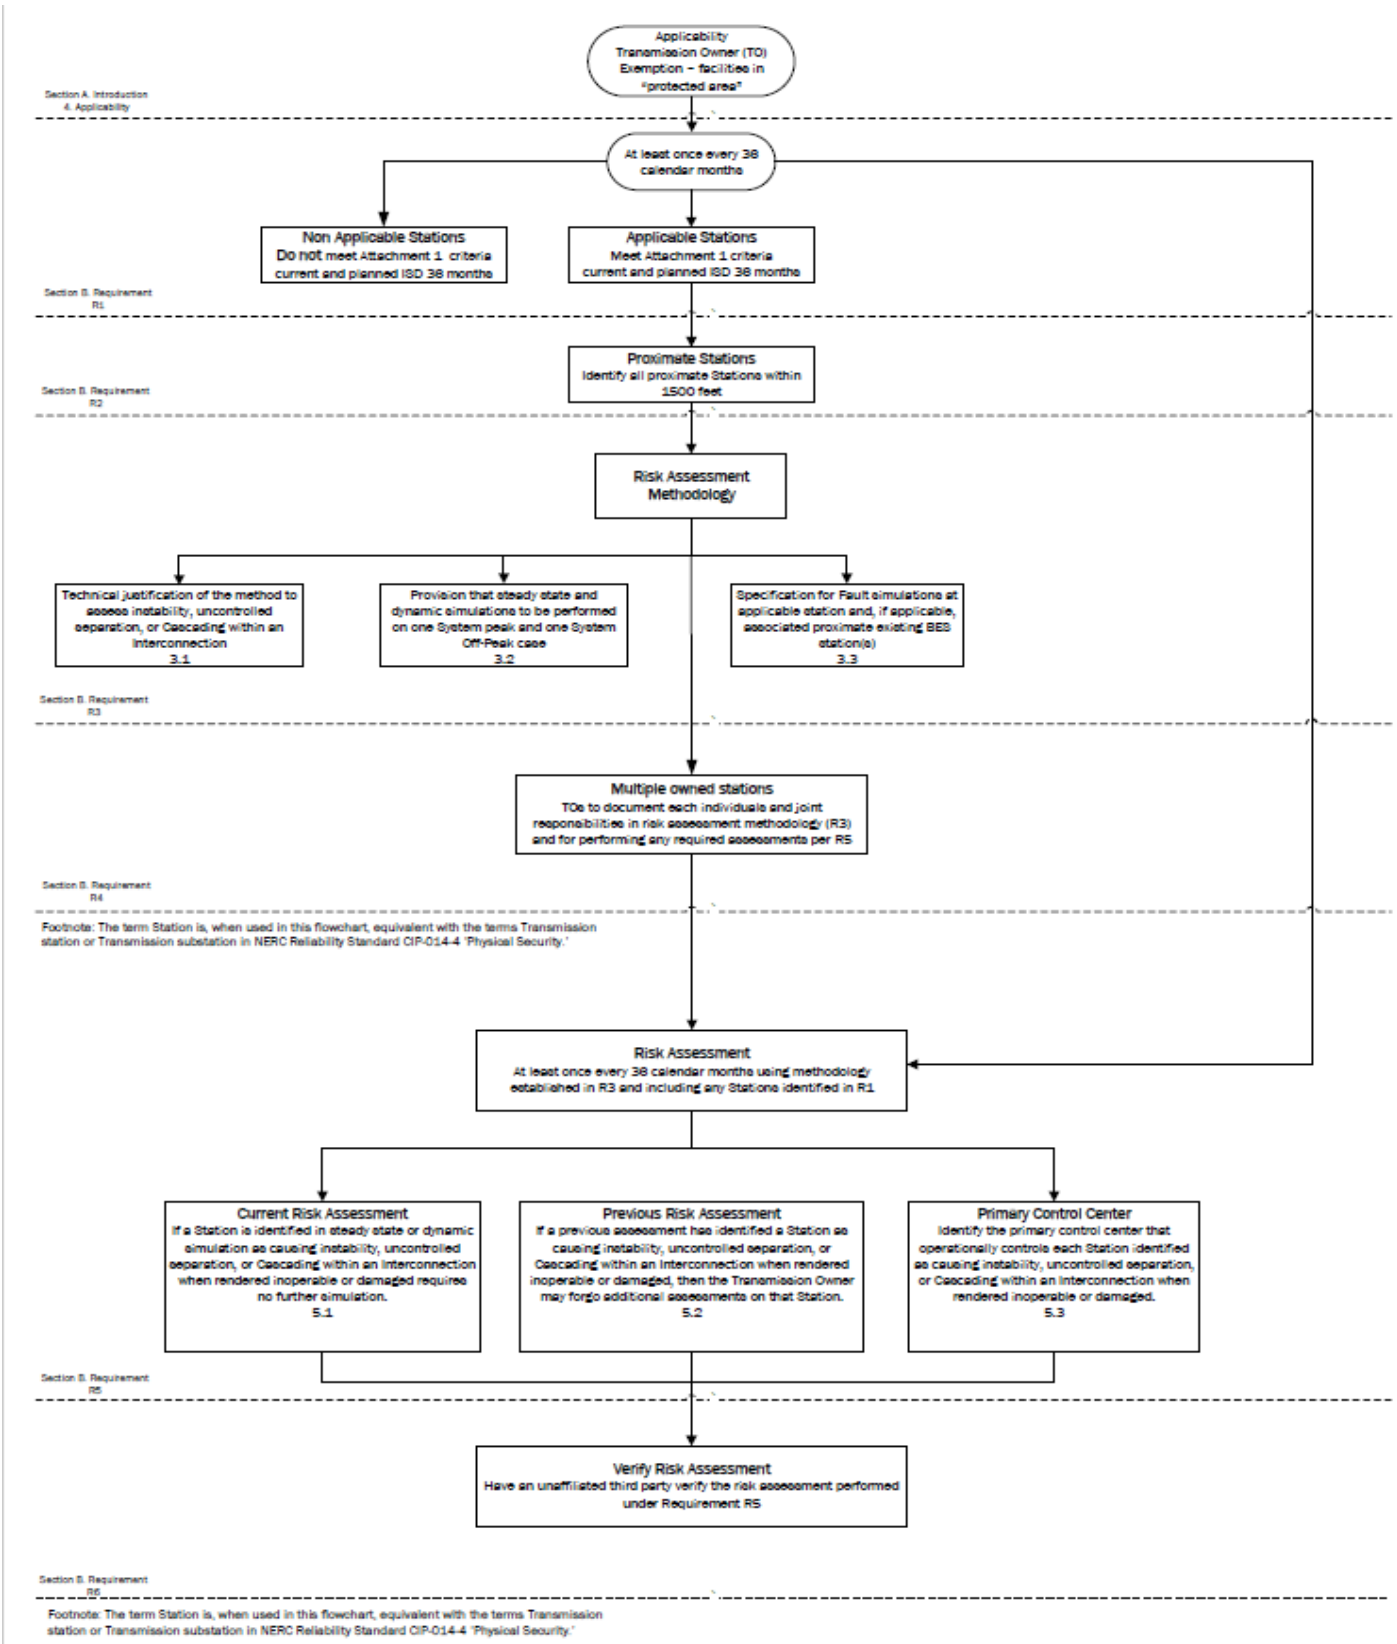
Rationale for Implementation Plan

In developing the Implementation Plan, the DT has determined that 24 calendar months for the CIP-014-4 implementation plan would allow adequate time for TOs and Transmission Operators (TOPs) to determine applicability, develop criteria, write or revise methodologies, perform assessments, and procure unaffiliated third parties for risk assessment verification (which some TOs have performed concurrently with their risk assessment analyses.

Furthermore, given a) FERC's sense of urgency stated in their original Order to revise CIP-014 (Docket No. RD23-2-000, issued December 15, 2022), b) the findings of NERC's report to FERC on April 14, 2023 (Evaluation of the Physical Security Reliability Standard and Physical Security Attacks to the Bulk-Power System), and c) the designation of Project 2023-06 as High Priority, the DT has determined that an Implementation Plan schedule of greater than 24 calendar months would not be responsive to FERC's concerns with sufficient urgency, and thus 24 calendar months is an appropriate timeframe. While the DT understands the time and resources required of entities to respond to this Implementation Plan, the DT believes that 24 calendar months properly balances the need to address the reliability risk and the time needed by entities to determine applicability, develop criteria, write or revise methodologies, perform assessments, and procure unaffiliated third parties for risk assessment verification.

CIP-014-4 Flowchart

The flowchart is a concise outline that guides through the steps for completing the risk assessment at least once every 36 calendar months, based on the Applicability in Attachment 1 and Requirements R1-R5.



Applicability
Transmission Owner (TO) Exemption – facilities in "protected area"
Section A. Introduction 4. Applicability
At least once every 36 calendar months
Non Applicable Stations
Do not meet Attachment 1 criteria current and planned ISD 36 months
Applicable Stations
Meet Attachment 1 criteria current and planned ISD 36 months
Section B. Requirement R1
Proximate Stations
Identify all proximate Stations within 1500 feet
Section B. Requirement R2
Risk Assessment Methodology
Technical justification of the method to assess instability, uncontrolled separation, or Cascading within an Interconnection 3.1
Provision that steady state and dynamic simulations to be performed on one System peak and one System Off-Peak case 3.2
Specification for Fault simulations at applicable station and, if applicable, associated proximate existing BES station(s) 3.3
Section B. Requirement R3
Multiple owned stations
TOs to document each individuals and joint responsibilities in risk assessment methodology (R3) and for performing any required assessments per R5
Section B. Requirement R4
Footnote: The term Station is, when used in this flowchart, equivalent with the terms Transmission station or Transmission substation in NERC Reliability Standard CIP-014-4 'Physical Security.'
Risk Assessment
At least once every 36 calendar months using methodology established in R3 and including any Stations identified in R1
Current Risk Assessment
If a Station is identified in steady state or dynamic simulation as causing instability, uncontrolled separation, or Cascading within an Interconnection when rendered inoperable or damaged requires no further simulation. 5.1
Previous Risk Assessment
If a previous assessment has identified a Station as causing instability, uncontrolled separation, or Cascading within an Interconnection when rendered inoperable or damaged, then the Transmission Owner may forgo additional assessments on that Station. 5.2
Primary Control Center
Identify the primary control center that operationally controls each Station identified as causing instability, uncontrolled separation, or Cascading within an Interconnection when rendered inoperable or damaged. 5.3
Section B. Requirement R5
Verify Risk Assessment
Have an unaffiliated third party verify the risk assessment performed under Requirement R5
Section B. Requirement R6
Footnote: The term Station is, when used in this flowchart, equivalent with the terms Transmission station or Transmission substation in NERC Reliability Standard CIP-014-4 'Physical Security.'

Technical Rationale for Reliability Standard CIP-014-3

This section contains a "cut and paste" of the former Guidelines and Technical Basis (GTB) as-is of from CIP-014-3 standard to preserve any historical references. No modifications have been made.

Requirement R2 (This is Requirement R6 in CIP-014-4)
This requirement specifies verification of the risk assessment performed under Requirement R1 by an entity other than the owner or operator of the Requirement R1 risk assessment.

A verification of the risk assessment by an unaffiliated third party, as specified in Requirement R2, could consist of:

1. Certifying that the Requirement R1 risk assessment considers the Transmission stations and Transmission substations identified in Applicability Section 4.1.1.
2. Review of the model used to conduct the risk assessment to ensure it contains sufficient system topology to identify Transmission stations and Transmission substations that if rendered inoperable or damaged could cause instability, uncontrolled separation, or Cascading within an Interconnection.
3. Review of the Requirement R1 risk assessment methodology.

This requirement provides the flexibility for a TO to select from unaffiliated registered and non-registered entities with transmission planning or analysis experience to perform the verification of the Requirement R1 risk assessment. The term unaffiliated means that the selected verifying entity cannot be a corporate affiliate (i.e., the verifying or third party reviewer cannot be an entity that corporately controls, is controlled by, or is under common control with the TO). The verifying entity also cannot be a division of the TO that operates as a functional unit.

The prohibition on registered entities using a corporate affiliate to conduct the verification, however, does not prohibit a governmental entity (e.g., a city, a municipality, a U.S. federal power marketing agency, or any other political subdivision of U.S. or Canadian federal, state, or provincial governments) from selecting as the verifying entity another governmental entity within the same political subdivision. For instance, a U.S. federal power marketing agency may select as its verifier another U.S. federal agency to conduct its verification so long as the selected entity has transmission planning or analysis experience. Similarly, a TO owned by a Canadian province can use a separate agency of that province to perform the verification. The verifying entity, however, must still be a third party and cannot be a division of the registered entity that operates as a functional unit.

Requirement R2 also provides that the "verification may occur concurrent with or after the risk assessment performed under Requirement R1." This provision is designed to provide the TO the flexibility to work with the verifying entity throughout (i.e., concurrent with) the risk assessment, which for some TOs may be more efficient and effective. In other words, a TO could collaborate with their unaffiliated verifying entity to perform the risk assessment under Requirement R1 such that both Requirement R1 and

Requirement R2 are satisfied concurrently. The intent of Requirement R2 is to have an entity other than the owner or operator of the facility to be involved in the risk assessment process and have an opportunity to provide input. Accordingly, Requirement R2 is designed to allow entities the discretion to have a two-step process, where the TO performs the risk assessment and subsequently has a third party review that assessment, or a one-step process, where the entity collaborates with a third party to perform the risk assessment.

Characteristics to consider in selecting a third party reviewer could include:

- Registered Entity with applicable planning and reliability functions.
- Experience in power system studies and planning.
- The entity's understanding of the MOD standards, TPL standards, and facility ratings as they pertain to planning studies.
- The entity's familiarity with the Interconnection within which the TO is located.

With respect to the requirement that TO develop and implement procedures for protecting confidential and sensitive information, the TO could have a method for identifying documents that require confidential treatment. One mechanism for protecting confidential or sensitive information is to prohibit removal of sensitive or confidential information from the TO's site. TOs could include such a prohibition in a non-disclosure agreement with the verifying entity.

A Technical feasibility study is not required in the Requirement R2 documentation of the technical basis for not modifying the identification in accordance with the recommendation.

On the issue of the difference between a verifier in Requirement R2 and a reviewer in Requirement R6, the DT indicates that the verifier will confirm that the risk assessment was completed in accordance with Requirement R1, including the number of Transmission stations and substations identified, while the reviewer in Requirement R6 is providing expertise on the manner in which the evaluation of threats was conducted in accordance with Requirement R4, and the physical security plan in accordance with Requirement R5. In the latter situation there is no verification of a technical analysis, rather an application of experience and expertise to provide guidance or recommendations, if needed.

Parts 2.4 and 6.4 require the entities to have procedures to protect the confidentiality of sensitive or confidential information. Those procedures may include the following elements:

1. Control and retention of information on site for third party verifiers/reviewers.
2. Only "need to know" employees, etc., get the information.
3. Marking documents as confidential
4. Securely storing and destroying information when no longer needed.
5. Not releasing information outside the entity without, for example, General Counsel sign-off.

Requirement R3 (This is now Requirement R7 in CIP-014-4)
Some TOPs will have obligations under this standard for certain primary control centers. Those obligations, however, are contingent upon a Transmission Owner(TO) first completing the risk assessment specified by Requirement R1 and the verification specified by Requirement R2. Requirement R3 is intended to ensure that a TOP that has operational control of a primary control center identified in Requirement R1 receive notice so that the TOP may fulfill the rest of the obligations required in Requirements R4 through R6. Since the timing obligations in Requirements R4 through R6 are based upon completion of Requirement R2, the TO must also include within the notice the date of completion of Requirement R2. Similarly, the TO must notify the TOP of any removals from identification that result from a subsequent risk assessment under Requirement R1 or as a result of the verification process under Requirement R2.

Requirement R4 (This is now Requirement R8 in CIP-014-4)
This requirement requires owners and operators of facilities identified by the Requirement R1 risk assessment and that are verified under Requirement R2 to conduct an assessment of potential threats and vulnerabilities to those Transmission stations, Transmission substations, and primary control centers using a tailored evaluation process. Threats and vulnerabilities may vary from facility to facility based on any number of factors that include, but are not limited to, location, size, function, existing physical security protections, and attractiveness as a target.

In order to effectively conduct a threat and vulnerability assessment, the asset owner may be the best source to determine specific site vulnerabilities, but current and evolving threats may best be determined by others in the intelligence or law enforcement communities. A number of resources have been identified in the standard, but many others exist and asset owners are not limited to where they may turn for assistance. Additional resources may include state or local fusion centers, U.S. Department of Homeland Security, Federal Bureau of Investigations (FBI), Public Safety Canada, Royal Canadian Mounted Police, and InfraGard chapters coordinated by the FBI.

The Responsible Entity is required to take a number of factors into account in Parts 4.1 to 4.3 in order to make a risk-based evaluation under Requirement R4.

To assist in determining the current threat for a facility, the prior history of attacks on similarly protected facilities should be considered when assessing probability and likelihood of occurrence at the facility in question.

Resources that may be useful in conducting threat and vulnerability assessments include:

- NERC Security Guideline for the Electricity Sector: Physical Security.
- NERC Security Guideline: Physical Security Response.
- ASIS International General Risk Assessment Guidelines.
- ASIS International Facilities Physical Security Measure Guideline.
- ASIS International Security Management Standard: Physical Asset Protection.

- Whole Building Design Guide - Threat/Vulnerability Assessments.

Requirement R5 (This is now Requirement R9 in CIP-014-4)
This requirement specifies development and implementation of a security plan(s) designed to protect against attacks to the facilities identified in Requirement R1 based on the assessment performed under Requirement R4.

Requirement R5 specifies the following attributes for the physical security plan:

- *Resiliency or security measures designed collectively to deter, detect, delay, assess, communicate, and respond to potential physical threats and vulnerabilities identified during the evaluation conducted in Requirement R4.*

  Resiliency may include, among other things:

  a. System topology changes,

  b. Spare equipment,

  c. Construction of a new Transmission station or Transmission substation.

  While most security measures will work together to collectively harden the entire site, some may be allocated to protect specific critical components. For example, if protection from gunfire is considered necessary, the entity may only install ballistic protection for critical components, not the entire site.

- *Law enforcement contact and coordination information.*

  Examples of such information may be posting 9-1-1 for emergency calls and providing substation safety and familiarization training for local and federal law enforcement, fire department, and Emergency Medical Services.

- *A timeline for executing the physical security enhancements and modifications specified in the physical security plan.*

  Entities have the flexibility to prioritize the implementation of the various resiliency or security enhancements and modifications in their security plan according to risk, resources, or other factors. The requirement to include a timeline in the physical security plan for executing the actual physical security enhancements and modifications does not also require that the enhancements and modifications be completed within 120 days. The actual timeline may extend beyond the 120 days, depending on the amount of work to be completed.

- *Provisions to evaluate evolving physical threats, and their corresponding security measures, to the Transmission station(s), Transmission substation(s), or primary control center(s).*

  A registered entity's physical security plan should include processes and responsibilities for obtaining and handling alerts, intelligence, and threat warnings from various sources. Some of these sources could include the ERO, E-ISAC, and US and/or Canadian federal agencies. This information should be used to reevaluate or consider changes in the security plan and corresponding security measures of the security plan found in R5.

Incremental changes made to the physical security plan prior to the next required third party review do not require additional third party reviews.

Requirement R6 (This is now Requirement R10 in CIP-014-4)
This requirement specifies review by an entity other than the TO or TOP with appropriate expertise for the evaluation performed according to Requirement R4 and the security plan(s) developed according to Requirement R5. As with Requirement R2, the term unaffiliated means that the selected third party reviewer cannot be a corporate affiliate (*i.e.,* the third party reviewer cannot be an entity that corporately controls, is controlled by or is under common control with, the TOP). A third party reviewer also cannot be a division of the TOP that operates as a functional unit.

As noted in the guidance for Requirement R2, the prohibition on registered entities using a corporate affiliate to conduct the review, however, does not prohibit a governmental entity from selecting as the third party reviewer another governmental entity within the same political subdivision. For instance, a city or municipality may use its local enforcement agency, so long as the local law enforcement agency satisfies the criteria in Requirement R6. The third party reviewer, however, must still be a third party and cannot be a division of the registered entity that operates as a functional unit.

The Responsible Entity can select from several possible entities to perform the review:

- *An entity or organization with electric industry physical security experience and whose review staff has at least one member who holds either a Certified Protection Professional or Physical Security Professional certification.*

  In selecting Certified Protection Professional and Physical Security Professional for use in this standard, the DT believed it was important that if a private entity such as a consulting or security firm was engaged to conduct the third party review, they must tangibly demonstrate competence to conduct the review. This includes electric industry physical security experience and either of the premier security industry certifications sponsored by ASIS International. The ASIS certification program was initiated in 1977, and those that hold the Certified Protection Professional certification are board certified in security management. Those that hold the Physical Security Professional certification are board certified in physical security.
- *An entity or organization approved by the ERO.*
- *A governmental agency with physical security expertise.*
- *An entity or organization with demonstrated law enforcement, government, or military physical security expertise.*

As with the verification under Requirement R2, Requirement R6 provides that the "review may occur concurrently with or after completion of the evaluation performed under Requirement R4 and the security plan development under Requirement R5." This provision is designed to provide applicable TOs and TOPs the flexibility to work with the third party reviewer throughout (*i.e.,* concurrent with) the evaluation performed according to Requirement R4 and the security plan(s) developed according to Requirement R5, which for some Responsible Entities may be more efficient and effective. In other

words, a TO or TOP could collaborate with their unaffiliated third party reviewer to perform an evaluation of potential threats and vulnerabilities (Requirement R4) and develop a security plan (Requirement R5) to satisfy Requirements R4 through R6 simultaneously. The intent of Requirement R6 is to have an entity other than the owner or operator of the facility to be involved in the Requirement R4 evaluation and the development of the Requirement R5 security plans and have an opportunity to provide input on the evaluation and the security plan. Accordingly, Requirement R6 is designed to allow entities the discretion to have a two-step process, where the TO performs the evaluation and develops the security plan itself and then has a third party review that assessment, or a one-step process, where the entity collaborates with a third party to perform the evaluation and develop the security plan.

Rationale for Attachment 1

The drafting team moved the applicability language from CIP-014-3 to Attachment 1 to make the standard easier to read.

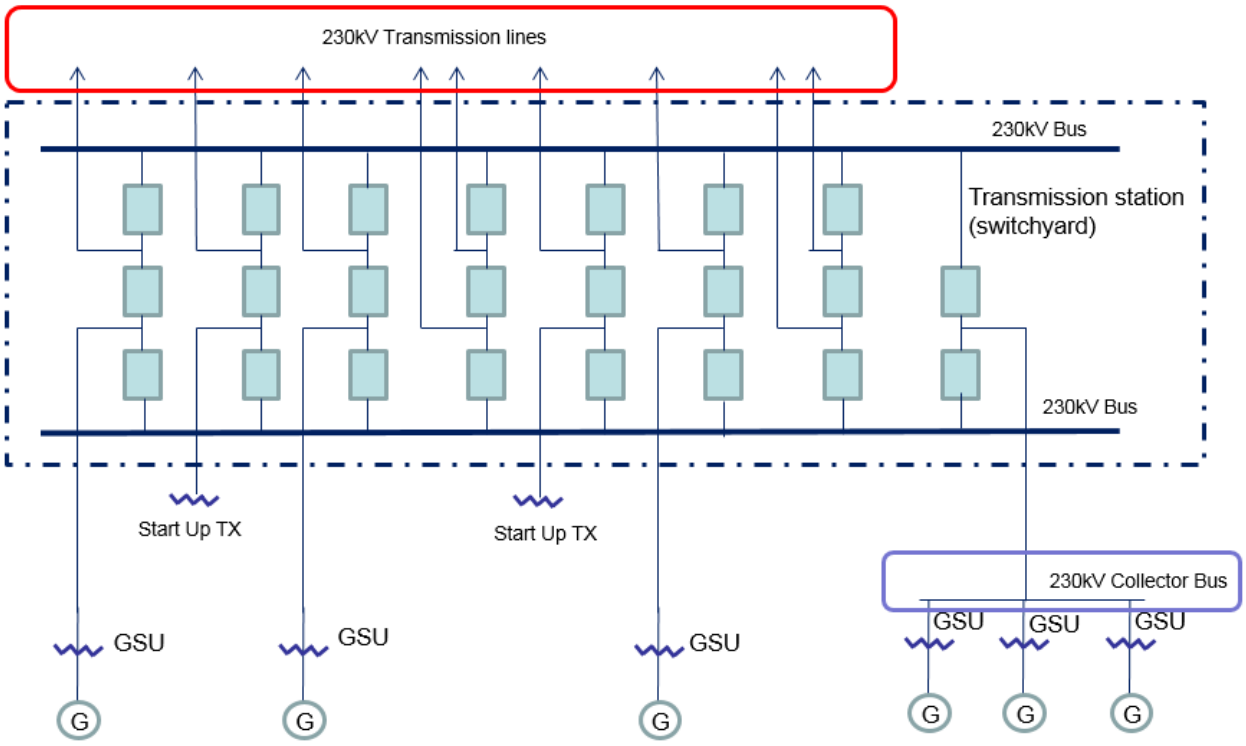
The purpose of Reliability Standard CIP-014 is to protect Transmission stations and Transmission substations, and their associated primary control centers that if rendered inoperable or damaged as a result of a physical attack could result in instability, uncontrolled separation, or Cascading within an Interconnection. To properly include those entities that own or operate such Facilities, the Reliability Standard CIP-014 first applies to TOs that own Transmission Facilities that meet the specific criteria in Applicability Section 4.1.1.1 through 4.1.1.4. The Facilities described in Applicability Section 4.1.1.1 through 4.1.1.4 mirror those Transmission Facilities that meet the bright line criteria for "Medium Impact" Transmission Facilities under Attachment 1 of Reliability Standard CIP-002-5.1. Each TO that owns Transmission Facilities that meet the criteria in Section 4.1.1.1 through 4.1.1.4 is required to perform a risk assessment as specified in Requirement R1 to identify its Transmission stations and Transmission substations, and their associated primary control centers, that if rendered inoperable or damaged as a result of a physical attack could result in instability, uncontrolled separation, or Cascading within an Interconnection. The DT expects this population will be small and that many TOs that meet the applicability of this standard will not actually identify any such Facilities. Only those TOs with Transmission stations or Transmission substations identified in the risk assessment (and verified under Requirement R2) have performance obligations under Requirements R3 through R6.

This standard also applies to TOPs. A TOP's obligations under the standard, however, are only triggered if the TOP is notified by an applicable TO under Requirement R3 that the TOP operates a primary control center that operationally controls a Transmission station(s) or Transmission substation(s) identified in the Requirement R1 risk assessment. A primary control center operationally controls a Transmission station or Transmission substation when the control center's electronic actions can cause direct physical action at the identified Transmission station or Transmission substation, such as opening a breaker, as opposed to a control center that only has information from the Transmission station or Transmission substation and must coordinate direct action through another entity. Only TOPs who are notified that they have primary control centers under this standard have performance obligations under Requirements R4 through R6. In other words, primary control center for purposes of this Standard is the control center that the TO or TOP, respectively, uses as its primary, permanently-manned site to physically operate a Transmission station or Transmission substation that is identified in Requirement R1 and verified in Requirement R2. Control

centers that provide back-up capability are not applicable, as they are a form of resiliency and intentionally redundant.

The DT considered several options for bright line criteria that could be used to determine applicability and provide an initial threshold that defines the set of Transmission stations and Transmission substations that would meet the directives of the FERC order on physical security (*i.e.*, those that could cause instability, uncontrolled separation, or Cascading within an Interconnection). The DT determined that using the criteria for Medium Impact Transmission Facilities in Attachment 1 of CIP-002-5.1 would provide a conservative threshold for defining which Transmission stations and Transmission substations must be included in the risk assessment in Requirement R1 of CIP-014. Additionally, the DT concluded that using the CIP-002-5.1 Medium Impact criteria was appropriate because it has been approved by stakeholders, NERC, and FERC, and its use provides a technically sound basis to determine which TOs should conduct the risk assessment. As described in CIP-002-5.1, the failure of a Transmission station or Transmission substation that meets the Medium Impact criteria could have the capability to result in exceeding one or more Interconnection Reliability Operating Limits (IROLs). The DT understands that using this bright line criteria to determine applicability may require some TOs to perform risk assessments under Requirement R1 that will result in a finding that none of their Transmission stations or Transmission substations would pose a risk of instability, uncontrolled separation, or Cascading within an Interconnection. However, the DT determined that higher bright lines could not be technically justified to ensure inclusion of all Transmission stations and Transmission substations, and their associated primary control centers that, if rendered inoperable or damaged as a result of a physical attack could result in instability, uncontrolled separation, or Cascading within an Interconnection. Further guidance and technical basis for the bright line criteria for Medium Impact Facilities can be found in the Guidelines and Technical Basis section of CIP-002-5.1.

Additionally, the DT determined that it was not necessary to include Generator Operators and Generator Owners in the Reliability Standard. First, Transmission stations or Transmission substations interconnecting generation facilities are considered when determining applicability. TOs will consider those Transmission stations and Transmission substations that include a Transmission station on the high side of the Generator Step-up transformer using Applicability Section 4.1.1.1 and 4.1.1.2. As an example, a Transmission station or Transmission substation identified as a TO facility that interconnects generation will be subject to the Requirement R1 risk assessment if it operates at 500kV or greater or if it is connected at 200 kV – 499kV to three or more other Transmission stations or Transmission substations and has an "aggregate weighted value" exceeding 3,000 according to the table in Applicability Section 4.1.1.2. Second, the Transmission analysis or analyses conducted under Requirement R1 should take into account the impact of the loss of generation connected to applicable Transmission stations or Transmission substations. Additionally, the FERC order does not explicitly mention generation assets and is reasonably understood to focus on the most critical Transmission Facilities. The diagram below shows an example of a station.

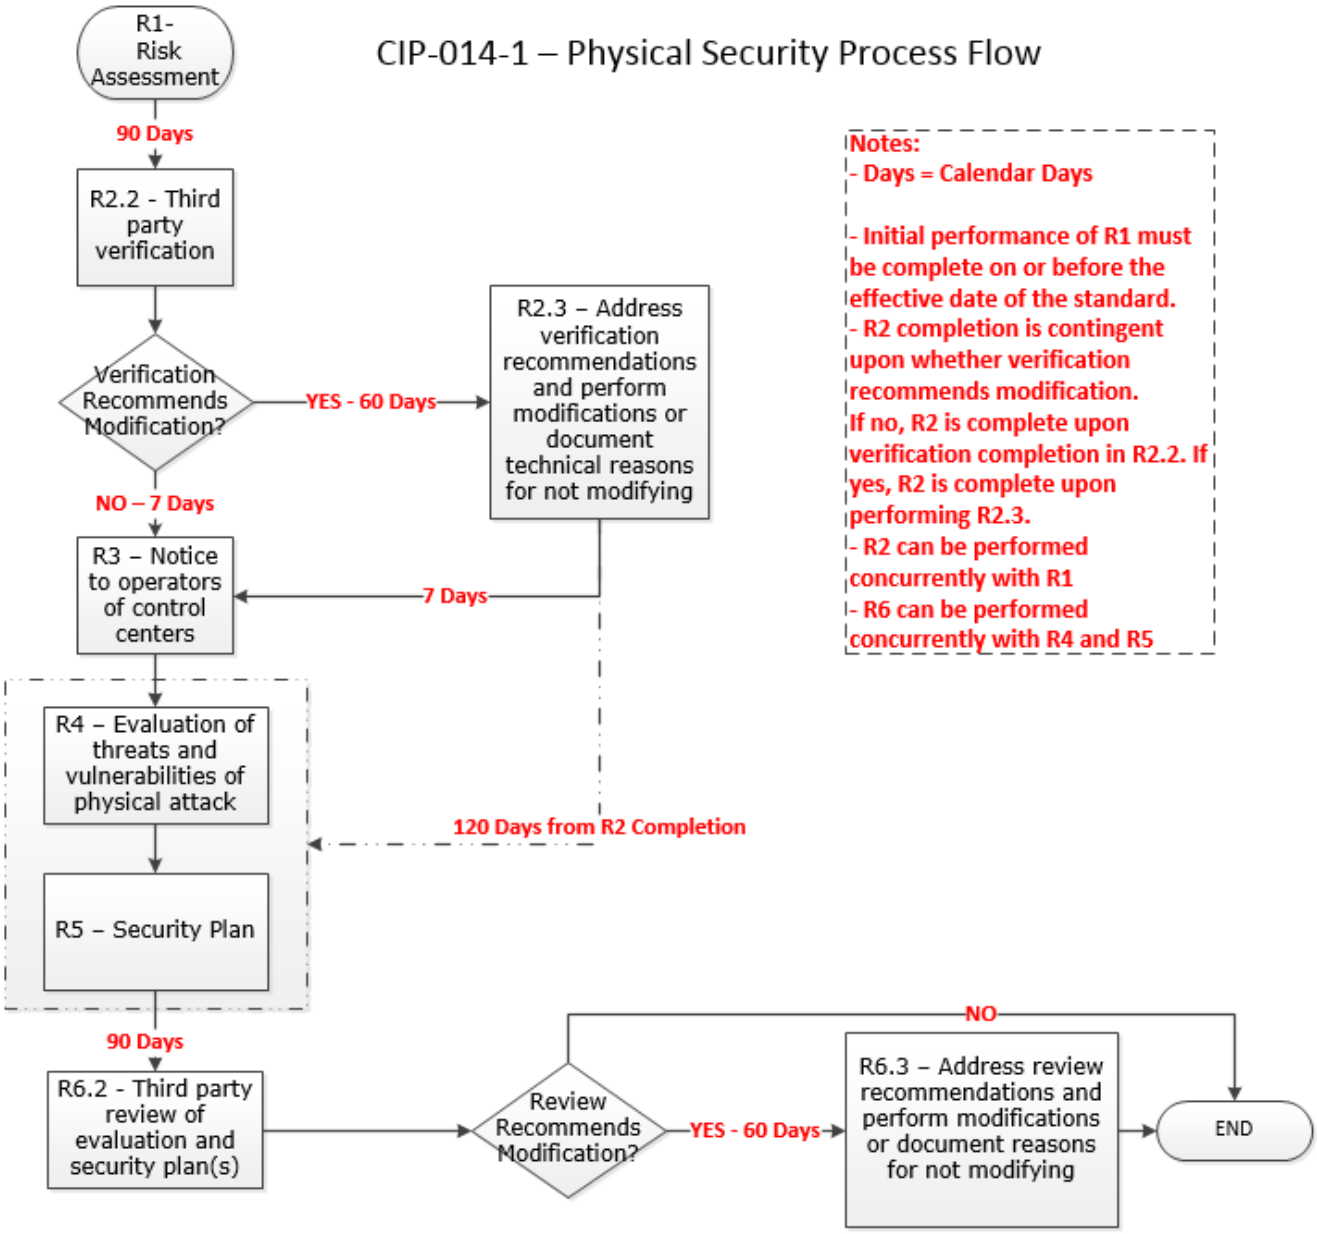


Also, the DT uses the phrase "Transmission stations or Transmission substations" to recognize the existence of both stations and substations. Many entities in industry consider a substation to be a location with physical borders (i.e., fence, wall, etc.) that contains at least an autotransformer. Locations also exist that do not contain autotransformers, and many entities in industry refer to those locations as stations (switching stations or switchyards). Therefore, the DT chose to use both "station" and "substation" to refer to the locations where groups of Transmission Facilities exist.

On the issue of joint ownership, the DT recognizes that this issue is not unique to CIP-014, and expects that the applicable TOs and TOPs will develop memorandums of understanding, agreements, Coordinated Functional Registrations, or procedures, etc., to designate responsibilities under CIP-014 when joint ownership is at issue, which is similar to what many entities have completed for other Reliability Standards.

The language contained in the applicability section regarding the collector bus is directly copied from CIP-002-5.1, Attachment 1, and has no additional meaning within the CIP-014 standard.

Timeline



CIP-014-1 – Physical Security Process Flow
R1- Risk Assessment
90 Days
R2.2 - Third party verification
Verification Recommends Modification?
YES - 60 Days
R2.3 – Address verification recommendations and perform modifications or document technical reasons for not modifying
NO – 7 Days
R3 – Notice to operators of control centers
7 Days
R4 – Evaluation of threats and vulnerabilities of physical attack
120 Days from R2 Completion
R5 – Security Plan
90 Days
R6.2 - Third party review of evaluation and security plan(s)
Review Recommends Modification?
YES - 60 Days
NO
R6.3 – Address review recommendations and perform modifications or document reasons for not modifying
END
Notes:
- Days = Calendar Days
- Initial performance of R1 must be complete on or before the effective date of the standard.
- R2 completion is contingent upon whether verification recommends modification. If no, R2 is complete upon verification completion in R2.2. If yes, R2 is complete upon performing R2.3.
- R2 can be performed concurrently with R1
- R6 can be performed concurrently with R4 and R5

Rationale

During development of this standard, text boxes were embedded within the standard to explain the rationale for various parts of the standard. Upon Board of Trustees approval, the text from the rationale text boxes was moved to this section.

Rationale for Requirement R1 (This is for the old Requirement R1 in CIP-014-3):
This requirement meets the FERC directive from paragraph 6 of its March 7, 2014 order on physical security to perform a risk assessment to identify which facilities if rendered inoperable or damaged could impact an Interconnection through instability, uncontrolled separation, or cascading failures. The requirement is not intended to bring within the scope of the standard a Transmission station or Transmission substation unless the applicable TO determines through technical studies and analyses based on objective analysis, technical expertise, operating experience and experienced judgment that the loss of such facility would have a critical impact on the operation of the Interconnection in the event the asset is rendered inoperable or damaged. In the November 20, 2014 Order, FERC reiterated that "only an instability that has a "critical impact on the operation of the interconnection" warrants finding that the facility causing the instability is critical under Requirement R1." The TO may determine the criteria for critical impact by considering, among other criteria, any of the following:

- Criteria or methodology used by Transmission Planners or Planning Coordinators in TPL-001-4, Requirement R6
- NERC EOP-004-2 reporting criteria
- Area or magnitude of potential impact

Requirement R1 also meets the FERC directive for periodic reevaluation of the risk assessment by requiring the risk assessment to be performed every 30 months (or 60 months for an entity that has not identified in a previous risk assessment any Transmission stations or Transmission substations that if rendered inoperable or damaged could result in instability, uncontrolled separation, or Cascading within an Interconnection).

After identifying each Transmission station and Transmission substation that meets the criteria in Requirement R1, it is important to additionally identify the primary control center that operationally controls that Transmission station or Transmission substation (i.e., the control center whose electronic actions can cause direct physical actions at the identified Transmission station and Transmission substation, such as opening a breaker, compared to a control center that only has the ability to monitor the Transmission station and Transmission substation and, therefore, must coordinate direct physical action through another entity).

Rationale for Requirement R2 (This is now Requirement R6 in CIP-014-4):
This requirement meets the FERC directive from paragraph 11 in the order on physical security requiring verification by an entity other than the owner or operator of the risk assessment performed under Requirement R1.

This requirement provides the flexibility for a TO to select registered and non-registered entities with transmission planning or analysis experience to perform the verification of the Requirement R1 risk assessment. The term "unaffiliated" means that the selected verifying entity cannot be a corporate affiliate (i.e., the verifying entity cannot be an entity that controls, is controlled by, or is under common control with, the TO). The verifying entity also cannot be a division of the TO that operates as a functional unit. The term "unaffiliated" is not intended to prohibit a governmental entity from using another government entity to be a verifier under Requirement R2.

Requirement R2 also provides the TO the flexibility to work with the verifying entity throughout the Requirement R1 risk assessment, which for some TO may be more efficient and effective. In other words, a TO could coordinate with their unaffiliated verifying entity to perform a Requirement R1 risk assessment to satisfy both Requirement R1 and Requirement R2 concurrently.

Planning Coordinator is a functional entity listed in Part 2.1. The Planning Coordinator and Planning Authority are the same entity as shown in the NERC Glossary of Terms Used in NERC Reliability Standards.

Rationale for Requirement R3 (This is now Requirement R7 in CIP-014-4):
Some TOPs will have obligations under this standard for certain primary control centers. Those obligations, however, are contingent upon a TO first identifying which Transmission stations and Transmission substations meet the criteria specified by Requirement R1, as verified according to Requirement R2. This requirement is intended to ensure that a TOP that has operational control of a primary control center identified in Requirement R1, Part 1.2 of a Transmission station or Transmission substation verified according to Requirement R2 receives notice of such identification so that the TOP may timely fulfill its resulting obligations under Requirements R4 through R6. Since the timing obligations in Requirements R4 through R6 are based upon completion of Requirement R2, the TO must also include notice of the date of completion of Requirement R2. Similarly, the TO must notify the TOP of any removals from identification that result from a subsequent risk assessment under Requirement R1 or the verification process under Requirement R2.

Rationale for Requirement R4 (This is now Requirement R8 in CIP-014-4):
This requirement meets the FERC directive from paragraph 8 in the order on physical security that the reliability standard must require tailored evaluation of potential threats and vulnerabilities to facilities identified in Requirement R1 and verified according to Requirement R2. Threats and vulnerabilities may vary from facility to facility based on factors such as the facility's location, size, function, existing protections, and attractiveness of the target. As such, the requirement does not mandate a one-size-fits-all approach but requires entities to account for the unique characteristics of their facilities.

Requirement R4 does not explicitly state when the evaluation of threats and vulnerabilities must occur or be completed. However, Requirement R5 requires that the entity's security plan(s), which is dependent on the Requirement R4 evaluation, must be completed within 120 calendar days following completion of Requirement R2. Thus, an entity has the flexibility when to complete the Requirement R4 evaluation, provided that it is completed in time to comply with the requirement in Requirement R5 to develop a physical security plan 120 calendar days following completion of Requirement R2.

Rationale for Requirement R5 (This is now Requirement R9 in CIP-014-4):
This requirement meets the FERC directive from paragraph 9 in the order on physical security requiring the development and implementation of a security plan(s) designed to protect against attacks to the facilities identified in Requirement R1 based on the assessment performed under Requirement R4.

Rationale for Requirement R6 (This is now Requirement R10 in CIP-014-4):
This requirement meets the FERC directive from paragraph 11 in the order on physical security requiring review by an entity other than the owner or operator with appropriate expertise of the evaluation performed according to Requirement R4 and the security plan(s) developed according to Requirement R5.

As with the verification required by Requirement R2, Requirement R6 provides TOs and TOPs the flexibility to work with the third party reviewer throughout the Requirement R4 evaluation and the development of the Requirement R5 security plan(s). This would allow entities to satisfy their obligations under Requirement R6 concurrent with the satisfaction of their obligations under Requirements R4 and R5.

NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

Technical Rationale

Project 2023-06 CIP-014 Risk Assessment Refinement
Reliability Standard CIP-014-4 | ~~June 2025~~March 2026

CIP-014-4 – Physical Security

In performing the risk assessment, the Transmission Owner (TO) should first identify their population of Transmission stations and Transmission substations that meet the criteria contained in Attachment 1. The Standard requires the ~~Transmission Owner~~TO to perform a risk assessment, consisting of transmission analyses to determine which of those Transmission stations and Transmission s~~S~~ubstations, if rendered inoperable or damaged, could result in instability, uncontrolled separation, or Cascading within an Interconnection.

The purpose of Reliability Standard CIP-014 is to protect Transmission stations and Transmission substations, and their associated primary control centers, that if rendered inoperable or damaged, ~~as a result of~~due to a physical attack, could ~~result in~~cause instability, uncontrolled separation, or Cascading within an Interconnection. To properly identify candidates for such Transmission station(s) and Transmission substation(s), the ~~Transmission Owner~~TO shall evaluate the criteria listed in Attachment 1.

Rationale for Requirement R1

The Standard Authorization Request (SAR) directed the drafting team (DT) to clarify the in-service window. It also directed the DT to correct any discrepancies between the study period, frequency of study, and the base case(s) a TO uses. In the previous version of CIP-014, the 30-month time frame and the 24-month planned-to-be-in-service date could, if not carefully applied, lead to gaps between models and study horizons. Per the ~~Standard Authorization Request~~ (SAR), CIP-014-4 has consolidated these multiple timelines into one.

Requirement R1 is revised to ensure that each ~~Transmission Owner~~TO establishes a list of applicable Transmission station(s) or Transmission substation(s) in accordance with Attachment 1. Aligning the 36 calendar months look ahead in Requirement R1 with the 36 calendar months risk assessment cycle ensures that system topology of the cases used to assess applicability is consistent with the system topology in the risk assessment models.

~~Transmission Owners~~TOs shall review and, if necessary, update the list of applicable Transmission station(s) or Transmission substation(s) per Attachment 1 at least once every 36 calendar months. The list of applicable Transmission station(s) or Transmission substation(s) shall include existing ~~or planned to be in service within 36 calendar months~~Facilities and Transmission station(s) and Transmission substation(s)~~.~~ ~~The~~ planned to be in service within 36 calendar months~~ cycle for updating the list of applicable Transmission station(s) or Transmission substation(s) per Attachment 1 aligns with the annual cycle for performing Planning Assessments per NERC Standard TPL-001~~. The 36 calendar months risk assessment study cycle aligns with the 36 calendar months planned-to-be-in-service date. "Planned to be in-service"

should be taken to mean all Transmission station(s) and Transmission substation(s) as modeled in the base cases for the Near-Term Transmission Planning Horizon.

Rationale for Requirement R2

The distance chosen in requirement R2 is based on guidelines that considered a variety of plausible attack scenarios capable of rendering a substation inoperable.

The ~~drafting team~~DT ~~choose~~chose 1,500 feet or 457 meters (the shortest distance, measured substation fence line to substation fence line) in Requirement R2 ~~is based on the study from America's Cyber Defense Agency developed in partnership with the Federal Bureau of Investigation (FBI). The~~after review of the Department of Homeland Security (DHS)-Department of Justice (DOJ) Bomb Threat Stand-Off Card. The Bomb Threat Stand-Off Card is a quick reference guide providing recommended evacuation and shelter-in-place distances for various types and sizes of Improvised Explosive Devices (IED), based on version of August, 2025.[1]

The guidance above allowed the DT to draft language that clarified what study scenario(s) and other study assumptions are appropriate and reasonable considering the intent of CIP-014 and the potential range of issues during a physical attack. Simulations should incorporate the loss of station elements without the reliance on local system protection. Clarifying how to account for adjacent Transmission stations or Transmission substations of differing ownership as well as for those Transmission stations or Transmission substations within line-of-sight to each other. These provide limits to what the TO must study and avoid including an explicit representation of the physical event in the standard.

Accurate simulation of the event was deemed a priority of the ~~Drafting Team (~~DT~~)~~. The DT felt that ownership of proximate substations, as identified in Requirement R2, was irrelevant to Bulk Electric System ~~(BES)~~ impact.

The Transmission station(s) or Transmission substation(s) identified in Requirement R2 are only intended for use in the Requirement R5 risk assessment and the Requirement R6 third-party verification to properly account for additional equipment that, if also damaged during an event, could lead to loss of additional Facilities. They are not intended to be subject to Requirements R7 through R10. Requirements R7 through R10 are only relevant for the Transmission substation(s) or Transmission substation(s) identified in Requirement R1.

Rationale for Requirement R3

The new Requirement R3 fulfills the first item in the SAR to "clarify the risk assessment methods" and that the "methods should account for dynamic studies." Requirement R3 also fulfills other items in the SAR around case selection, technically supported rationales, the loss of communications, and local protection within the affected station. The previous Requirement R3 is now Requirement R7 of CIP-014-4.

[1] https://www.cisa.gov/resources-tools/resources/dhs-doj-bomb-threat-stand-card

Per Requirement R3, each ~~Transmission Owner~~TO is required to have a risk assessment methodology, including the criteria by which analytical results will be examined to identify Transmission station(s) or Transmission substation(s) that if rendered inoperable or damaged as a result of a physical attack could result in instability, uncontrolled separation, or Cascading within an Interconnection. The ~~Transmission Owner~~TO is not required to develop its own methodology and is free to use a methodology developed elsewhere, such as in coordination with neighboring ~~Transmission Owners~~TOs or Independent System Operators (ISOs).

Rationale for Requirement R3, Part 3.1

~~Transmission Owners~~TOs should determine the amount of unacceptable load loss and generation loss within an Interconnection when determining the impact of an event to the Transmission system. The thresholds identifying unacceptable generation and load losses should be the total of the losses within the TO's footprint and losses external to the Transmission Owner's footprint. Criteria for measures such as load loss or generation loss should consider the impact to the Interconnection.

While the use of Recommended Interconnection Resource Loss Protection Criteria (RLPC) provides one approach to generation loss—setting these thresholds based on the two largest potential resource losses in an Interconnection as detailed in Attachment A of NERC Reliability Standard BAL-003-2—other methods may also be appropriate, as determined by the TO. The RLPC values should be taken from the latest approved version of NERC's annual 'Frequency Response Annual Analysis' report.

Use of the RLPC recommendations in accordance with the latest version of NERC's 'Frequency Response Annual Analysis' report is an example of technically justified thresholds for unacceptable generation and load loss within an Interconnection. Use of lower values than the RLPC recommendations is also technically justifiable. Use of higher values than the RLPC recommendations would require additional technical justification.

Large loss of generation or load due to the evaluated disturbance could result in severe System impacts. The documented risk assessment methodology shall include the amount of unacceptable load loss and generation loss, that could result in instability, uncontrolled separation, or Cascading within an Interconnection. Conditions and thresholds used for determining critical Transmission station(s) or Transmission substation(s), i.e., those that if rendered inoperable or damaged as a result of a physical attack could result in instability, uncontrolled separation, or Cascading within an Interconnection, should be part of the documented risk assessment methodology.

It is up to the ~~Transmission Owner~~TO to identify post-event measures that can be used to assess the criticality of a Transmission ~~substation~~station or Transmission substation. Suggested measures are listed below. A ~~Transmission Owner~~TO can decide that one or more of the items are not applicable to their location within the interconnection and if any additional items should be included.

The following parameters can be used to evaluate the steady-state and/or dynamic analysis:

- Steady state voltages

- Transient voltage response
- Thermal loading of Facilities
- Relay loadability
- Rotor angle stability
- Frequency exceeding generator limits
- Frequency stability
- Acceptable damping of oscillations
- Cascading line tripping
- Steady-state voltage stability

Rationale for Requirement R3, Part 3.2
The performance of both steady state and dynamics simulations is required for all applicable Transmission station(s) and substation(s). Dynamic simulations are required by the ~~Standard~~standard because exclusively performing steady-state simulations ~~are~~is insufficient for determining whether the loss of a Transmission station or Transmission substation could result in instability, uncontrolled separation, or Cascading within an Interconnection.

Rationale for Requirement R3, Part 3.3
~~A~~Historically, simulation of a ~~Fault provides a reasonable assumption for possible events that could impact a single~~three-phase Fault at applicable Transmission station~~ or~~(s) and Transmission substation~~, and for events that could simultaneously impact multiple Transmission stations or Transmission substations.~~(s) appears to be the prevalent assumption used by the majority of TOs in the performance of stability analyses for CIP-014 risk assessments. The DT has determined, however, that there may be specific locations or scenarios that merit the use of a different Fault type (or a sequence or progression of multiple Faults) more consistent with the occurrence of a physical attack for those locations or scenarios.

Rationale for Requirement R3, Part ~~3.4~~3.3.1
The ~~requirement that simulations shall assume the loss of communications and system protection is consistent with the SAR. In accordance with the SAR, the term "~~applicable Transmission substation or Transmission station is the station that is assumed to be under attack for the purposes of this standard. Any damage to Transmission Stations or Transmission Substations in proximity is assumed to be collateral damage. The intent of CIP-014 is to cover the case when the applicable Transmission Station or Transmission Substation becomes inoperable~~" includes~~. The SAR refers to the "total loss of communication and protection equipment at the substation~~, necessitating delayed clearance from far-end relaying to isolate the event's impacts.~~." Requirement R3, Part 3.3.1 uses the "prior loss" wording to eliminate difficulties when performing simulations. When exploring possible attack scenarios, it is possible to develop scenarios that allow a fault prior to the loss of communication and protection systems. Protection systems typically operate within a few cycles, so a short delay between the fault and the loss of the protection system could allow breakers to operate. "Prior loss of communication and Protection

Systems" eliminates this possibility, so the fault should be studied without the availability of local communications or Protection Systems. The use of delayed clearing times, typically Zone 2, is necessary because the applicable substation has lost local protection and all communications with other substations.

Rationale for Requirement R3, Part 3.3.2

The relative locations of the applicable Transmission Station or Transmission Substation and the neighboring substation will determine the best way to evaluate and study the combinations of substations. Every substation identified in Requirement R2 must be studied in at least one combination with its applicable Transmission Station or Transmission Substation. For example, if there is a single neighboring substation near the applicable substation, then the applicable and neighboring substation should be studied together. If there are two or more neighboring substations that are close together and both within 1,500 feet of the applicable substation, then the responsible entity may study the applicable substation with the combination of the two neighbors. If there are two or more neighboring substations on different sides of the applicable substation, then it can make more sense to study the applicable substation with each proximity substation individually. For purposes of the simulations, the faults should be applied at the same time or after the faults applied to the applicable Transmission Station or Transmission Substation depending on the simulated event and any restrictions of the simulation software. Not all software packages allow for multiple simultaneous faults. The protection and communication systems at the proximate substations are expected to operate normally, so delayed clearing is not necessary.

Rationale for Requirement R3, Part 3.3.3

The DT believes that requiring documented justification for Faults being selected, without specifying Fault type, allows TOs to determine on a location-by-location basis what is a credible high-severity scenario for a physical attack and furthermore how to appropriately model the associated stability simulations. The DT also believes that a single justification may be used for multiple locations. Requirement 3 Part 3.3.3 allows the TOs to determine the type of fault with documented justification. If a fault type and justification is relevant to multiple Transmission Stations or Transmission Substations, there is no need to repeatedly document the same justification.

Rationale for Requirement R3, Part 3.3.4

Each simulation should ~~also~~ include the removal of all Elements that Protection Systems and other controls are expected to automatically disconnect for the event. After the prior loss of communication and Protection Systems at the applicable Transmission station or Transmission substation, other Protection Systems should operate as expected for the event considered. The accurate simulation of Protection System actions is essential for correctly identifying the risk of instability, uncontrolled separation, or Cascading within an Interconnection.

Rationale for Requirement R3, Part 3.3.5

While there are commonly used generic clearing times for remote clearing that are consistent across the industry, actual clearing times can be shorter or longer depending on conditions and design considerations at an individual ~~Transmission Owner~~TO. The difference of a few cycles can have a

significant impact on the transient behavior of generating units, therefore, it is required that the risk analysis use actual or more conservative clearing ~~time~~times.

Rationale for Requirement R4

Joint ownership of Transmission substations and Transmission stations was discussed in the Guidelines and Technical Basis of previous versions of the CIP-014-3 standard, but ~~the needed prescription on this issue was missing from~~because ownership was not addressed in the standard language~~. Because~~, the CIP-014-4 Risk Assessment Refinement SAR ~~calls for~~required clarification ~~regarding~~which resulted in the new requirement R4. TOs that have applicable jointly owned Transmission substations and Transmission stations ~~of differing ownership, this section was clarified in Requirement R4.~~ should coordinate and document their individual and joint responsibilities for CIP-014-4 Rquirements R3 and R5. TOs should be able to demonstrate sole or joint ownership through one-line diagrams with ownership demarcations and/or a letter of attestation stating which stations are solely or jointly owned.

Rationale for Requirement R5

An objective of the CIP-014-3 Risk Assessment Refinement SAR was to align study periods, frequency of studies, and the powerflow models used for the studies. A 36-month periodicity was chosen for the Requirement R5 risk assessment to reduce the periodicity options from previous versions of the standard. Additionally, a single study periodicity is more easily aligned with project in-service date considerations and model choices. As called for in Project Scope item 3 of the CIP-014-3 Risk Assessment Refinement SAR, the risk assessment must comply with the methodology developed in Requirement R3, so this language was explicitly added to Requirement R5.

~~Transmission Owners~~TOs shall review and, if necessary, update the list of applicable Transmission station(s) ~~or~~ and Transmission substation(s) per Attachment 1 at least once every 36 months. The list of applicable Transmission station(s) or Transmission substation(s) shall include existing or planned to be in service within 36 months Transmission station(s) and Transmission substation(s). The 36-month cycle for updating the list of applicable Transmission station(s) or Transmission substation(s) per Attachment 1 aligns with the annual cycle for performing Planning Assessments per NERC Standard TPL-001. The 36-month risk assessment study cycle aligns with the 36-month planned-to-be-in-service date.

In addition to the performance of the risk assessment using Transmission station(s) and Transmission substation(s) identified in Requirement R1, any proximate Transmission station(s) and Transmission substation(s) identified in Requirement R2 should also be included in the risk assessment. Furthermore, any Transmission station(s) and Transmission substation(s) assessed due to having been identified per Requirement R1 should also be run as part of a proximate Transmission station(s) and Transmission substation(s) group per Requirement R2 if such an identification is made.

Rationale for Requirement R5, Part 5.1

If a ~~Transmission Owner~~TO performs a steady state analysis and identifies a Transmission station or substation that, if rendered inoperable or damaged, could result in instability, uncontrolled separation, or Cascading within an Interconnection, then dynamic analysis is not required for that Transmission station or substation. If a ~~Transmission Owner~~TO performs a dynamic analysis and identifies a Transmission

station or substation that, if rendered inoperable or damaged, could result in instability, uncontrolled separation, or Cascading within an Interconnection, then steady state analysis is not required for that Transmission station or substation.

Rationale for Requirement R5, Part 5.2

The intent of this Requirement is that ~~Transmission Owners~~TOs do not have to reassess already identified and protected Transmission stations or substations (Requirement R5.3 and Requirements R7 through R10 still apply to those Transmission stations or substations). A new risk assessment will need to be performed if the ~~Transmission owner~~TO wishes to determine whether or not a Transmission station or substation can be removed from identification and protection as outlined in Requirement R7.1.

Rationale for Requirement R5, Part 5.3

Identification of Primary Control Centers: After completing the risk assessment under Requirement R5 and verified under Requirement R6, it is important to additionally identify the primary control center that operationally controls each Transmission station or Transmission substation, that if rendered inoperable or damaged could result in instability, uncontrolled separation, or Cascading within an Interconnection. A primary control center "operationally controls" a Transmission station or Transmission substation when the control center's electronic actions can cause direct physical actions at the identified Transmission station and Transmission substation, such as opening a breaker.

Rationale for Implementation Plan

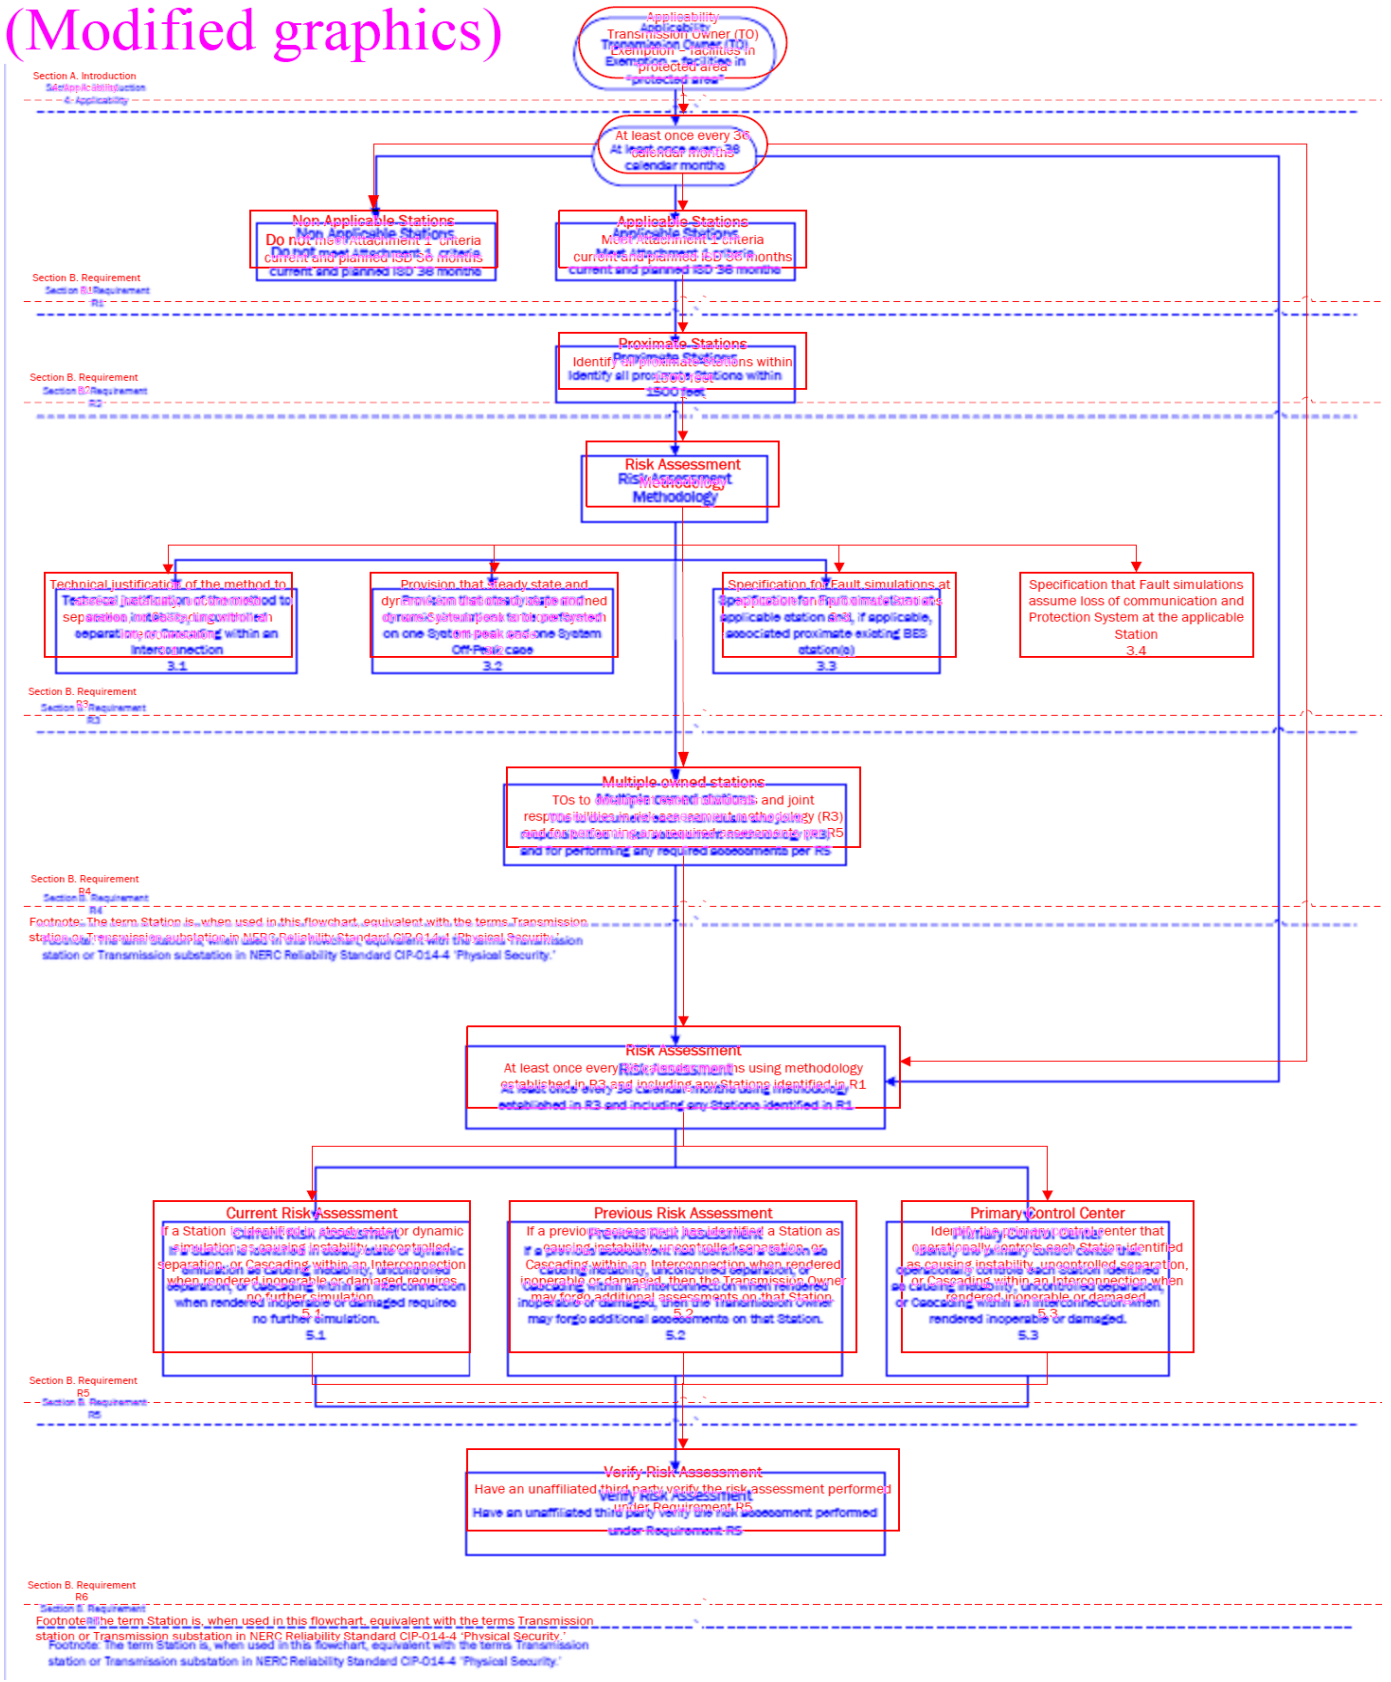
~~The Drafting Team~~In developing the Implementation Plan, the DT has determined that 24 calendar months for the CIP-014-4 implementation plan would allow adequate time for ~~Transmission Owners~~TOs and ~~Transmission Operators~~TOPs to determine applicability, develop criteria, write or revise methodologies, perform assessments, and procure unaffiliated third parties for risk assessment verification (which some ~~Transmission Owners~~TOs have performed concurrently with their risk assessment analyses.

Furthermore, given a) FERC's sense of urgency stated in their original Order to revise CIP-014 (Docket No. RD23-2-000, issued December 15, 2022), b) the findings of NERC's report to FERC on April 14, 2023 (Evaluation of the Physical Security Reliability Standard and Physical Security Attacks to the Bulk-Power System), and c) the designation of Project 2023-06 as High Priority, the DT has determined that an Implementation Plan schedule of greater than 24 calendar months would not be responsive to FERC's concerns with sufficient urgency, and thus 24 calendar months is an appropriate timeframe. While the DT understands the time and resources required of entities to respond to this Implementation Plan, the DT believes that 24 calendar months properly balances the need to address the reliability risk and the time needed by entities to determine applicability, develop criteria, write or revise methodologies, perform assessments, and procure unaffiliated third parties for risk assessment verification.

CIP-014-4 Flowchart

The flowchart is a concise outline that guides through the steps for completing the risk assessment at least once every 36 calendar months, based on the Applicability in Attachment 1 and Requirements R1-R5.

(Modified graphics)



Technical Rationale for Reliability Standard CIP-014-3

This section contains a "cut and paste" of the former Guidelines and Technical Basis (GTB) as-is of from CIP-014-3 standard to preserve any historical references. No modifications have been made.

Requirement R2 (This is Requirement R6 in CIP-014-4)
This requirement specifies verification of the risk assessment performed under Requirement R1 by an entity other than the owner or operator of the Requirement R1 risk assessment.

A verification of the risk assessment by an unaffiliated third party, as specified in Requirement R2, could consist of:

1. Certifying that the Requirement R1 risk assessment considers the Transmission stations and Transmission substations identified in Applicability Section 4.1.1.
2. Review of the model used to conduct the risk assessment to ensure it contains sufficient system topology to identify Transmission stations and Transmission substations that if rendered inoperable or damaged could cause instability, uncontrolled separation, or Cascading within an Interconnection.
3. Review of the Requirement R1 risk assessment methodology.

This requirement provides the flexibility for a Transmission Owner to select from unaffiliated registered and non-registered entities with transmission planning or analysis experience to perform the verification of the Requirement R1 risk assessment. The term unaffiliated means that the selected verifying entity cannot be a corporate affiliate (*i.e.,* the verifying or third party reviewer cannot be an entity that corporately controls, is controlled by or is under common control with, the Transmission Owner). The verifying entity also cannot be a division of the Transmission Owner that operates as a functional unit.

The prohibition on registered entities using a corporate affiliate to conduct the verification, however, does not prohibit a governmental entity (e.g., a city, a municipality, a U.S. federal power marketing agency, or any other political subdivision of U.S. or Canadian federal, state, or provincial governments) from selecting as the verifying entity another governmental entity within the same political subdivision. For instance, a U.S. federal power marketing agency may select as its verifier another U.S. federal agency to conduct its verification so long as the selected entity has transmission planning or analysis experience. Similarly, a Transmission Owner owned by a Canadian province can use a separate agency of that province to perform the verification. The verifying entity, however, must still be a third party and cannot be a division of the registered entity that operates as a functional unit.

Requirement R2 also provides that the "verification may occur concurrent with or after the risk assessment performed under Requirement R1." This provision is designed to provide the Transmission Owner the flexibility to work with the verifying entity throughout (*i.e.,* concurrent with) the risk assessment, which for some Transmission Owners may be more efficient and effective. In other words, a Transmission Owner could collaborate with their unaffiliated verifying entity to perform the risk assessment under Requirement R1 such that both Requirement R1 and Requirement R2 are satisfied

concurrently. The intent of Requirement R2 is to have an entity other than the owner or operator of the facility to be involved in the risk assessment process and have an opportunity to provide input. Accordingly, Requirement R2 is designed to allow entities the discretion to have a two-step process, where the Transmission Owner performs the risk assessment and subsequently has a third party review that assessment, or a one-step process, where the entity collaborates with a third party to perform the risk assessment.

Characteristics to consider in selecting a third party reviewer could include:

- Registered Entity with applicable planning and reliability functions.
- Experience in power system studies and planning.
- The entity's understanding of the MOD standards, TPL standards, and facility ratings as they pertain to planning studies.
- The entity's familiarity with the Interconnection within which the Transmission Owner is located.

With respect to the requirement that Transmission owners develop and implement procedures for protecting confidential and sensitive information, the Transmission Owner could have a method for identifying documents that require confidential treatment. One mechanism for protecting confidential or sensitive information is to prohibit removal of sensitive or confidential information from the Transmission Owner's site. Transmission Owners could include such a prohibition in a non-disclosure agreement with the verifying entity.

A Technical feasibility study is not required in the Requirement R2 documentation of the technical basis for not modifying the identification in accordance with the recommendation.

On the issue of the difference between a verifier in Requirement R2 and a reviewer in Requirement R6, the SDT indicates that the verifier will confirm that the risk assessment was completed in accordance with Requirement R1, including the number of Transmission stations and substations identified, while the reviewer in Requirement R6 is providing expertise on the manner in which the evaluation of threats was conducted in accordance with Requirement R4, and the physical security plan in accordance with Requirement R5. In the latter situation there is no verification of a technical analysis, rather an application of experience and expertise to provide guidance or recommendations, if needed.

Parts 2.4 and 6.4 require the entities to have procedures to protect the confidentiality of sensitive or confidential information. Those procedures may include the following elements:

1. Control and retention of information on site for third party verifiers/reviewers.
2. Only "need to know" employees, etc., get the information.
3. Marking documents as confidential
4. Securely storing and destroying information when no longer needed.

5. Not releasing information outside the entity without, for example, General Counsel sign-off.

Requirement R3 (This is now Requirement R7 in CIP-014-4)
Some Transmission Operators will have obligations under this standard for certain primary control centers. Those obligations, however, are contingent upon a Transmission Owner first completing the risk assessment specified by Requirement R1 and the verification specified by Requirement R2. Requirement R3 is intended to ensure that a Transmission Operator that has operational control of a primary control center identified in Requirement R1 receive notice so that the Transmission Operator may fulfill the rest of the obligations required in Requirements R4 through R6. Since the timing obligations in Requirements R4 through R6 are based upon completion of Requirement R2, the Transmission Owner must also include within the notice the date of completion of Requirement R2. Similarly, the Transmission Owner must notify the Transmission Operator of any removals from identification that result from a subsequent risk assessment under Requirement R1 or as a result of the verification process under Requirement R2.

Requirement R4 (This is now Requirement R8 in CIP-014-4)
This requirement requires owners and operators of facilities identified by the Requirement R1 risk assessment and that are verified under Requirement R2 to conduct an assessment of potential threats and vulnerabilities to those Transmission stations, Transmission substations, and primary control centers using a tailored evaluation process. Threats and vulnerabilities may vary from facility to facility based on any number of factors that include, but are not limited to, location, size, function, existing physical security protections, and attractiveness as a target.

In order to effectively conduct a threat and vulnerability assessment, the asset owner may be the best source to determine specific site vulnerabilities, but current and evolving threats may best be determined by others in the intelligence or law enforcement communities. A number of resources have been identified in the standard, but many others exist and asset owners are not limited to where they may turn for assistance. Additional resources may include state or local fusion centers, U.S. Department of Homeland Security, Federal Bureau of Investigations (FBI), Public Safety Canada, Royal Canadian Mounted Police, and InfraGard chapters coordinated by the FBI.

The Responsible Entity is required to take a number of factors into account in Parts 4.1 to 4.3 in order to make a risk-based evaluation under Requirement R4.

To assist in determining the current threat for a facility, the prior history of attacks on similarly protected facilities should be considered when assessing probability and likelihood of occurrence at the facility in question.

Resources that may be useful in conducting threat and vulnerability assessments include:

- NERC Security Guideline for the Electricity Sector: Physical Security.
- NERC Security Guideline: Physical Security Response.

- ASIS International General Risk Assessment Guidelines.
- ASIS International Facilities Physical Security Measure Guideline.
- ASIS International Security Management Standard: Physical Asset Protection.
- Whole Building Design Guide - Threat/Vulnerability Assessments.

Requirement R5 (This is now Requirement R9 in CIP-014-4)
This requirement specifies development and implementation of a security plan(s) designed to protect against attacks to the facilities identified in Requirement R1 based on the assessment performed under Requirement R4.

Requirement R5 specifies the following attributes for the physical security plan:

- *Resiliency or security measures designed collectively to deter, detect, delay, assess, communicate, and respond to potential physical threats and vulnerabilities identified during the evaluation conducted in Requirement R4.*

  Resiliency may include, among other things:

  a. System topology changes,

  b. Spare equipment,

  c. Construction of a new Transmission station or Transmission substation.

  While most security measures will work together to collectively harden the entire site, some may be allocated to protect specific critical components. For example, if protection from gunfire is considered necessary, the entity may only install ballistic protection for critical components, not the entire site.

- *Law enforcement contact and coordination information.*

  Examples of such information may be posting 9-1-1 for emergency calls and providing substation safety and familiarization training for local and federal law enforcement, fire department, and Emergency Medical Services.

- *A timeline for executing the physical security enhancements and modifications specified in the physical security plan.*

  Entities have the flexibility to prioritize the implementation of the various resiliency or security enhancements and modifications in their security plan according to risk, resources, or other factors. The requirement to include a timeline in the physical security plan for executing the actual physical security enhancements and modifications does not also require that the enhancements and modifications be completed within 120 days. The actual timeline may extend beyond the 120 days, depending on the amount of work to be completed.

- *Provisions to evaluate evolving physical threats, and their corresponding security measures, to the Transmission station(s), Transmission substation(s), or primary control center(s).*

A registered entity's physical security plan should include processes and responsibilities for obtaining and handling alerts, intelligence, and threat warnings from various sources. Some of these sources could include the ERO, ES-ISAC, and US and/or Canadian federal agencies. This information should be used to reevaluate or consider changes in the security plan and corresponding security measures of the security plan found in R5.

Incremental changes made to the physical security plan prior to the next required third party review do not require additional third party reviews.

Requirement R6 (This is now Requirement R10 in CIP-014-4)

This requirement specifies review by an entity other than the Transmission Owner or Transmission Operator with appropriate expertise for the evaluation performed according to Requirement R4 and the security plan(s) developed according to Requirement R5. As with Requirement R2, the term unaffiliated means that the selected third party reviewer cannot be a corporate affiliate (*i.e.,* the third party reviewer cannot be an entity that corporately controls, is controlled by or is under common control with, the Transmission Operator). A third party reviewer also cannot be a division of the Transmission Operator that operates as a functional unit.

As noted in the guidance for Requirement R2, the prohibition on registered entities using a corporate affiliate to conduct the review, however, does not prohibit a governmental entity from selecting as the third party reviewer another governmental entity within the same political subdivision. For instance, a city or municipality may use its local enforcement agency, so long as the local law enforcement agency satisfies the criteria in Requirement R6. The third party reviewer, however, must still be a third party and cannot be a division of the registered entity that operates as a functional unit.

The Responsible Entity can select from several possible entities to perform the review:

- *An entity or organization with electric industry physical security experience and whose review staff has at least one member who holds either a Certified Protection Professional (CPP) or Physical Security Professional (PSP) certification.*

  In selecting CPP and PSP for use in this standard, the SDT believed it was important that if a private entity such as a consulting or security firm was engaged to conduct the third party review, they must tangibly demonstrate competence to conduct the review. This includes electric industry physical security experience and either of the premier security industry certifications sponsored by ASIS International. The ASIS certification program was initiated in 1977, and those that hold the CPP certification are board certified in security management. Those that hold the PSP certification are board certified in physical security.

- *An entity or organization approved by the ERO.*
- *A governmental agency with physical security expertise.*
- *An entity or organization with demonstrated law enforcement, government, or military physical security expertise.*

As with the verification under Requirement R2, Requirement R6 provides that the "review may occur concurrently with or after completion of the evaluation performed under Requirement R4 and the security plan development under Requirement R5." This provision is designed to provide applicable Transmission Owners and Transmission Operators the flexibility to work with the third party reviewer throughout (*i.e.,* concurrent with) the evaluation performed according to Requirement R4 and the security plan(s) developed according to Requirement R5, which for some Responsible Entities may be more efficient and effective. In other words, a Transmission Owner or Transmission Operator could collaborate with their unaffiliated third party reviewer to perform an evaluation of potential threats and vulnerabilities (Requirement R4) and develop a security plan (Requirement R5) to satisfy Requirements R4 through R6 simultaneously. The intent of Requirement R6 is to have an entity other than the owner or operator of the facility to be involved in the Requirement R4 evaluation and the development of the Requirement R5 security plans and have an opportunity to provide input on the evaluation and the security plan. Accordingly, Requirement R6 is designed to allow entities the discretion to have a two-step process, where the Transmission Owner performs the evaluation and develops the security plan itself and then has a third party review that assessment, or a one-step process, where the entity collaborates with a third party to perform the evaluation and develop the security plan.

Rationale for Attachment 1

The DT moved the applicability language from CIP-014-3 to Attachment 1 to make the standard easier to read.

The purpose of Reliability Standard CIP-014 is to protect Transmission stations and Transmission substations, and their associated primary control centers that if rendered inoperable or damaged as a result of a physical attack could result in instability, uncontrolled separation, or Cascading within an Interconnection. To properly include those entities that own or operate such Facilities, the Reliability Standard CIP-014 first applies to Transmission Owners that own Transmission Facilities that meet the specific criteria in Applicability Section 4.1.1.1 through 4.1.1.4. The Facilities described in Applicability Section 4.1.1.1 through 4.1.1.4 mirror those Transmission Facilities that meet the bright line criteria for "Medium Impact" Transmission Facilities under Attachment 1 of Reliability Standard CIP-002-5.1. Each Transmission Owner that owns Transmission Facilities that meet the criteria in Section 4.1.1.1 through 4.1.1.4 is required to perform a risk assessment as specified in Requirement R1 to identify its Transmission stations and Transmission substations, and their associated primary control centers, that if rendered inoperable or damaged as a result of a physical attack could result in instability, uncontrolled separation, or Cascading within an Interconnection. The Standard Drafting Team (SDT) expects this population will be small and that many Transmission Owners that meet the applicability of this standard will not actually identify any such Facilities. Only those Transmission Owners with Transmission stations or Transmission substations identified in the risk assessment (and verified under Requirement R2) have performance obligations under Requirements R3 through R6.

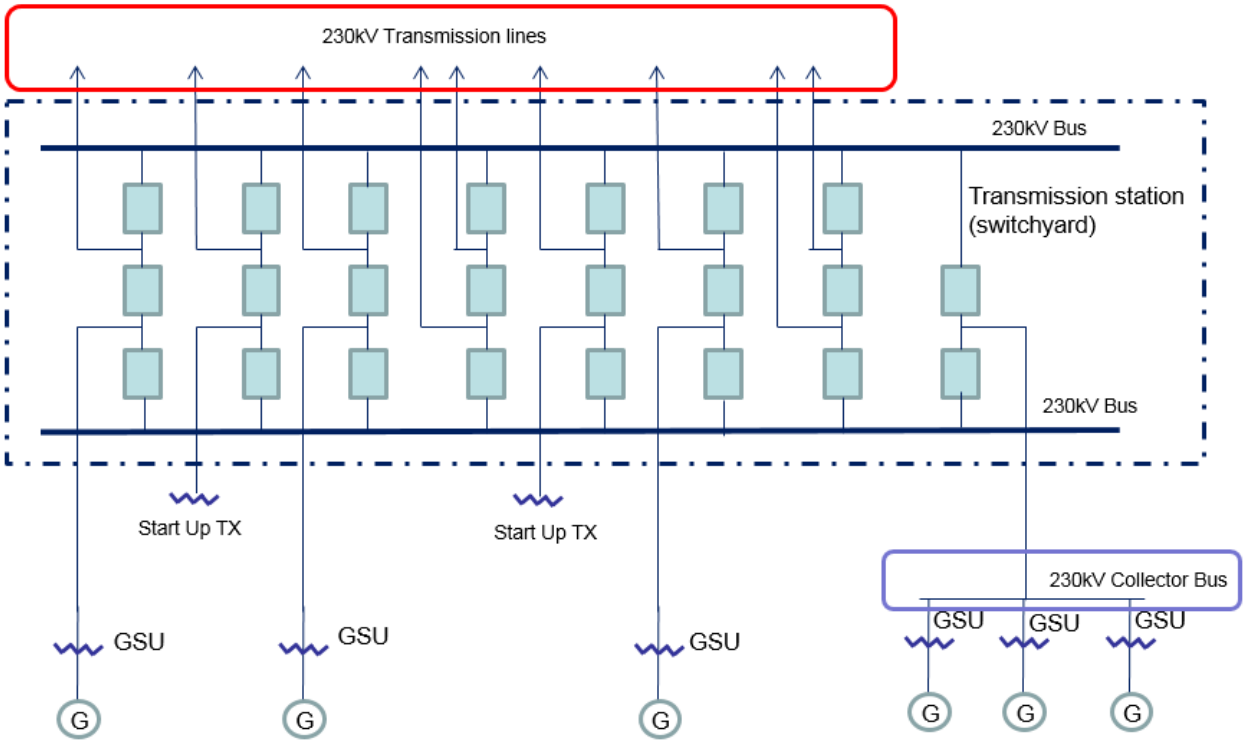
This standard also applies to Transmission Operators. A Transmission Operator's obligations under the standard, however, are only triggered if the Transmission Operator is notified by an applicable Transmission Owner under Requirement R3 that the Transmission Operator operates a primary control center that operationally controls a Transmission station(s) or Transmission substation(s) identified in the Requirement R1 risk assessment. A primary control center operationally controls a Transmission station

or Transmission substation when the control center's electronic actions can cause direct physical action at the identified Transmission station or Transmission substation, such as opening a breaker, as opposed to a control center that only has information from the Transmission station or Transmission substation and must coordinate direct action through another entity. Only Transmission Operators who are notified that they have primary control centers under this standard have performance obligations under Requirements R4 through R6. In other words, primary control center for purposes of this Standard is the control center that the Transmission Owner or Transmission Operator, respectively, uses as its primary, permanently-manned site to physically operate a Transmission station or Transmission substation that is identified in Requirement R1 and verified in Requirement R2. Control centers that provide back-up capability are not applicable, as they are a form of resiliency and intentionally redundant.

The SDT considered several options for bright line criteria that could be used to determine applicability and provide an initial threshold that defines the set of Transmission stations and Transmission substations that would meet the directives of the FERC order on physical security (*i.e.*, those that could cause instability, uncontrolled separation, or Cascading within an Interconnection). The SDT determined that using the criteria for Medium Impact Transmission Facilities in Attachment 1 of CIP-002-5.1 would provide a conservative threshold for defining which Transmission stations and Transmission substations must be included in the risk assessment in Requirement R1 of CIP-014. Additionally, the SDT concluded that using the CIP-002-5.1 Medium Impact criteria was appropriate because it has been approved by stakeholders, NERC, and FERC, and its use provides a technically sound basis to determine which Transmission Owners should conduct the risk assessment. As described in CIP-002-5.1, the failure of a Transmission station or Transmission substation that meets the Medium Impact criteria could have the capability to result in exceeding one or more Interconnection Reliability Operating Limits (IROLs). The SDT understands that using this bright line criteria to determine applicability may require some Transmission Owners to perform risk assessments under Requirement R1 that will result in a finding that none of their Transmission stations or Transmission substations would pose a risk of instability, uncontrolled separation, or Cascading within an Interconnection. However, the SDT determined that higher bright lines could not be technically justified to ensure inclusion of all Transmission stations and Transmission substations, and their associated primary control centers that, if rendered inoperable or damaged as a result of a physical attack could result in instability, uncontrolled separation, or Cascading within an Interconnection. Further guidance and technical basis for the bright line criteria for Medium Impact Facilities can be found in the Guidelines and Technical Basis section of CIP-002-5.1.

Additionally, the SDT determined that it was not necessary to include Generator Operators and Generator Owners in the Reliability Standard. First, Transmission stations or Transmission substations interconnecting generation facilities are considered when determining applicability. Transmission Owners will consider those Transmission stations and Transmission substations that include a Transmission station on the high side of the Generator Step-up transformer (GSU) using Applicability Section 4.1.1.1 and 4.1.1.2. As an example, a Transmission station or Transmission substation identified as a Transmission Owner facility that interconnects generation will be subject to the Requirement R1 risk assessment if it operates at 500kV or greater or if it is connected at 200 kV – 499kV to three or more other Transmission stations or Transmission substations and has an "aggregate weighted value" exceeding 3000 according to the table in Applicability Section 4.1.1.2. Second, the Transmission analysis or analyses conducted under

Requirement R1 should take into account the impact of the loss of generation connected to applicable Transmission stations or Transmission substations. Additionally, the FERC order does not explicitly mention generation assets and is reasonably understood to focus on the most critical Transmission Facilities. The diagram below shows an example of a station.

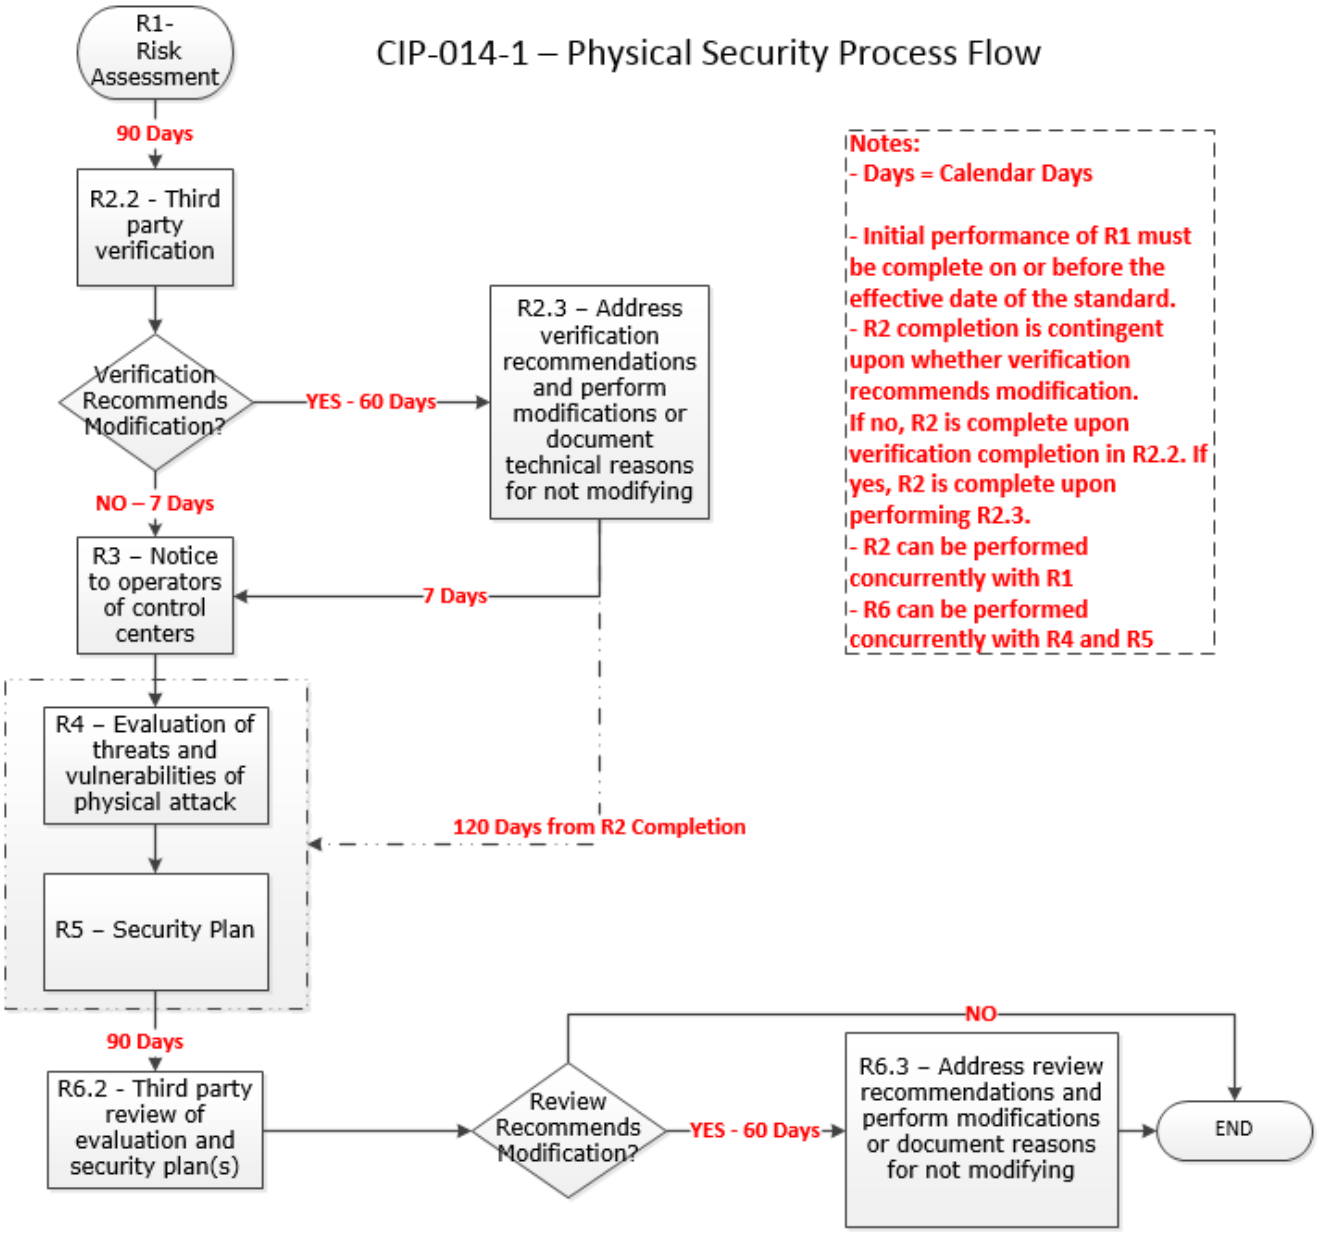


Also, the SDT uses the phrase "Transmission stations or Transmission substations" to recognize the existence of both stations and substations. Many entities in industry consider a substation to be a location with physical borders (i.e. fence, wall, etc.) that contains at least an autotransformer. Locations also exist that do not contain autotransformers, and many entities in industry refer to those locations as stations (switching stations or switchyards). Therefore, the SDT chose to use both "station" and "substation" to refer to the locations where groups of Transmission Facilities exist.

On the issue of joint ownership, the SDT recognizes that this issue is not unique to CIP-014, and expects that the applicable Transmission Owners and Transmission Operators will develop memorandums of understanding, agreements, Coordinated Functional Registrations, or procedures, etc., to designate responsibilities under CIP-014 when joint ownership is at issue, which is similar to what many entities have completed for other Reliability Standards.

The language contained in the applicability section regarding the collector bus is directly copied from CIP-002-5.1, Attachment 1, and has no additional meaning within the CIP-014 standard.

Timeline



CIP-014-1 – Physical Security Process Flow
R1- Risk Assessment
90 Days
R2.2 - Third party verification
Verification Recommends Modification?
YES - 60 Days
R2.3 – Address verification recommendations and perform modifications or document technical reasons for not modifying
NO – 7 Days
R3 – Notice to operators of control centers
7 Days
R4 – Evaluation of threats and vulnerabilities of physical attack
120 Days from R2 Completion
R5 – Security Plan
90 Days
R6.2 - Third party review of evaluation and security plan(s)
Review Recommends Modification?
YES - 60 Days
NO
R6.3 – Address review recommendations and perform modifications or document reasons for not modifying
END
Notes:
- Days = Calendar Days
- Initial performance of R1 must be complete on or before the effective date of the standard.
- R2 completion is contingent upon whether verification recommends modification. If no, R2 is complete upon verification completion in R2.2. If yes, R2 is complete upon performing R2.3.
- R2 can be performed concurrently with R1
- R6 can be performed concurrently with R4 and R5

Rationale

During development of this standard, text boxes were embedded within the standard to explain the rationale for various parts of the standard. Upon BOT approval, the text from the rationale text boxes was moved to this section.

Rationale for Requirement R1 (This is for the old Requirement R1 in CIP-014-3):
This requirement meets the FERC directive from paragraph 6 of its March 7, 2014 order on physical security to perform a risk assessment to identify which facilities if rendered inoperable or damaged could impact an Interconnection through instability, uncontrolled separation, or cascading failures. The requirement is not intended to bring within the scope of the standard a Transmission station or Transmission substation unless the applicable Transmission Owner determines through technical studies and analyses based on objective analysis, technical expertise, operating experience and experienced judgment that the loss of such facility would have a critical impact on the operation of the Interconnection in the event the asset is rendered inoperable or damaged. In the November 20, 2014 Order, FERC reiterated that "only an instability that has a "critical impact on the operation of the interconnection" warrants finding that the facility causing the instability is critical under Requirement R1." The Transmission Owner may determine the criteria for critical impact by considering, among other criteria, any of the following:

- Criteria or methodology used by Transmission Planners or Planning Coordinators in TPL-001-4, Requirement R6
- NERC EOP-004-2 reporting criteria
- Area or magnitude of potential impact

Requirement R1 also meets the FERC directive for periodic reevaluation of the risk assessment by requiring the risk assessment to be performed every 30 months (or 60 months for an entity that has not identified in a previous risk assessment any Transmission stations or Transmission substations that if rendered inoperable or damaged could result in instability, uncontrolled separation, or Cascading within an Interconnection).

After identifying each Transmission station and Transmission substation that meets the criteria in Requirement R1, it is important to additionally identify the primary control center that operationally controls that Transmission station or Transmission substation (*i.e.,* the control center whose electronic actions can cause direct physical actions at the identified Transmission station and Transmission substation, such as opening a breaker, compared to a control center that only has the ability to monitor the Transmission station and Transmission substation and, therefore, must coordinate direct physical action through another entity).

Rationale for Requirement R2 (This is now Requirement R6 in CIP-014-4):
This requirement meets the FERC directive from paragraph 11 in the order on physical security requiring verification by an entity other than the owner or operator of the risk assessment performed under Requirement R1.

This requirement provides the flexibility for a Transmission Owner to select registered and non-registered entities with transmission planning or analysis experience to perform the verification of the Requirement R1 risk assessment. The term "unaffiliated" means that the selected verifying entity cannot be a corporate affiliate (*i.e.*, the verifying entity cannot be an entity that controls, is controlled by, or is under common control with, the Transmission owner). The verifying entity also cannot be a division of the Transmission Owner that operates as a functional unit. The term "unaffiliated" is not intended to prohibit a governmental entity from using another government entity to be a verifier under Requirement R2.

Requirement R2 also provides the Transmission Owner the flexibility to work with the verifying entity throughout the Requirement R1 risk assessment, which for some Transmission Owners may be more efficient and effective. In other words, a Transmission Owner could coordinate with their unaffiliated verifying entity to perform a Requirement R1 risk assessment to satisfy both Requirement R1 and Requirement R2 concurrently.

Planning Coordinator is a functional entity listed in Part 2.1. The Planning Coordinator and Planning Authority are the same entity as shown in the NERC Glossary of Terms Used in NERC Reliability Standards.

Rationale for Requirement R3 (This is now Requirement R7 in CIP-014-4):
Some Transmission Operators will have obligations under this standard for certain primary control centers. Those obligations, however, are contingent upon a Transmission Owner first identifying which Transmission stations and Transmission substations meet the criteria specified by Requirement R1, as verified according to Requirement R2. This requirement is intended to ensure that a Transmission Operator that has operational control of a primary control center identified in Requirement R1, Part 1.2 of a Transmission station or Transmission substation verified according to Requirement R2 receives notice of such identification so that the Transmission Operator may timely fulfill its resulting obligations under Requirements R4 through R6. Since the timing obligations in Requirements R4 through R6 are based upon completion of Requirement R2, the Transmission Owner must also include notice of the date of completion of Requirement R2. Similarly, the Transmission Owner must notify the Transmission Operator of any removals from identification that result from a subsequent risk assessment under Requirement R1 or the verification process under Requirement R2.

Rationale for Requirement R4 (This is now Requirement R8 in CIP-014-4):
This requirement meets the FERC directive from paragraph 8 in the order on physical security that the reliability standard must require tailored evaluation of potential threats and vulnerabilities to facilities identified in Requirement R1 and verified according to Requirement R2. Threats and vulnerabilities may vary from facility to facility based on factors such as the facility's location, size, function, existing protections, and attractiveness of the target. As such, the requirement does not mandate a one-size-fits-all approach but requires entities to account for the unique characteristics of their facilities.

Requirement R4 does not explicitly state when the evaluation of threats and vulnerabilities must occur or be completed. However, Requirement R5 requires that the entity's security plan(s), which is dependent on the Requirement R4 evaluation, must be completed within 120 calendar days following completion of Requirement R2. Thus, an entity has the flexibility when to complete the Requirement R4 evaluation,

provided that it is completed in time to comply with the requirement in Requirement R5 to develop a physical security plan 120 calendar days following completion of Requirement R2.

Rationale for Requirement R5 (This is now Requirement R9 in CIP-014-4):
This requirement meets the FERC directive from paragraph 9 in the order on physical security requiring the development and implementation of a security plan(s) designed to protect against attacks to the facilities identified in Requirement R1 based on the assessment performed under Requirement R4.

Rationale for Requirement R6 (This is now Requirement R10 in CIP-014-4):
This requirement meets the FERC directive from paragraph 11 in the order on physical security requiring review by an entity other than the owner or operator with appropriate expertise of the evaluation performed according to Requirement R4 and the security plan(s) developed according to Requirement R5.

As with the verification required by Requirement R2, Requirement R6 provides Transmission Owners and Transmission Operators the flexibility to work with the third party reviewer throughout the Requirement R4 evaluation and the development of the Requirement R5 security plan(s). This would allow entities to satisfy their obligations under Requirement R6 concurrent with the satisfaction of their obligations under Requirements R4 and R5.

Standards Announcement

Project 2023-06 CIP-014 Risk Assessment Refinement
CIP-014-4

Be aware that this is a public proceeding, and comments are publicly available upon submission. DO NOT include any CEII or otherwise sensitive information in your comments.

Formal Comment Period Open through May 14, 2026

Now Available

A 45-day formal comment period for draft three of **CIP-014-4 Physical Security**, is open through **8 p.m. Eastern, Thursday, May 14, 2026**.

The drafting team's considerations of the responses received from the previous comment period are reflected in this draft of the standard.

Reminder Regarding Corporate RBB Memberships

Under the NERC Rules of Procedure, each entity and its affiliates is collectively permitted one voting membership per Registered Ballot Body Segment. Each entity that undergoes a change in corporate structure (such as a merger or acquisition) that results in the entity or affiliated entities having more than the one permitted representative in a particular Segment must withdraw the duplicate membership(s) prior to joining new ballot pools or voting on anything as part of an existing ballot pool. Contact ballotadmin@nerc.net to assist with the removal of any duplicate registrations.

Commenting

Use the Standards Balloting and Commenting System (SBS) to submit comments. An unofficial Word version of the comment form is posted on the project page.

- *Contact NERC IT support directly at https://support.nerc.net/ (Monday – Friday, 8 a.m. - 5 p.m. Eastern) for problems regarding accessing the SBS due to a forgotten password, incorrect credential error messages, or system lock-out.*
- *Passwords expire every **6 months** and must be reset.*
- *The SBS **is not** supported for use on mobile devices.*
- *Please be mindful of ballot and comment period closing dates. We ask to **allow at least 48 hours** for NERC support staff to assist with inquiries. Therefore, it is recommended that users try logging into their SBS accounts **prior to the last day** of a comment/ballot period.*

Next Steps

Additional ballots for the standard and Implementation Plan, as well as a non-binding poll of the associated Violation Risk Factors and Violation Severity Levels, will be conducted **May 5 - May 14, 2026**.

For more information on the Standards Development Process, refer to the Standard Processes Manual.

For more information or assistance, please contact **Ben Wu** via email or at **470-542-6882**. Subscribe to this project's observer mailing list by logging into EasyVista using your ERO portal account. Select "Mailing List Requests" at the bottom of the screen, then click "Create Request" under the "Standards Team Lists" section. Specify "Project 2023-06 CIP-014 - Risk Assessment Refinement observer list" in the Description Box.

NOTE: To create an ERO account, go to the ERO Portal and register for a new account.

Project 2023-06 CIP-014 Risk Assessment Refinement

Additional Ballot and Non-Binding Poll Open through May 14, 2026

Now Available

Additional ballots for the standard and Implementation Plan, as well as a non-binding poll of the associated Violation Risk Factors and Violation Severity Levels are open through **8 p.m. Eastern, Thursday, May 14, 2026.**

The drafting team's considerations of the responses received from the last comment period are reflected in this draft of the standard.

Reminder Regarding Corporate RBB Memberships

Under the NERC Rules of Procedure, each entity and its affiliates is collectively permitted one voting membership per Registered Ballot Body Segment. Each entity that undergoes a change in corporate structure (such as a merger or acquisition) that results in the entity or affiliated entities having more than the one permitted representative in a particular Segment must withdraw the duplicate membership(s) prior to joining new ballot pools or voting on anything as part of an existing ballot pool. Contact ballotadmin@nerc.net to assist with the removal of any duplicate registrations.

Balloting

Members of the ballot pools associated with this project can log in and submit their votes by accessing the Standards Balloting and Commenting System (SBS) here.

Note: Votes cast in previous ballots, will not carry over to additional ballots. It is the responsibility of the registered voter in the ballot pools to place votes again. To ensure a quorum is reached, if you do not want to vote affirmative or negative, cast an abstention.

- *Contact NERC IT support directly at https://support.nerc.net/ (Monday – Friday, 8 a.m. - 5 p.m. Eastern) for problems regarding accessing the SBS due to a forgotten password, incorrect credential error messages, or system lock-out.*
- *Passwords expire every **6 months** and must be reset.*
- *The SBS **is not** supported for use on mobile devices.*
- *Please be mindful of ballot and comment period closing dates. We ask to **allow at least 48 hours** for NERC support staff to assist with inquiries. Therefore, it is recommended that users try logging into their SBS accounts **prior to the last day** of a comment/ballot period.*

Next Steps

The ballot results will be announced and posted on the project page. The drafting team will review all responses received during the comment period and determine the next steps of the project.

For more information on the Standards Development Process, refer to the Standard Processes Manual

For more information or assistance, please contact **Ben Wu** via email or at **470-542-6882**. Unofficial Comment Form

Project 2023-06 CIP-014 Risk Assessment Refinement

Be aware that this is a public proceeding, and comments are publicly available upon submission. DO NOT include any CEII or otherwise sensitive information in your comments.

Do not use this form for submitting comments. Use the Standards Balloting and Commenting System (SBS) to submit comments on draft three of **CIP-014-4 Physical Security** by **8 p.m. Eastern, Thursday, May 14, 2026.**

Additional information is available on the project page. If you have questions, contact Senior Standards Developer, Ben Wu (via email), or at 470-542-6882.

Background Information

Due to an increase in reports of physical attacks on electric substations, the Federal Energy Regulatory Commission (FERC) issued the December 2022 Order in Docket No. RD23-2-000 directing NERC to evaluate the effectiveness of the Physical Security Reliability Standard CIP-014-3 in mitigating the risks to the Bulk-Power System associated with physical attacks. In the report filed in response to a FERC directive, NERC staff identified continuing inconsistency in registered entity CIP-014-3 risk assessments to most appropriately identify critical infrastructure. FERC directed NERC to evaluate whether the physical security protection requirements in NERC's Reliability Standards are adequate to address the risks associated with physical attacks on Bulk-Power System Facilities, including the adequacy of the required risk assessment in CIP-014-3 Requirement R1. In the report, NERC found that CIP-014-3 required revision to assure adequate and consistent approach in evaluating instability as well as the identification of infrastructure critical to the operation of the Bulk-Power System.

Questions

1. Do you agree with the modifications made in CIP-014-4 with modified Requirement R1 to address the issues identified in the standard authorization request (SAR)? If you do not agree, please provide your recommendation and, if appropriate, technical or procedural justification.

   ☐ Yes
   ☐ No

   Comments:

2. Do you agree with the modifications made in CIP-014-4 with new Requirement R2 to address the issues identified in the SAR? If you do not agree, please provide your recommendation and, if appropriate, technical or procedural justification.

   ☐ Yes
   ☐ No

   Comments:

3. Do you agree with the modifications made in CIP-014-4 with new Requirement R3 to address the issues identified in the SAR? If you do not agree, please provide your recommendation and, if appropriate, technical or procedural justification.

   ☐ Yes
   ☐ No

   Comments:

4. Do you agree with the modifications made in CIP-014-4 with new Requirement R4 to address the issues identified in the SAR? If you do not agree, please provide your recommendation and, if appropriate, technical or procedural justification.

   ☐ Yes
   ☐ No

   Comments:

5. Do you agree with the modifications made in CIP-014-4 with adding Requirement R5 to address the issues identified in the SAR? If you do not agree, please provide your recommendation and, if appropriate, technical or procedural justification.

   ☐ Yes
   ☐ No

   Comments:

6. Do you agree with the Implementation Plan for CIP-014-4? If you think an alternate timeframe is needed, please propose an alternate implementation plan with a detailed explanation.

   ☐ Yes
   ☐ No

   Comments:

7. Do you believe there are alternatives or more cost-effective options to address the recommendations in CIP-014-4 to address the reliability issue of physical security? If so, please provide your recommendation and, if appropriate, technical, or procedural justification.

   ☐ Yes
   ☐ No

   Comments:

8. Provide any additional comments for the drafting team to consider, if desired.

   Comments:

Standards Announcement

Project 2023-06 CIP-014 Risk Assessment Refinement
CIP-014-4

Be aware that this is a public proceeding, and comments are publicly available upon submission. DO NOT include any CEII or otherwise sensitive information in your comments.

Formal Comment Period Open through May 14, 2026

Now Available

A 45-day formal comment period for draft three of **CIP-014-4 Physical Security**, is open through **8 p.m. Eastern, Thursday, May 14, 2026**.

The drafting team's considerations of the responses received from the previous comment period are reflected in this draft of the standard.

Reminder Regarding Corporate RBB Memberships

Under the NERC Rules of Procedure, each entity and its affiliates is collectively permitted one voting membership per Registered Ballot Body Segment. Each entity that undergoes a change in corporate structure (such as a merger or acquisition) that results in the entity or affiliated entities having more than the one permitted representative in a particular Segment must withdraw the duplicate membership(s) prior to joining new ballot pools or voting on anything as part of an existing ballot pool. Contact ballotadmin@nerc.net to assist with the removal of any duplicate registrations.

Commenting

Use the Standards Balloting and Commenting System (SBS) to submit comments. An unofficial Word version of the comment form is posted on the project page.

- *Contact NERC IT support directly at https://support.nerc.net/ (Monday – Friday, 8 a.m. - 5 p.m. Eastern) for problems regarding accessing the SBS due to a forgotten password, incorrect credential error messages, or system lock-out.*
- *Passwords expire every **6 months** and must be reset.*
- *The SBS **is not** supported for use on mobile devices.*
- *Please be mindful of ballot and comment period closing dates. We ask to **allow at least 48 hours** for NERC support staff to assist with inquiries. Therefore, it is recommended that users try logging into their SBS accounts **prior to the last day** of a comment/ballot period.*

Next Steps

Additional ballots for the standard and Implementation Plan, as well as a non-binding poll of the associated Violation Risk Factors and Violation Severity Levels, will be conducted **May 5 - May 14, 2026**.

For more information on the Standards Development Process, refer to the Standard Processes Manual.

For more information or assistance, please contact **Ben Wu** via email or at **470-542-6882**. Subscribe to this project's observer mailing list by logging into EasyVista using your ERO portal account. Select "Mailing List Requests" at the bottom of the screen, then click "Create Request" under the "Standards Team Lists" section. Specify "Project 2023-06 CIP-014 - Risk Assessment Refinement observer list" in the Description Box.

NOTE: To create an ERO account, go to the ERO Portal and register for a new account.

Comment	

SNPD strongly disagrees with the adoption of a 36-month assessment interval for utilities that have not previously identified any applicable Transmission stations or substations. Reducing the assessment frequency from 60 months to 36 months would increase the study burden and associated costs for these entities, without providing any demonstrated benefit to the reliability of the Bulk Electric System (BES).

SNPD instead proposes retaining the existing 60-month assessment requirement for entities that have not identified applicable assets. This requirement should continue to include Transmission stations and substations that are planned to be placed in service within the next 60 calendar months.

NPCC RSC suggest adding the 3rd paragraph of the technical rationale to R1. “TOs shall review and, if necessary, update the list of applicable Transmission station(s) or Transmission substation(s) per Attachment 1 at least once every 36 calendar months. The list of applicable Transmission station(s) or Transmission substation(s) shall include existing Facilities and Transmission station(s) and Transmission substation(s) planned to be in service within 36 calendar months. The 36 calendar months risk assessment study cycle aligns with the 36 calendar months planned-to-be-in-service date. "Planned to be in-service" should be taken to mean all Transmission station(s) and Transmission substation(s) as modeled in the base cases for the Near-Term Transmission Planning Horizon”.

The draft references facilities “planned to be in service within 36 months,” but does not describe the basis for making that determination. The Technical Rationale ties this concept to facilities included in Near-Term Transmission Planning base cases; however, this connection is not reflected in the standard language. Incorporating this clarification directly into the standard could enhance clarity and promote consistent application of the requirement.

Question for the SDT: Considering the Measure 1 verbiage (“evidence may include, but are not limited to, dated written or electronic documentation of the Transmission station(s) and Transmission substation(s) (existing and those planned to be in service within 36 calendar months) that meet any of the criteria in Attachment 1.”), what action is needed to demonstrate compliance with respect to “identifying” applicable stations, and what notification(s) is needed? Our observation is that the Req #1 verbiage and the Measure 1 verbiage do not align.

Additionally, we observe that the term “applicable” station is introduced in Req# 1 and is used throughout the standard. The term “proximate” station is introduced in Req #2 and is referred to in Reqs 3.3 and 5. Based on this revision to the standard, these are two distinct sets of stations (applicable and proximate). We observe that for a few requirements / sub-requirements, there may be a possible gap or point of confusion as to whether a proximate station needs to meet the requirement / sub-requirement.

As a general comment, we recommend that the specific use of both of these terms be reviewed in fine detail to ensure that there will be no confusion as to whether a requirement pertains to an applicable station, a proximate station, or to both.

The draft references facilities “planned to be in service within 36 months,” but does not describe the basis for making that determination. The Technical Rationale ties this concept to facilities included in Near-Term Transmission Planning base cases; however, this connection is not reflected in the standard language. Incorporating this clarification directly into the standard could enhance clarity and promote consistent application of the requirement.

Hydro-Québec supports the following NPCC RSC comments:

1. NPCC RSC suggest adding the 3rd paragraph of the technical rationale to R1. “TOs shall review and, if necessary, update the list of applicable Transmission station(s) or Transmission substation(s) per Attachment 1 at least once every 36 calendar months. The list of applicable Transmission station(s) or Transmission substation(s) shall include existing Facilities and Transmission station(s) and Transmission substation(s) planned to be in service within 36 calendar months. The 36 calendar months risk assessment study cycle aligns with the 36 calendar months planned-to-be-in-service date. "Planned to be in-service" should be taken to mean all Transmission station(s) and Transmission substation(s) as modeled in the base cases for the Near-Term Transmission Planning Horizon”.

The draft references facilities “planned to be in service within 36 months,” but does not describe the basis for making that determination. The Technical Rationale ties this concept to facilities included in Near-Term Transmission Planning base cases; however, this connection is not reflected in the standard language. Incorporating this clarification directly into the standard could enhance clarity and promote consistent application of the requirement.

2.

Requirement R1: “Each Transmission Owner, at least once every 36 calendar months, shall …”

Requirement R5: “At least once every 36 calendar months, each Transmission Owner shall …”

Suggest re-wording the beginning of Requirement R1 to align with the structure in R5.

BPA agrees with the modifications made for R1. A three-year calendar cycle is easier to follow. However, the new requirement could pose challenges for entities that have not previously identified critical substations, as it reduces the assessment period from 60 to 36 months.

SRP agrees with R1 and the 36-month timeline but would need clarification on any planned station or substation not included in our latest analysis. A trigger-based element that has utilities create a reduced or trimmed-down analysis for compliance purposes for that specific site could be incorporated into the standard.

2. Do you agree with the modifications made in CIP-014-4 with new Requirement R2 to address the issues identified in the SAR? If you do not agree, please provide your recommendation and, if appropriate, technical or procedural justification.

Constantin Chitescu - Ontario Power Generation Inc. - 5

Answer	No
Document Name	

Comment

OPG supports the following NPCC Regional Standards Committee's comments:

"The Technical Rationale is very clear that proximate facilities identified under R2 are only intended to be used for the R5 risk assessment and the R6 third-party verification, and that they are not meant to carry forward into R7–R10.
R2 should clarify that existing or built "applicable Transmission station(s) or Transmission substation(s) identified in Requirement R1" shall be included in the proximity test. Planned substations may not have a fence line to measure against if they are not built yet.
The drafting team should clarify which fence line (property or substation) is the deciding fence line for the proximity rule and do entities have to coordinate with other entities.

Technical Rational for R2: "The Transmission station(s) or Transmission substation(s) identified in Requirement R2 are only intended for use in the Requirement R5 risk assessment and the Requirement R6 third-party verification to properly account for additional equipment that, if also damaged during an event, could lead to loss of additional Facilities. They are not intended to be subject to Requirements R7 through R10. Requirements R7 through R10 are only relevant for the Transmission substation(s) or Transmission substation(s) identified in Requirement R1."
The use of the word "Proximate" seem to intend an estimation and is at the discretion of the entity of what is a close Transmission Substation or Station. Then the requirement states a specific distance and a way to measure that distance. TFIST suggest removing the word "Proximate".
NPCC RSC suggest modifying R2 to read "Transmission station(s) and Transmission substation(s) identified in CIP-002". If the objective is to perform a separate process or analysis to identify applicable assets, then the assessment should occur in CIP-002."

Comment

ITC supports the distance of 1500 feet or 457 meters (the shortest distance, measured substation fence line to substation fence line) selected by the drafting team for proximate Transmission station(s) and Transmission substation(s). However, we are concerned Transmission stations and Transmission substations owned by other entities who CIP-014 may or may not be applicable cannot be compelled to provide the information necessary for entities to comply with CIP-014. Further, while GIS tools can identify stations and substations within the specified proximity, it can be difficult to determine whose station they might be and if they are Transmission station(s) or Transmission substation(s)

ITC suggests narrowing the scope to existing BES Transmission station(s) and BES Transmission substation(s) which are owned by the applicable entity.

As an alternative, ITC suggests a requirement that neighboring TO’s must share the station name and GIS location on the necessary periodic basis to their neighboring TOs.

Comment

SRP disagrees with R2. No voltage thresholds are mentioned for the proximate sites. Proximate sites can be smaller substations that TOs are responsible for, but that currently (or in the future) have no reason to be protected as larger BES sites. Clarification and direction are needed to determine which substations must comply with R2.

From Hydro One's perspective, the DHS–DOJ Bomb Threat Stand-Off Card (and the 457 m distance) isn't something that's formally adopted or standardized across Canadian jurisdictions. While it's a well-known U.S. reference, we'd see some challenges applying a specific, prescribed blast radius here without tying it back to Canadian authorities or local context.

Additionally, Our SMEs' main concern is that locking utilities into a fixed distance feels counter to a risk-based physical security program. Bomb threat scenarios are highly site-specific and defining a single radius could oversimplify things or even conflict with how a utility's threat and risk assessment is structured. In practice, we'd expect credible bomb threats to be evaluated through our existing Physical Security Threat Risk Assessment (PSTRA) process, with controls documented in the Physical Security Plan (PSP) where the risk justifies it.

Because of that, we generally favor language that allows utilities to define and justify their approach using a documented, risk-based process, informed by DHS/DOJ guidance or other relevant competent authorities, depending on jurisdiction.

Isidoro Behar - Long Island Power Authority - 1

Answer	No
Document Name	

Comment

This Draft improves technical linkage between applicable and proximate stations, however it does not fully resolve the ambiguity regarding identification, scope, and compliance applicability. The standard still lacks clarity on:

- What constitutes "identification" under R1
- And whether proximate stations are subject to downstream requirements. The lack of clarity creates potential confusion regarding scope and compliance expectations, particularly when proximate stations are owned by different entities. (Technical Rationale for R2 clarifies that proximate Transmission stations are intended to be used only for R5 risk assessment and R6 third party verification, and are not intended to be subject to R7 through R10). To ensure consistency, recommendation is to incorporate this clarification directly into the requirement language to avoid any differing interpretations.
- We recommend that the drafting team review and standardize the use of "applicable" and "proximate" throughout the standard, and consider including a clear mapping or explanatory guidance indicating how each requirement applies to each category of station.

While the Technical Rationale notes that facilities identified in R2 are only intended for use in R5 & R6 and not in R7-R10. This should be made clear within the standard language itself and not reliant on the use of the supplementary document. The technical rationale for R2 states that the 1500 feet requirement refers to the DHS-DOJ Bomb Threat Stand-off Card as justification for this distance. The Bomb Threat Card reflects personnel evacuation distances rather than infrastructure damage distances. CHPD recommends using damage-based distances supported by historical or technical research. Additionally, the measurement from substation fence line to substation fence line can present some unrealistic distance scenarios for CIP-014 assessments. For instance, a substation may have a large, fenced area with power equipment positioned within the fence perimeter in such a way that distances may exceed 1500 feet from the proposed event blast location to an adjacent or “proximate” facility. It is recommended to modify this language to be less prescriptive with this distance requirement and instead allow utilities to either: -use the provided R2 distance, whether that is the current revision’s 1500 ft requirement or a distance based upon damage distances (preferably one grounded in damage distances)	

OR

-allow utilities to select damage distance thresholds for identifying “proximate” stations based upon provided NERC guidance or DHS/DOJ/CISA resources for a variety of threat types but also require utilities to provide rationale within their CIP-014 methodologies and/or assessments for why they selected the specific distance threshold or excluded “proximate” stations from identification.

CHPD suggests removing the word 'proximate'. It is uncommon standard language, alternatives could be 'near' or 'nearby'.

The new requirement to list any transmission station located within 1,500 ft of a candidate facility acknowledges the risk of multi-station, single-attack scenarios, yet the fixed distance appears arbitrary. To prevent over- or under-inclusion, particularly in dense urban corridors, PG&E recommends that NERC cite the threat analysis that produced the 1,500 ft figure and allow entities to justify an alternative distance where a quantified risk assessment demonstrates equivalent or better coverage. This added clarity will reduce regional interpretation disputes and avoid unnecessary modelling effort.

The requirement also presents substantial implementation challenges related to inter-utility coordination. Assessing the physical security implications of an attack on a neighboring utility's substation, particularly where no joint-ownership or operational agreement is already in place, will necessitate new formal data-sharing protocols and coordination mechanisms. This is likely to produce administrative complexity, delays in risk assessments, and disputes over sensitive information sharing. PG&E urges the NERC DT to provide specific guidance, or a recommended template for inter-utility agreements, to facilitate this critical coordination.

Response

Ronald Hoover - Bonneville Power Administration - 1,3,5,6 - WECC

Answer	No
Document Name	

Comment

BPA Transmission Planning generally agrees with the new Requirement R2 as it clearly defines the shortest distance of applicability for substations in proximity. However, there is concern that this limit might be too short, and a higher range of distance should be considered. Proximity substations owned by other utilities could be within 0.5-2 miles of each other, a distance that could be covered by physical attackers in a short span of time. Transmission Planning recommends using technically-supported damage distances or allowing utilities the flexibility to select and justify their own distances. Additionally, the use of the term "identify" is unclear; it is not obvious whether this requires documentation or ongoing tracking.

Alyssia Rhoads - Public Utility District No. 1 of Snohomish County - 1

Answer	No
Document Name	

Comment

SNPD does not fully support the modifications made in new Requirement R2. SNPD requests clarification regarding which voltage classes are applicable for proximate Transmission stations and Transmission substations. The absence of a defined voltage threshold introduces ambiguity and

may result in the inclusion of facilities that are not relevant from a security perspective. To address this, SNPD recommends that Requirement R2 exclude Transmission stations and substations operating below 200 kV from being considered proximate facilities.

DE agrees with the modifications, but DE has concern that the rationale for 1500ft distance for proximity sites to be considered and applicable threats. The document “CIP-014-4_Technical Rationale Clean_03-031-2026” references the Department of Homeland Security (DHS) – Department of Justice (DOJ) Bomb Threat Stand-Off Card in regard to establishing the 1500ft distance. This reference was developed for establishing evacuation distances for human life safety in the event an explosive is found in a vehicle or other delivery method to allow for first responders to investigate. The impact of an explosive to human life versus substation components or an operations center are not the same. If the intent is to establish proximity site distances based on the “Mandatory Evacuation Distance, this is most closely aligned with the Semi-Trailer threat size which is multiple orders of magnitude higher than the maximum explosive size indicated in the 2026 Electricity Sector Design Basis Threat document from the E-ISAC. This explosive size is also orders of magnitude higher than design basis threat sizes typically utilized with the blast design community, especially within the United States. If the intent is to reference a smaller explosive size in the “Shelter-In-Place or Preferred Evacuation Distance” these are broad ranges and again based on human life safety, not substation component response to a threat size. In summary, the reference document is not appropriate for establishing stand-off distances (proximity distance relative to an explosive) or design basis threat explosive sizes for substations or operations centers. These should be established based on a specific design basis threat applicable to the industry and the response of the substation equipment or the operations center building to that threat size, as is standard practice with the blast design community.

Manitoba Hydro believes that having a clear distance threshold in Requirement R2 will be helpful from a compliance and audit perspective. However, we also believe TOs should have some flexibility to consider additional criteria beyond the 1500 feet hard limit separation distance. The goal is to protect against cascading outages; the strict 1,500-foot threshold may not reflect the actual diverse physical security risks at each site and may ignore surrounding terrain and shielding, including natural barriers.

In the Technical Rationale under R2, the last paragraph, it is recommended that SDT revise the paragraph as follows.

“The Transmission station(s) or Transmission substation(s) identified in Requirement R2 are only intended for use in the Requirement R5 risk assessment and the Requirement R6 third-party verification to properly account for additional BES Facilities that could be lost due to equipment damage that, if also damaged during an event

The ISO/RTO Council (IRC) Standards Review Committee (SRC) recommends that the drafting team acknowledge within the Technical Rationale that the Transmission Owner might be the only entity that has the information needed to determine which Transmission stations or substations are within 1,500 feet or 457 meters of an applicable Transmission station or substation under Requirement R2. Consequently, entities performing unaffiliated third-party verifications under Requirement R6 may not be able to verify that a Transmission Owner has properly identified all Transmission stations or Transmission substations within 1,500 feet or 457 meters of applicable stations or substations identified under Requirement R1. As a result, these unaffiliated third parties may need to rely on data provided by the TO when no other data is available, which could undermine the usefulness of unaffiliated third-party verifications. Note: AESO, ISO-NE, and SPP abstain from these comments.

Comment

The language "A single justification may be used for multiple locations." does not prevent selection of least impactful attack or corresponding less severe Fault at multiple locations which could result in inappropriate Fault applications and may cause compliance as well as physical security gaps.

The physical attack criteria does not require selection of highest severity or most electrically impactful Fault, only a "high-severity physical attack" which leaves room for less severe physical attack selections and thus less impactful and incongruent Fault selections.

Three-phase to ground fault in part was used as a proxy in the past to identify the worst case scenario regardless of the physical attacks. The change in this draft allows Entities to select what may be more likely, but less severe, thus weakening the overall security as locations will be removed from requiring critical protections. The approach of selecting a Fault based on a credible high-severity physical attack increases the likelihood that the Fault could align with physical attacks identified in a Design Basis Threat (DBT) approach (one method to assess threats and risks) that have been observed at similar sites and circumstances, however it reduces the scope of severity of physical attacks that would be considered thus it reduces the scope of Faults that will be considered. This could result in discarding Faults that may occur due to more impactful physical attacks that could occur in the future and thus reduces resiliency to future threat escalations.

The approach of selecting Faults that align with credible high-severity physical attacks will require physical security expertise involvement in the risk assessment process, much earlier than in the current process, and will require closer coordination between physical security expertiese and power system studies expertise. This increases the risk that there is a lack of alignment and consistency of both physical attack selections at like stations and also types of Faults selected by differing Entities which will result in inconsistent applications of physical security measures.

The R3.3.3.1 language could be interpreted to prevent Entities from selecting more impactful or serious Faults since now the Faults need to align with a credible high-severity physical attack instead one that, while not currently likely, could occur in the future. This constraint may cause compliance liability while also potentially reducing physical security posture.

The above assessment by MRO related to R3.3.3 is perceived as a significant enough reduction of effectiveness to motivate voting negative for this draft.

1. The phrases “unacceptable generation and load loss” in R3 Part 3.1 and “actual or more conservative clearing times” in R3 Part 3.3.5 are inherently subjective and open to regional interpretation. To promote uniform implementation, PG&E recommends that the NERC DT establish quantitative default benchmarks for generation and load loss thresholds, together with a clearing-time margin. Including such reference values—while still allowing entities to justify alternative criteria based on system characteristics—will align CIP-014-4 with the measurable approach used in the TPL standards and reduce the potential for inconsistent compliance findings across regions.

2. R3 Part 3.3.1.1 directs that simulations at the applicable station assume prior loss of communication and Protection Systems but does not specify the scope of that loss—whether all communication channels and all Protection System functions at the station are presumed lost, or whether the entity may model a subset based on the attack scenario justified under R3 Part 3.3.3. Defining the expected modelling approach, preferably with an example one-line diagram and timing table in the Technical Rationale, will allow entities to apply the requirement consistently and give verifiers and auditors a clear baseline for compliance testing.

3. Two clearing-time provisions in R3 Part 3.3 appear to direct different outcomes. R3 Part 3.3.1.3 requires delayed (remote) clearing at the applicable station unless otherwise technically substantiated, while R3 Part 3.3.5 requires actual or more conservative clearing times to be used. The relationship between the two is unclear and will likely produce inconsistent practice across entities. PG&E recommends that the NERC DT consolidate these provisions into a single clearing-time requirement that establishes a clear hierarchy among delayed/remote clearing, actual clearing times, and any shorter alternative supported by technical substantiation. A unified provision will support consistent simulation practice and reduce the potential for differing interpretations across regions.

4. The term “credible high-severity physical attack” in R3 Part 3.3.3 is central to the Fault-justification record but is not defined in CIP-014-4 or in the NERC Glossary. Without a shared reference, entities are likely to identify different attack scenarios and verifiers to apply different standards during their review. PG&E recommends that the NERC DT reference an established threat framework or at a minimum identify in the Technical Rationale the broad categories of attack the drafting team has in mind. Providing this anchor will support consistent Fault selection across entities and reduce interpretive disputes.

There on concerns with the modification of R3.3 in this draft revision. The description is problematic as it first assumes a high-severity physical attack is credible, then is unclear what ‘high severity' refers to, whether the severity of the attack refers to the damage to station equipment, or to the scale of grid-impact. CHPD recommends clarification or re-writing to clarify what is meant by ‘high severity’. Additionally, the requirement language is unclear if the same type of fault must be applied to the other stations within 1500’ even if that would result in a scenario that is not credible or likely. Technical rationale for R3.1 states that the damage to nearby stations is “assumed to be collateral damage” but this is an assumption that does not have a technical justified basis as it relies upon The Bomb Threat Stand-off Card (from CIP-014 Technical Rationale for R2) which describes evacuation distances for threat types, not technically justified studies or research of expected damage thresholds for various threats. The standard also does not mention common definitions of threat types or guidance of which threats to assess. If all threat types are available to be studied but there are no common event definitions, then the standard will rely upon events definitions in entities documented methodologies, which may vary widely in scope and interpretation. R3.3.2 technical rationale refers to allowing other fault types but still relies upon entities’ methodologies to describe the specific applicable threat(s), which could lead to inconsistencies in threat descriptions and/or significant increases to workload burden for the utility, 3rd party reviewers, and auditors. R3.3.4 requires “Removal of all Elements that Protection Systems and other controls are expected to automatically disconnect” but as written there is not a CIP-014 requirement to coordinate with neighbors, so how would a given entity know which protection systems and controls are expected to automatically disconnect at neighboring facilities without coordination? Also, the current language does not account for the possibility that the nearby station may not be electrically connected to the station under study in any meaningful capacity. R3.3.5 mentions ‘actual’ clearing times. Actual times would denote from an actual attack - in simulation, the best most utilities can study are expected times, unless of course that entity had an actual attack (a rare situation). CHPD recommends changing the term 'actual' to 'expected'. Lastly, as noted in the comments for R2 above, the use of the term 'proximate' is unusual and infrequently used in common language. CHPD would recommend changing this term to 'near' or 'nearby'.

Oshara Narangoda - Oshara Narangoda On Behalf of: Aditya Menon, Hydro One Networks, Inc., 1; - Oshara Narangoda	
Answer	No
Document Name	
Comment	
Hydro One is concerned that Requirement R2 and R3 assigns implicit accountability to Transmission Owners (TOs) for conducting or substantiating simulations involving proximate BES facilities owned and operated by other entities, over which the TO has no authority, operational control, or guaranteed data access. **Example:**	

Where a Generator Owner (GO) BES station is adjacent to a CIP-014 identified Transmission station, the Transmission Owner cannot compel participation in modeling or analysis from the GO. As written, Requirement R3 does not clearly define:

- Who is responsible for performing such simulations
- Which entity is accountable for audit evidence
- How compliance is achieved when the adjacent facility is outside the TO's control

These challenges are further exacerbated in cross-jurisdictional scenarios (e.g., Manitoba, New York, Michigan), where regulatory authority, planning roles, and data-sharing constraints differ.

Hydro One believes interconnection-level modeling of cascading, instability, and uncontrolled separation is more appropriately the responsibility of the **Reliability Coordinator (RC) and/or the Planning Coordinator (PC) / Transmission Planner (TP)** or should require an explicit transfer of responsibility from the Transmission Owner to these entities.

Absent clarification, Requirement R3 exposes TOs to compliance risk for activities they cannot directly perform or control.

General

Like other NERC standards, the use of **"past qualified studies"** should be allowed. Recommend writing this into the standard.

R3.2

The dynamic simulation test is performed first. Only stations or substations that meet the criteria in the dynamic simulation are then evaluated using the steady state simulation to determine CIP-014 applicability.

Propose the rewrite as follows:

"The dynamic simulation test is done first. For those stations or substations which pass criteria in the dynamic simulation test, the steady-state simulation test is to be used to determine CIP-14 applicability status."

R3.3.3

Requirement R3.3.3 calls for a documented justification of the credible high-severity physical attack and associated fault(s) to be simulated. Can you clarify the expected level of detail for this documentation, particularly with respect to what would be considered sufficient to meet auditor expectations for the R3 VSLs? Additionally, is the intent of R3.3.3 limited strictly to the selection of fault conditions, or are recovery considerations (e.g., restoration assumptions, reconfiguration capability, or time to recovery) expected to be included as part of the justification?"

Timothy Singh - Timothy Singh On Behalf of: Israel Perez, Salt River Project, 6, 3, 5, 1; Jennifer Bennett, Salt River Project, 6, 3, 5, 1; Laura Somak, Salt River Project, 6, 3, 5, 1; Matthew Jaramilla, Salt River Project, 6, 3, 5, 1; - Timothy Singh

Answer	No
Document Name	

Comment

SRP would like further clarification and specific guidance for R3. There is no mention of the type of threat or severity considered. Also no mention of whether both stations are disabled by a single event (bomb) or by multiple events in the same proximate area (shooter(s) or similar). This could lead to

different utilities running completely different analyses on the proximate sites. Clarification is also needed to determine which entity is responsible for implementing R3. Although there are situations in which different utilities share or are proximate to each other, there may be an issue with the responsibility for sites brought in within the new 1500 ft perimeter. There is also clarification needed on whether a 3-phase bolted fault or a single-line-to-ground fault is required for the analysis.

Nathan Browder - Nathan Browder On Behalf of: Matt Lewis, Lower Colorado River Authority, 1, 5; - Nathan Browder

Answer	No
Document Name	

Comment

No. We do not agree with the proposed modifications specifically in section 3.3.3. The added language could lead to inconsistent interpretation of what constitutes a “credible” physical attack scenario and the amount of justification needed for a fault. LCRA believes that how a substation is taken out of service matters less than the result of a substation outage. Irrespective of the cause of the outage, the result is the substation is out of service. The proposed language appears to require entities to first develop physical attack scenarios before performing the study, which feels like doing a threat assessment twice.

For 3.1 ITC requests removal of requirement for technically justified thresholds and instead require only documented criteria for unacceptable generation and load loss within an interconnection.

ITC recommends removal of 3.3.1.1 and 3.3.1.2 as a prior loss of communication and protection systems and then an application of a fault or faults isn't a realistic sequence. ITC believes 3.3.1.3 by itself sufficiently describes the intended scenario of using delayed (remote) clearing times unless otherwise technically substantiated.

WAPA objects to the addition of "technically justified" to R3.1. WAPA suggests removing "technically justified". If that is not acceptable, WAPA requests that the requirement be a documented rationale instead. The term "technically justified" is concerning. Who determines whether a threshold is "technically justified" for unacceptable generation and load loss within an entire Interconnection? The following suggested change is provided if simply striking "technically justified" isn't acceptable:

R3.1 Documented criteria for assessing instability, uncontrolled separation, or Cascading within an Interconnection. The criteria shall include, at a minimum, thresholds identifying unacceptable generation and load loss within an Interconnection. The rationale for these thresholds shall be available as supporting information.

This aligns with a similar statement made in TPL-001-5.1 regarding supporting rationale.

The Technical Rational Document provides added context. However, the RF team believes in order to address existing issues and the intent of the Standard, more clarity is needed in R3. R3.1 of the Requirement does not call out Steady State or Dynamic studies, while the Technical Rational lists parameters that can be used to evaluate the steady-state and/or dynamic analysis. It is recommended that the thresholds be identified for both Steady State and Dynamic, not and/or. It is recommended that this language should be in the Requirement, not just the Technical Rationale. For R3.3 (3.3.2.1/3.3.3.2) it requires a TO to provide what simulations were run, whereas, the RF team believes a TO's methodology should also include technical justification for which Fault or Faults were run. It is recommended that this language should be in the Requirement, not just the Technical Rationale.

BPA Transmission Planning supports new Requirement R3, noting its alignment with our current risk assessment methodology and its value in detailing minimum risk assessment requirements for all Transmission Owners. However, we find the generation or load loss criteria regarding specific MW thresholds unclear. NERC should consider adding a net loss criterion or establishing quantitative default benchmarks. Additionally, "Fault" should be specified as a 3-phase Fault, as it is typically the most severe.

Jodi Yeary - AEP - 3	
Answer	Yes
Document Name	

Comment
AEP notices that requirement R3.3 may be unclear and open-ended, creating potential audit risk, specifically regarding the definitions of “credible” or “high severity,” which may be subject to inconsistent interpretations and deemed insufficient in an audit context. AEP will develop a justification document around our interpretation of these terms, but recognize that it may be subjective in nature AEP requests clarification around what constitutes “credible” and “high severity” scenarios in the Technical Rationale, while avoiding excessive scenario detail that could serve as a roadmap for malicious actors. AEP also requests clarification around the inclusion of the word *“prior”* from Part 3.3.1.1. The requirement should associate the loss of communications directly with the attack scenario being simulated, rather than requiring a prior loss associated with some undefined earlier scenario. Fault clearing times should be derived from the nature of the simulated scenario, associated fault, and the specific protection scheme applied to each Element at an applicable station. If the acceptable scenarios are to involve loss of communication, that should be explicitly stated. Loss of communication clearing times may be normal or delayed depending on the type of protection system applied to an Element.

Exelon agrees with the modifications made to Requirement R3. Exelon also supports the EEI suggested edit to the Technical Rationale as stated below:

EEI proposes the following language modification to the final sentence of the Technical Rationale for Requirement R3, Part 3.3.1 that is more aligned with the language in Requirement R3 Subsection R3.3.1.3.

“The use of delayed clearing times, **unless otherwise technically substantiated,** is necessary because the applicable substation has lost local protection and all communications with other substations.”

Deleting the phrase "typically Zone 2" from the sentence above.

Chantal Mazza - Chantal Mazza On Behalf of: Junji Yamaguchi, Hydro-Quebec (HQ), 1, 5; Nicolas Turcotte, Hydro-Quebec (HQ), 1, 5; - Chantal Mazza	
Answer	
Document Name	
Comment	

Hydro-Québec supports the following NPCC RSC comments: Please see previous comment that was submitted by NPCC RSC. NPCC RSC believes that only the Transmission Planner (TP) is able to answer R3 and not the TO.

Furthermore, in HQ's view, the technical efforts and resources required to develop the list of critical facilities in accordance with Requirement R3 are significant and are notcost-effectively justifiable when undertaken solely to satisfy the objectives of CIP-014.

As we have previously highlighted, system performance assessments that aim at determining critical elements of a system can only be conducted by an entity that possesses the knowledge of the behavior of the system as whole and can certainly not be performed by a TO alone. As such, the TP and/or PC are the best suited functional entities to determine the critical elements of the power system under their responsibility or jurisdiction. If, for any reason, an explicit transfer of responsibility from the TO to the TP and/or PC is not considered feasible, then the current resulting implicit transfer of burden from the TO to the TP and PC should, at a minimum, be formally acknowledged in writing in the standard. Hydro-Québec agrees that The TP and/or PC, should be required to provide a comprehensive methodology and uniform approach in determining the proper level of contingency applied to the system in their jurisdiction order to determine the CIP-014 applicable facilities list. However, the TP and/or PC **should be allowed to rely on technically qualifying past or related studies** for the purpose of establishing the resulting facilities identified for applicability. Hydro-Québec's vote in favor of this revision is dependent on this flexibility being explicitly stated as such in the standard.

Joshua London - Eversource Energy - 1, Group Name Eversource

Answer	
Document Name	

Comment

The requirement to document criteria identifying unacceptable generation and load loss "within an Interconnection" is unclear and open to interpretation. It is not clear whether this refers to entities that operate across multiple Interconnections, or whether it requires entities to define thresholds based on impacts to an entire Interconnection. If the latter, this could be interpreted as requiring individual TOs to assess or define Interconnection wide impact criteria, which is beyond their visibility and responsibility. To avoid inconsistent interpretation the drafting team should clarify the intent. If the requirement is meant to address impacts that can be assessed by the entity, the phrase "within an Interconnection" should be completely removed or revised to define the scope more precisely. If the intent is to assess Interconnection wide impacts, the DT should provide a maximum threshold of unacceptable generation and load loss so all TOs are aligned in implementation.

Kirsten Rowley - Midcontinent ISO, Inc. - 2, Group Name ISO/RTO Council (IRC) Standards Review Committee (SRC)

Answer	
Document Name	

Comment

Similar to the comment provided in response to Question 2, third-party verifications performed under Requirement R6 may not be sufficient to verify the communications proposed under Requirement R3 (specifically R3.3.1.1 regarding prior loss of communication and Protection Systems). Because unaffiliated third parties conducting R6 verifications must rely on the Transmission Owner to supply the necessary information, the intended checks and balances of the review are diminished. At best, information may be collected, but independently verifiable evidence may not be accessible. The IRC SRC recommends that the drafting team acknowledge this limitation in verifiability within the Technical Rationale.

Note: AESO, ISO-NE, and SPP abstain from these comments.

Rachel Coyne - Texas Reliability Entity, Inc. - 10

Answer	
Document Name	

Comment

Texas RE recommends the following revisions (in bold):

- 3.1 "…The criteria shall include, at a minimum, technically justified thresholds identifying generation and load loss **that could cause instability, uncontrolled separation, or cascading** within the interconnection." This specifies that unacceptable generation and load loss is loss that could cause instability, uncontrolled separation, or cascading effects.
- 3.2 – revise "System peak Load case" to "System **on-Peak** Load case" to ensure consistency with the NERC-defined term.
- 3.3.3.1 "Prior loss of communication **or** Protection Systems, **or both**;" This captures the loss of one or both of these components.

Gail Elliott - Gail Elliott On Behalf of: Michael Moltane, International Transmission Company Holdings Corporation, 1; - Gail Elliott

Answer	No
Document Name	

Comment

ITC suggests the removal of or the following revision to Requirement R4:

R4. Each Transmission Owner with applicable Transmission station(s) and Transmission substation(s) identified in Requirement R1 containing Bulk Electric System (BES) Elements greater than 200 kV or identified as part of an IROL or essential to meeting an NPIR owned by multiple Transmission Owners shall coordinate with each appropriate Transmission Owner(s) to determine and document their individual and joint responsibilities for documenting a risk assessment methodology under Requirement R3 and for performing any required risk assessments per Requirement R5.

R4 is administrative requiring documentation for all joint stations. Many joint stations have existed for decades where the two entities have an understanding of who is responsible for what parts of compliance. When documentation is being required, many entities legal groups will feel a need to be involved making this both time consuming and costly.

Answer	No
Document Name	

Comment

SRP disagrees with R4 and that Transmission Owners should be held accountable for submitting their respective documentation for their substations. The coordination effort may be difficult depending on the methodologies and scenarios, and it could affect the outcomes. R4 could also create a compliance risk, as utilities may be held responsible for the inaction or unresponsiveness of other utilities.

Comment	
NYPA supports the comments submitted by NPCC RSC. In addition, NYPA recommends adding the term “existing” to the R4 requirement language on the jointly owned substation. This clarification would limit the scope to “existing” jointly owned facility. Including future jointly owned substations could introduce practical challenges and lead to ambiguity in implementation.

Comment	
To clarify responsibilities related to jointy owned facilities, we recommend the modification below: Suggested Modification in bold text: **R4.** *Each Transmission Owner with applicable Transmission station(s) and Transmission substation(s) identified in Requirement R1 jointly owned by multiple Transmission Owners shall coordinate with each appropriate Transmission Owner(s) to determine and document their individual and joint responsibilities under* ***Requirement R2****, Requirement R3, and Requirement R5.*	

It doesn't serve any purpose for the joint owner not responsible for performing the analysis to also have to identify proximate subs to the joint facility. It should be part of the individual and joint responsibilities agreement under R4 as to who will do the proximate locating for the joint facility.

Comment

The current R4 language brings adjacent-stations considerations into the requirement without establishing any corresponding obligation for neighboring entities to participate. This creates uncertainty around how coordination is expected to occur and places entities in a position where their compliance may depend on the cooperation or responsiveness of others.

BPA Transmission Planning supports the new Requirement R4, recognizing its value in promoting collaborative assessments of joint substations using a shared methodology. However, the current wording poses considerable coordination challenges and presumes a degree of inter-entity collaboration, scheduling, and methodological consistency that may be impractical. Furthermore, it creates a compliance risk for individual entities, making them reliant on the actions and responsiveness of others.

Req #4 specifically addresses facilities (BES Elements) with joint ownership to coordinate/collaborate. One improvement would be to include Transmission Owners whose stations have been identified as part of Req #2 to also be included in this requirement to coordinate. The ownership of the applicable and proximate stations may be different, and thus we feel the concept of coordination with respect to Req #2 should apply.

5. Do you agree with the modifications made in CIP-014-4 with adding Requirement R5 to address the issues identified in the SAR? If you do not agree, please provide your recommendation and, if appropriate, technical or procedural justification.

Alyssia Rhoads - Public Utility District No. 1 of Snohomish County - 1

Answer	No
Document Name	

Comment

SNPD strongly disagrees with adopting a 36-month risk assessment interval for utilities that have not previously identified any Transmission stations or substations as critical. This change would increase study costs without providing a meaningful improvement to the reliability of the Bulk Electric System (BES).

Instead, SNPD recommends retaining the existing 60-month assessment interval for Transmission Owners (TOs) that have not identified any applicable critical facilities. This approach should continue to include Transmission stations and substations that are planned to be placed in service within the next 60 calendar months.

For these utilities, reducing the assessment interval from 60 months to 36 months would result in unnecessary cost increases due to more frequent studies. Given their historical results, these additional assessments are unlikely to identify any new facilities that would qualify as CIP-014 critical beyond those already identified under CIP-014-3. As such, the proposed change offers little to no reliability benefit to the BES.

R5. Clarify if at the end of the 36-month period the entity must have the Risk Assessment started or completed? TFIST suggest splitting the operational assessment and security assessment into distinct assessments in the timeline to reduce confusion and not just referred to as the “risk assessment”.

In the last sentence of R5, “they should also be included in the risk assessment” TFIST questions if this makes the proximate Transmission station(s) and Transmission substation(s) optional in the risk assessment?

Comment	

NYPA believes it would be better to clarify the 36-calendar month requirement in R5 applies at the initiation or at the completion of the risk assessment. As currently written, the requirement could be interpreted either way, which may lead to inconsistent implementation and would help clarify confusion especially during the transition to the new standard.

NYPA believes the SDT may consider separating the operational assessment and security assessment into distinct assessments within the timeline, rather than collectively referring them as “risk assessment” to further improve clarity and reduce ambiguity”

Please clarify whether, at the end of the 36-month period, the entity is required to have initiated or completed the Risk Assessment. We recommend separating the operational assessment and security assessment into distinct components within the timeline to reduce confusion, rather than referring to both collectively as the “risk assessment.”

SRP sees the need for better oversight, or at least better clarification of the responsible entity. Clarity of accountability is needed, as the proximate substation TO may not know they need to be in compliance with the standard.

For 5.1, failure to perform the entirety of the risk assessment could have an TO not completing either the stability or steady state portion of the study. If the third party reviewer identified a mistake in the piece of the study that was completed, they have nothing to verify for the second half of the study as it was not performed. Changes to the system which add resiliency to the system may have changed a previous critical station to a non-critical station. Not studying it going forward means that the costs would continue to be incurred for protecting a station that does not require it.

ITC recommends removing 5.2 as this is not language conducive to a standard requirement.

The NSRF notes that the purpose statement in the standard was revised from "could **cause** instability" to "could **result in** instability." This change was reflected in R5, but parts R5.1, R5.2, and R5.3 still have the previous wording "as causing instability" instead of "resulting in instability." This change is recommended for consistency. The NSRF believes this to be a non-substantive change.

There is no issue with performing a risk assessment every 36 months. However, Transmission Owners are not the appropriate registered entity to conduct planning analyses. Nor are the CIP standards the appropriate place to document planning analysis requirements. Planning studies should be governed within the TPL group of standards.

Recommend clarifying R5.3. As written, it is unclear whether the requirement applies only to the applicable entity's control center or also to a neighboring entity's control center that could contribute to instability, uncontrolled separation, or Cascading. If neighboring facilities must be identified, there is a risk they may not be notified, as no requirement currently exists to inform adjacent entities of their inclusion in a CIP-014 assessment. Clearer language would help ensure consistent expectations and appropriate coordination.

For the Implementation Plan section on Initial Performance of Periodic Requirements, BPA is concerned about the potential for having to re-do work under V3 and then shortly thereafter have to do similar work to comply with V4. This is a concern when there are many sites to put through the cycle. BPA requests that the implementation plan instead use the approach found in FAC-014-3: shall be implemented by the [Registered Entity] following the effective date of [the standard] when it begins its next cycle for conducting the studies [required by the standard].

BPA also seeks clarification on R5.2 concerning critical stations identified in prior risk assessments.

Additional Assessments and Duration: What specifically constitutes "additional assessments," and for what duration can these be forgone?

Trigger for New Risk Assessment: Does the Transmission Owner unilaterally determine when a new risk assessment is necessary, especially given that R5.3 and R7-R10 still apply "until a new risk assessment demonstrates otherwise"?

Texas RE noticed that the requirement language does not quite clarify how the terms inoperable and damaged should be reflected in the risk assessment as noted on page 4 of the SAR. It appears the SDT may be trying to address this in Requirement Part 3.1. The SDT could consider revising requirement part 3.1 to the following, which includes recommended changes in response to question #3 (in bold).

3.1 Documented criteria for assessing instability, uncontrolled separation, or Cascading within an Interconnection. The criteria shall include, at a minimum, the following:

3.1.1 technically justified thresholds identifying generation and load loss **that could cause instability, uncontrolled separation, or cascading** within the interconnection;

3.1.2 **Clarification of the terms "inoperable" and "damaged" as used in the risk assessment.**

6. Do you agree with the Implementation Plan for CIP-014-4? If you think an alternate timeframe is needed, please propose an alternate implementation plan with a detailed explanation.

Gail Elliott - Gail Elliott On Behalf of: Michael Moltane, International Transmission Company Holdings Corporation, 1; - Gail Elliott

Answer	No
Document Name	

Comment

ITC believes there could be issues with identifying all of the proximity stations soon enough to identify their configurations and clearing times soon enough to perform all of the required studies. This is more of an issue as entities add facilities in additional states. The number of coordination agreements could also cause an issue in obtaining all of the required documentation.

ITC recommends allowing 36 months for the implementation of the plan as several of the new proposed requirements will take significant time to prepare for prior to running the studies.

Comment

Texas RE is concerned the implementation plan has a disconnect between the effective date and initial performance dates of Requirements R1 and R5. Texas RE also requests guidance on how this implementation plan works with the existing 36-month intervals for Requirements R1 and R5.

Texas RE notes that Requirement R1, which defines the process for identifying applicable Transmission stations or substations for use required risk assessments, does not specify an initial performance date. Absent an initial performance date, it is arguable that entities are not required to perform the first identification activities described in Requirement R1 until 36 calendar months following the effective date (that is, the interval period outlined in the specific requirement). However, the draft Implementation Plan states that the initial performance of the risk assessment activities required by the proposed Requirement R5 should occur by the effective date of the standard.

Importantly, however, those risk assessment activities in Requirement R5 explicitly contemplate using the station or substations identified through the Requirement R1 process. Per the language in the proposed Requirement R5, “each Transmission Owner shall perform a risk to identify applicable Transmission station(s) or Transmission substation(s) **identified in Requirement R1**” that if rendered inoperable would result in instability, uncontrolled separation, or cascading (emphasis added). Texas RE is concerned given the explicit expectation that entities perform at least some form of Requirement R1 identification activities prior to the risk assessment activities described in Requirement R5 that registered entities may be confused as the appropriate order of performance. For instance, one possible reading is that entities may use a current list of facilities for the initial performance of the new Requirement R5 risk assessment. Other registered entities may read the Requirement R1 identification process as subsumed with the Requirement R5 risk assessment and perform all those steps prior to the effective and initial performance date. In order to avoid potential inconsistent applications of the proposed standard language, Texas RE recommends that the SDT clarify whether the expectation is for a new Requirement R1

station and substation identification process should be performed in support of the initial performance of the proposed Requirement R5 risk assessment process or if the previously existing Requirement R1 stations and substations may be used.

Texas RE also inquires as to how this implementation plan considers that currently-registered applicable entities are required to this work under CIP-014-3. Does the timeline for Requirement R1 and Requirement R5 start over once CIP-014-4 is approved? Texas RE requests the drafting team provide guidance on the relationship between current activities and the implementation plan for CIP-014-4.

Lastly, Texas RE recommends the drafting team reference the practice guide regarding use of the term “calendar months.”

Comment	

Exelon agrees with the Implementation Plan, however the EEI comments highlight a concern that some entities my be required to complete assessments for CIP-014-3 and CIP-014-4 in the same timeframe.

Exelon supports the clarifications suggested in the EEI comments included below:

A Transmission Owner may perform a risk assessment consistent with CIP-014-4 at any time following approval of CIP-014-4 by the appropriate regulatory authority. Where such an assessment is completed during the implementation period and prior to the effective date of CIP-014-4, that assessment shall be deemed acceptable for purposes of satisfying any then-applicable periodic risk assessment due date under CIP-014-3.

If a Transmission Owner completes a risk assessment consistent with CIP-014-4 prior to the effective date of CIP-014-4, and that assessment is completed within the Transmission Owner's then-applicable CIP-014-3 periodic risk assessment interval, the assessment shall satisfy the periodic risk assessment obligation in CIP-014-3 Requirement R1.

No additional or separate CIP-014-3 risk assessment is required to meet the CIP-014-3 periodic due date in this circumstance.

The completion date of a CIP-014-4 risk assessment used to satisfy a CIP-014-3 periodic requirement shall establish the start date for the applicable entity's next periodic risk assessment interval under CIP-014-4.

A CIP-014-4 risk assessment completed during the implementation period and used to satisfy a CIP-014-3 periodic due date shall remain valid following the retirement of CIP-014-3.

EEI agrees with the Implementation Plan but proposes the following language to provide clarity regarding the performance of CIP-014 Assessments prior to the effective date of CIP-014-4. **A Transmission Owner may perform a physical security risk assessment consistent with CIP-014-4 at any time following approval of CIP-014-4 by the appropriate regulatory authority. Where such an assessment is completed during the implementation period and prior to the effective date of CIP-014-4, that assessment shall be deemed acceptable for purposes of satisfying any then-applicable periodic physical security risk assessment due date under CIP-014-3.** **If a Transmission Owner completes a physical security risk assessment consistent with CIP-014-4 prior to the effective date of CIP-014-4, and that assessment is completed within the Transmission Owner's then-applicable CIP-014-3 periodic risk assessment interval, the assessment shall satisfy the periodic risk assessment obligation in CIP-014-3 Requirement R1.** **No additional or separate CIP-014-3 risk assessment is required to meet the CIP-014-3 periodic due date in this circumstance.**	

The completion date of a CIP-014-4 risk assessment used to satisfy a CIP-014-3 periodic requirement shall establish the start date for the applicable entity's next periodic physical security risk assessment interval under CIP-014-4.

A CIP-014-4 risk assessment completed during the implementation period and used to satisfy a CIP-014-3 periodic due date shall remain valid following the retirement of CIP-014-3.

TXNM Energy agrees with EEI submitted comments repeated below.

EEI agrees with the Implementation Plan but proposes the following language to provide clarity regarding the performance of CIP-014 Assessments prior to the effective date of CIP-014-4.

A Transmission Owner may perform a physical security risk assessment consistent with CIP-014-4 at any time following approval of CIP-014-4 by the appropriate regulatory authority. Where such an assessment is completed during the implementation period and prior to the effective date of CIP-014-4, that assessment shall be deemed acceptable for purposes of satisfying any then-applicable periodic physical security risk assessment due date under CIP-014-3.

If a Transmission Owner completes a physical security risk assessment consistent with CIP-014-4 prior to the effective date of CIP-014-4, and that assessment is completed within the Transmission Owner's then-applicable CIP-014-3 periodic risk assessment interval, the assessment shall satisfy the periodic risk assessment obligation in CIP-014-3 Requirement R1.

No additional or separate CIP-014-3 risk assessment is required to meet the CIP-014-3 periodic due date in this circumstance.

The completion date of a CIP-014-4 risk assessment used to satisfy a CIP-014-3 periodic requirement shall establish the start date for the applicable entity's next periodic physical security risk assessment interval under CIP-014-4.

A CIP-014-4 risk assessment completed during the implementation period and used to satisfy a CIP-014-3 periodic due date shall remain valid following the retirement of CIP-014-3.

SNPD recognizes the increased financial burden associated with performing risk assessments every 36 months, rather than every 60 months, for Transmission Owners that have not identified any applicable Transmission stations or substations. This burden is further amplified by the requirement to have each assessment verified by an unaffiliated third party at the same increased frequency. SNPD believes there are more cost-effective alternatives to address the physical security reliability objectives of CIP-014-4. Specifically, SNPD recommends maintaining a risk-based, performance-oriented approach by retaining the existing 60-month assessment interval for Transmission Owners that have not previously identified any applicable facilities. For these entities, historical assessments have demonstrated a low likelihood of identifying critical assets, and increasing the frequency does not provide a commensurate reliability benefit. Additionally, SNPD recommends that enhanced requirements, such as performing risk assessments every 36 months and requiring third-party verification, be applied only to entities that have previously identified critical Transmission stations or substations, or where system changes indicate a higher risk profile. This targeted, risk-based approach would better align regulatory requirements with actual system risk and improve overall cost-effectiveness. SNPD also supports continued inclusion of planned Transmission stations and substations expected to be placed in service within the assessment window, ensuring that future system changes are appropriately evaluated without imposing unnecessary burdens on entities with consistently low-risk profiles. Overall, a tiered, risk-informed framework would more effectively balance reliability objectives with cost considerations, while avoiding unnecessary regulatory and financial impacts on entities unlikely to identify CIP-014 critical facilities.

Currently, CIP-014 requires Transmission Owners to conduct planning analyses, and then have these analyses reviewed by a third party verifier. Requirement 6.1 states the the third party verifier must be a registered Planning Coordinator, Transmission Planner, Reliability Coordinator, or have transmission planning or analysis experience. Therefore, instead of a planning entity performing the study, the TO must pay a third party to verify the assessment and now at a higher frequency (36 month vs 60 month).

The current standard treats physical security measures as the default solution and does not clearly allow for system-level mitigations. In many cases, lower cost options could be available. Take a system issue for example that leads to instability could instead be resolved by changing relay settings to be more sensitive when normally redundant communication is lost, this would lead to an inexpensive solution to fix the problem, whereas a physical barrier such as a fence does not address the risk exposure of the lines leaving the station. It is strongly recommended that the standard includes some sort of concept where utilities could alternately identify solutions, as confirmed by the 3rd party, in lieu of directly going to the physical security step. As	

written, the standard does not prohibit system-level solutions, but it also does not acknowledge them or present them as viable alternatives to physical security measures. This lack of clarity limits the opportunity to pursue effective, lower-cost fixes that directly address the underlying issue.

More technical guidance from NERC on damage distances for a variety of bomb threat types is recommended and modifying the distance requirement in R2 to be based upon damage thresholds rather than personnel evacuation mandates. Additionally in R2, allowing utilities the flexibility to provide rationale in their CIP-014 assessments for why any identified proximate stations within the provided distance should be excluded or if any different distances are used would lead to more realistic physical security scenarios being assessed and reduce the cost-burden of assessing scenarios that are beyond reasonable damage distances.

Similar to TPL-001-5.1 Requirement 2.6, we recommend that the SDT consider, and if applicable, outline under which specific circumstances past studies/results can be utilized for the CIP-014-4 risk assessment.

The possible use of past studies may reduce workload of entities and support a more cost effective option to address CIP-014-4 needs.

There needs to be much more clarification regarding the issue raised in the comments. The Standard has changed a lot since the last iteration but so have threats and the means to mitigate them. If the Standard considered some of the ideas and clarifications brought up by SRP and others, it would be for the betterment of the industry.

The requirement for documentation for joint station is not cost effective. Requiring all entities to provide this documentation for historic stations is an administrative burden. This requirement should only be applicable to those entities who failed to perform a risk assessment for a joint station. The requirement to include proximity stations owned by other entities puts unreasonable requirements on the TO as other entities may not willingly provide, and may not be bound by CIP-14 to provide, documentation for those stations. In addition, it places unreasonable burden on the TO to field visit and identify proximity stations prior to studies each cycle. ITC suggests narrowing the scope to existing BES Transmission station(s) and BES	

Transmission substation(s) which are owned by the applicable entity, or including a requirement that neighboring entities are required to provide station names and GIS locations.

OPG supports the following NPCC Regional Standards Committee's comments: "CIP-014-4 standard: 1. R2: add BES acronym to first instance of the use of Bulk Electric System and replace with BES throughout the rest of the standard. 2. When referring to "control center" throughout the standard, are we referring to the NERC Glossary term "Control Center"? If so, please consider capitalizing the term throughout the standard. 3. R5 High VSL: refers to Part 5.2 however the primary control center is identified in Part 5.3. Technical Rationale: 1. Replace references to CIP-002-5.1 for CIP-002-5.1a throughout the document. 2. Replace the reference to EOP-004-2 on page 18 with EOP-004-4. 3. The Technical Rationale for CIP-014 Requirement R3, Part 3.3.3 should include a statement that the use of three-phase faults at applicable stations constitutes an acceptable approach. The concern raised is that the requirement language "[a] documented justification for the Fault(s) associated with physical attack to be simulated" could be interpreted as requiring the Transmission Owner to perform an (in-depth/detailed) analysis of potential credible high-severity scenario for a physical attack even if a (generally worst-case) three-phase fault is the selected Fault type."

It’s Seminole’s understanding that NERC has instated an Abeyance Program for certain Reliability Standards. It’s unclear to Seminole that if a Standard is not identified in the abeyance program as to whether then it should be treated as a zero defect Standard, and therefore, Seminole requests that this Standard be entered formally into the NERC Abeyance Program. If not put into the NERC Abeyance Program, Seminole requests that the NERC Standard Drafting Team identify that this Standard should not be treated as a zero-defect Standard.

Comment
The primary issue with this standard as it is written, and as this draft continues is the application of requirements/expectations appropriate for the Transmission Planner/Planning Coordinator function to the Transmission Owner instead. Developing steady-state and dynamic simulation criteria is a planning function and should not be required of a Transmission Owner. The sub-requirements (of R3) go further into addressing what a transmission planning study should include but applies this requirement incorrectly to the Transmission owner. The intent of R3 is more appropriately applicable to the TPL body of standards. More appropriately, CIP-014 should reference output from a study performed in accordance with a clearly defined TPL requirement for an extreme event involving the loss of an applicable Transmission station(s) or substation(s). This reduces clarity on the types of studies to be performed to assess the extreme events identified in this standard. The revisions may follow the scope of the SAR but this fundamental flaw is still an issue. Regarding R6: With an attempt at clarifying study criteria, though they should be applied to the appropriate planning entity, there is no reason to maintain a requirement for an unaffiliated third party to perform a verification of a transmission planning analysis associated with the risk assessment. Instead of requiring planning entities be the third party verifier, they should just perform the study under clearly defined requirements in a TPL standard and communicate

this information to the Transmission Owner. It is also important to note the third party verifying the risk assessment for this physical security standard is not required to have expertise in that area according to this requirement. Additionally, the SDT should consider removing the Reliability Coordinator as a potential third party verifier as that function does not perform the type of analysis being sought in this standard.

Additional Comment:

The analysis outlined in the CIP-014 standard is an evaluation of an extreme event and is based on transmission planning analysis. It would seem NERC and the industry are potentially missing an opportunity to consolidate requirements around the evaluation of extreme events better than what is currently provided for in the current construct of the existing and planned Reliability Standards. Consideration should be given to provide a better pathway to house long-term planning requirements around extreme event analysis within the TPL standards (not CIP) and specify the reliability analyses needed, the parameters for determining reliability, expectations for corrective actions, and the communication path from planning to owners and others with a reliability-related need for this information. The planning assessment/CAP required by TPL-001 is already required to be distributed to applicable owners. Clarifying the extreme event expectations in TPL-001 (or other planning standard) to specify that evaluating the substation outage outlined in CIP-014 every 36 months is one pathway to better align standard requirements with the appropriate entity.

Comment

AEP recommends adding a Moderate VSL for R2 as follows (change indicated in ***bold***):

Moderate VSL: “The Transmission Owner with applicable Transmission station(s) or Transmission substation(s) identified in Requirement R1 ***failed to identify one*** existing Bulk Electric System Transmission station(s) and Bulk Electric System Transmission substation(s), irrespective of ownership, within 1500 feet or 457 meters (the shortest distance, measured substation fence line to substation fence line) of an applicable Transmission station or Transmission substation identified in Requirement R1.”

AEP also recommends adding clarification to the Severe VSL for R2 (change indicated in ***bold***):

Severe VSL: “The Transmission Owner with applicable Transmission station(s) or Transmission substation(s) identified in Requirement R1 ***failed to identify any*** existing Bulk Electric System Transmission station(s) and Bulk Electric System Transmission substation(s), irrespective of ownership, within 1500 feet or 457 meters (the shortest distance, measured substation fence line to substation fence line) of an applicable Transmission station or Transmission substation identified in Requirement R1.”

Finally, AEP recommends removing the phrase “any evidence for” from the Severe VSL for R4 to correct a typographical error. The revised language would read (remove **italisized*)*:

“…for more than 75% and less than or equal to 100% of ****any evidence for of**** jointly owned applicable Transmission station(s) and Transmission substation(s).”

CIP-014-4 standard:

1. R2: add BES acronym to first instance of the use of Bulk Electric System and replace with BES throughout the rest of the standard.
2. When referring to “control center” throughout the standard, are we referring to the NERC Glossary term “Control Center”? If so, please consider capitalizing the term throughout the standard.
3. R5 High VSL: refers to Part 5.2 however the primary control center is identified in Part 5.3.

Technical Rationale:

1. Replace references to CIP-002-5.1 for CIP-002-5.1a throughout the document.
2. Replace the reference to EOP-004-2 on page 18 with EOP-004-4.
3. The Technical Rationale for CIP-014 Requirement R3, Part 3.3.3 should include a statement that the use of three-phase faults at applicable stations constitutes an acceptable approach. The concern raised is that the requirement language “[a] documented justification for the Fault(s) associated with physical attack to be simulated” could be interpreted as requiring the Transmission Owner to perform an (in-depth/detailed) analysis of potential credible high-severity scenario for a physical attack even if a (generally worst-case) three-phase fault is the selected Fault type.

Kirsten Rowley - Midcontinent ISO, Inc. - 2, Group Name ISO/RTO Council (IRC) Standards Review Committee (SRC)

Answer	
Document Name	

Comment

The IRC SRC notes that Criterion 3 in Attachment 1 references Facilities identified by the Planning Coordinator as critical to the derivation of an Interconnection Reliability Operating Limit (IROL). However, under FAC-014-3, Planning Coordinators no longer develop IROLs. The SRC recommends that Criterion 3 be updated accordingly to remove the reference to the Planning Coordinator.

The IRC SRC also recommends a new SAR could be developed to remove Requirement R6 from the proposed CIP-014-4 standard. The new requirements proposed in CIP-014-4 Requirements R1-R5 outline necessary specifics for more meaningful risk assessments, which reduces the need for unaffiliated third-party verification, especially given that auditors are also directed to apply various methods to test the validity of station identifications under current CIP-014-3 Requirement R1.

Note: AESO, ISO-NE, and SPP abstain from these comments.

Understanding that R6, formerly R2 under CIP-014-3, is out of scope for this SAR, MRO NSRF requests that the drafting team make a recommendation to the Standards Committee based on industry feedback that a SAR be drafted to remove R6 as an administrative burden. It should no longer be needed, given that this project has added the necessary specifics required for a meaningful risk assessment, diminishing the need for third-party verification. Also, there has been anecdotal experience as an industry that auditors have audited the (CIP-014-3) R1 risk assessments directly without relying on the R2 third-party verification as directed by the RSAW. If (CIP-014-4) R6 is to be retained, 90 calendar days for completing R6 in R6.2 is proving to be tight for some larger entities, which request extension to 180 calendar days (which would be much easier to calculate as six calendar months to avoid getting tripped up on 28/30/31-day months). The MRO NSRF requests that the requirement R10 for a third-party review of the physical security plan be considered for removal as part of the same SAR, this requirement similarly adds administrative burden without benefit to the BES.

There were 69 sets of responses, including comments from approximately 150 different people from approximately 95 companies representing 8 of the Industry Segments as shown in the table on the following pages.

All comments submitted can be reviewed in their original format on the project page.

If you feel that your comment has been overlooked, let us know immediately. Our goal is to give every comment serious consideration in this process. If you feel there has been an error or omission, contact Manager of Standards Information, Nasheema Santos (via email) or at (404) 290-6796.

Questions

1. Do you agree with the modifications made in CIP-014-4 with modified Requirement R1 to address the issues identified in the standard authorization request (SAR)? If you do not agree, please provide your recommendation and, if appropriate, technical or procedural justification.

2. Do you agree with the modifications made in CIP-014-4 with new Requirement R2 to address the issues identified in the SAR? If you do not agree, please provide your recommendation and, if appropriate, technical or procedural justification.

3. Do you agree with the modifications made in CIP-014-4 with new Requirement R3 to address the issues identified in the SAR? If you do not agree, please provide your recommendation and, if appropriate, technical or procedural justification.

4. Do you agree with the modifications made in CIP-014-4 with new Requirement R4 to address the issues identified in the SAR? If you do not agree, please provide your recommendation and, if appropriate, technical or procedural justification.

5. Do you agree with the modifications made in CIP-014-4 with adding Requirement R5 to address the issues identified in the SAR? If you do not agree, please provide your recommendation and, if appropriate, technical or procedural justification.

6. Do you agree with the Implementation Plan for CIP-014-4? If you think an alternate timeframe is needed, please propose an alternate implementation plan with a detailed explanation.

7. Do you believe there are alternatives or more cost-effective options to address the recommendations in CIP-014-4 to address the reliability issue of physical security? If so, please provide your recommendation and, if appropriate, technical, or procedural justification.

8. Provide any additional comments for the drafting team to consider, if desired.

1. Do you agree with the modifications made in CIP-014-4 with modified Requirement R1 to address the issues identified in the standard authorization request (SAR)? If you do not agree, please provide your recommendation and, if appropriate, technical or procedural justification.
Alyssia Rhoads - Public Utility District No. 1 of Snohomish County - 1

Answer	No
Document Name	

Comment

SNPD strongly disagrees with the adoption of a 36-month assessment interval for utilities that have not previously identified any applicable Transmission stations or substations. Reducing the assessment frequency from 60 months to 36 months would increase the study burden and associated costs for these entities, without providing any demonstrated benefit to the reliability of the Bulk Electric System (BES).

SNPD instead proposes retaining the existing 60-month assessment requirement for entities that have not identified applicable assets. This requirement should continue to include Transmission stations and substations that are planned to be placed in service within the next 60 calendar months.

Response

Thank you for your comments. A directive of the SAR was to “correct any discrepancies between the study period, frequency of study, and the base case(s) a Transmission Owner uses.” The Drafting Team chose a timeframe that balanced the directive of the SAR and the comments from industry to make the timeframe either shorter or longer than 36 months.

Comment	
NPCC RSC suggest adding the 3rd paragraph of the technical rationale to R1. “TOs shall review and, if necessary, update the list of applicable Transmission station(s) or Transmission substation(s) per Attachment 1 at least once every 36 calendar months. The list of applicable Transmission station(s) or Transmission substation(s) shall include existing Facilities and Transmission station(s) and Transmission substation(s) planned to be in service within 36 calendar months. The 36 calendar months risk assessment study cycle aligns with the 36 calendar months planned-to-be-in-service date. "Planned to be in-service" should be taken to mean all Transmission station(s) and Transmission substation(s) as modeled in the base cases for the Near-Term Transmission Planning Horizon”. The draft references facilities “planned to be in service within 36 months,” but does not describe the basis for making that determination. The Technical Rationale ties this concept to facilities included in Near-Term Transmission Planning base cases; however, this connection is not reflected in the standard language. Incorporating this clarification directly into the standard could enhance clarity and promote consistent application of the requirement.

Response	
Thank you for your comments. The Drafting Team believes Requirement R1 clearly establishes the obligation to identify existing Transmission stations and Transmission substations, as well as those planned to be in service within 36 calendar months. Technical Rationale provides supporting explanation regarding the 36-calendar-month alignment and the use of planning information to support consistent implementation. The Drafting Team believes this clarification is appropriately addressed in the Technical Rationale and has determined that additional revisions to Requirement R1 are not needed.

Question for the SDT: Considering the Measure 1 verbiage (“evidence may include, but are not limited to, dated written or electronic documentation of the Transmission station(s) and Transmission substation(s) (existing and those planned to be in service within 36 calendar months) that meet any of the criteria in Attachment 1.”), what action is needed to demonstrate compliance with respect to “identifying” applicable stations, and what notification(s) is needed? Our observation is that the Req #1 verbiage and the Measure 1 verbiage do not align.

Additionally, we observe that the term “applicable” station is introduced in Req# 1 and is used throughout the standard. The term “proximate” station is introduced in Req #2 and is referred to in Reqs 3.3 and 5. Based on this revision to the standard, these are two distinct sets of stations (applicable and proximate). We observe that for a few requirements / sub-requirements, there may be a possible gap or point of confusion as to whether a proximate station needs to meet the requirement / sub-requirement.

As a general comment, we recommend that the specific use of both of these terms be reviewed in fine detail to ensure that there will be no confusion as to whether a requirement pertains to an applicable station, a proximate station, or to both.

The draft references facilities “planned to be in service within 36 months,” but does not describe the basis for making that determination. The Technical Rationale ties this concept to facilities included in Near-Term Transmission Planning base cases; however, this connection is not reflected in the standard language. Incorporating this clarification directly into the standard could enhance clarity and promote consistent application of the requirement.

Response

Thank you for your comment. The drafting team looked the measure over and believes that the verbiage is clear.

From the SAR work scopes (Revise the risk assessment and clarify how to account for adjacent Transmission stations or Transmission substations of differing ownership as well as for those Transmission stations or Transmission substations within line-of-sight to each other.), neighboring BES stations must be considered. Requirement R3, Parts R3.3.2 and R3.4, as well as Requirement R5 spelled out what exactly applicable entities should do for proximate stations. The drafting team made some modifications in Requirement R2 to clear some confusion.

The Drafting Team believes Requirement R1 clearly establishes the obligation to identify existing Transmission stations and Transmission substations, as well as those planned to be in service within 36 calendar months. Technical Rationale provides supporting explanation regarding the 36-calendar-month alignment and the use of planning information to support consistent implementation. The Drafting Team believes this clarification is appropriately addressed in the Technical Rationale and has determined that additional revisions to Requirement R1 are not needed.

Hydro-Québec supports the following NPCC RSC comments:

1. NPCC RSC suggest adding the 3rd paragraph of the technical rationale to R1. “TOs shall review and, if necessary, update the list of applicable Transmission station(s) or Transmission substation(s) per Attachment 1 at least once every 36 calendar months. The list of applicable Transmission station(s) or Transmission substation(s) shall include existing Facilities and Transmission station(s) and Transmission substation(s) planned to be in service within 36 calendar months. The 36 calendar months risk assessment study cycle aligns with the 36 calendar months planned-to-be-in-service date. "Planned to be in-service" should be taken to mean all Transmission station(s) and Transmission substation(s) as modeled in the base cases for the Near-Term Transmission Planning Horizon”.

The draft references facilities “planned to be in service within 36 months,” but does not describe the basis for making that determination. The Technical Rationale ties this concept to facilities included in Near-Term Transmission Planning base cases; however, this connection is not reflected in the standard language. Incorporating this clarification directly into the standard could enhance clarity and promote consistent application of the requirement.

2.

Requirement R1: “Each Transmission Owner, at least once every 36 calendar months, shall …”

Requirement R5: “At least once every 36 calendar months, each Transmission Owner shall …” Suggest re-wording the beginning of Requirement R1 to align with the structure in R5.

BPA agrees with the modifications made for R1. A three-year calendar cycle is easier to follow. However, the new requirement could pose challenges for entities that have not previously identified critical substations, as it reduces the assessment period from 60 to 36 months.

SRP agrees with R1 and the 36-month timeline but would need clarification on any planned station or substation not included in our latest analysis. A trigger-based element that has utilities create a reduced or trimmed-down analysis for compliance purposes for that specific site could be incorporated into the standard.	
Likes 0	
Dislikes 0	

Response	
Thank you for your comments and support. Transmission Owners are expected to use the best available information at the time of the assessment. The Drafting Team does not believe a separate trigger-based requirement is necessary.

OPG supports the following NPCC Regional Standards Committee's comments:

"The Technical Rationale is very clear that proximate facilities identified under R2 are only intended to be used for the R5 risk assessment and the R6 third-party verification, and that they are not meant to carry forward into R7–R10. R2 should clarify that existing or built "applicable Transmission station(s) or Transmission substation(s) identified in Requirement R1" shall be included in the proximity test. Planned substations may not have a fence line to measure against if they are not built yet. The drafting team should clarify which fence line (property or substation) is the deciding fence line for the proximity rule and do entities have to coordinate with other entities.

Technical Rational for R2: "The Transmission station(s) or Transmission substation(s) identified in Requirement R2 are only intended for use in the Requirement R5 risk assessment and the Requirement R6 third-party verification to properly account for additional equipment that, if also damaged during an event, could lead to loss of additional Facilities. They are not intended to be subject to Requirements R7 through R10. Requirements R7 through R10 are only relevant for the Transmission substation(s) or Transmission substation(s) identified in Requirement R1."
The use of the word "Proximate" seem to intend an estimation and is at the discretion of the entity of what is a close Transmission Substation or Station. Then the requirement states a specific distance and a way to measure that distance. TFIST suggest removing the word "Proximate".
NPCC RSC suggest modifying R2 to read "Transmission station(s) and Transmission substation(s) identified in CIP-002". If the objective is to perform a separate process or analysis to identify applicable assets, then the assessment should occur in CIP-002."

ITC supports the distance of 1500 feet or 457 meters (the shortest distance, measured substation fence line to substation fence line) selected by the drafting team for proximate Transmission station(s) and Transmission substation(s). However, we are concerned Transmission stations and Transmission substations owned by other entities who CIP-014 may or may not be applicable cannot be compelled to provide the information necessary for entities to comply with CIP-014. Further, while GIS tools can identify stations and substations within the specified proximity, it can be difficult to determine whose station they might be and if they are Transmission station(s) or Transmission substation(s) ITC suggests narrowing the scope to existing BES Transmission station(s) and BES Transmission substation(s) which are owned by the applicable entity. As an alternative, ITC suggests a requirement that neighboring TO's must share the station name and GIS location on the necessary periodic basis to their neighboring TOs.

SRP disagrees with R2. No voltage thresholds are mentioned for the proximate sites. Proximate sites can be smaller substations that TOs are responsible for, but that currently (or in the future) have no reason to be protected as larger BES sites. Clarification and direction are needed to determine which substations must comply with R2.

From Hydro One's perspective, the DHS–DOJ Bomb Threat Stand-Off Card (and the 457 m distance) isn't something that's formally adopted or standardized across Canadian jurisdictions. While it's a well-known U.S. reference, we'd see some challenges applying a specific, prescribed blast radius here without tying it back to Canadian authorities or local context.

Additionally, Our SMEs' main concern is that locking utilities into a fixed distance feels counter to a risk-based physical security program. Bomb threat scenarios are highly site-specific and defining a single radius could oversimplify things or even conflict with how a utility's threat and risk assessment is structured. In practice, we'd expect credible bomb threats to be evaluated through our existing Physical Security Threat Risk Assessment (PSTRA) process, with controls documented in the Physical Security Plan (PSP) where the risk justifies it.

Because of that, we generally favor language that allows utilities to define and justify their approach using a documented, risk-based process, informed by DHS/DOJ guidance or other relevant competent authorities, depending on jurisdiction.

This Draft improves technical linkage between applicable and proximate stations, however it does not fully resolve the ambiguity regarding identification, scope, and compliance applicability. The standard still lacks clarity on: • What constitutes "identification" under R1 • And whether proximate stations are subject to downstream requirements. The lack of clarity creates potential confusion regarding scope and compliance expectations, particularly when proximate stations are owned by different entities. (Technical Rationale for R2 clarifies that proximate Transmission stations are intended to be used only for R5 risk assessment and R6 third party verification, and are not intended to be subject to R7 through R10). To ensure consistency, recommendation is to incorporate this clarification directly into the requirement language to avoid any differing interpretations. • We recommend that the drafting team review and standardize the use of "applicable" and "proximate" throughout the standard, and consider including a clear mapping or explanatory guidance indicating how each requirement applies to each category of station.

While the Technical Rationale notes that facilities identified in R2 are only intended for use in R5 & R6 and not in R7-R10. This should be made clear within the standard language itself and not reliant on the use of the supplementary document.	

The technical rationale for R2 states that the 1500 feet requirement refers to the DHS-DOJ Bomb Threat Stand-off Card as justification for this distance. The Bomb Threat Card reflects personnel evacuation distances rather than infrastructure damage distances. CHPD recommends using damage-based distances supported by historical or technical research. Additionally, the measurement from substation fence line to substation fence line can present some unrealistic distance scenarios for CIP-014 assessments. For instance, a substation may have a large, fenced area with power equipment positioned within the fence perimeter in such a way that distances may exceed 1500 feet from the proposed event blast location to an adjacent or “proximate” facility. It is recommended to modify this language to be less prescriptive with this distance requirement and instead allow utilities to either: -use the provided R2 distance, whether that is the current revision’s 1500 ft requirement or a distance based upon damage distances (preferably one grounded in damage distances) OR -allow utilities to select damage distance thresholds for identifying “proximate” stations based upon provided NERC guidance or DHS/DOJ/CISA resources for a variety of threat types but also require utilities to provide rationale within their CIP-014 methodologies and/or assessments for why they selected the specific distance threshold or excluded “proximate” stations from identification. CHPD suggests removing the word 'proximate'. It is uncommon standard language, alternatives could be 'near' or 'nearby'.

Comment
The new requirement to list any transmission station located within 1,500 ft of a candidate facility acknowledges the risk of multi-station, single-attack scenarios, yet the fixed distance appears arbitrary. To prevent over- or under-inclusion, particularly in dense urban corridors, PG&E recommends that NERC cite the threat analysis that produced the 1,500 ft figure and allow entities to justify an alternative distance where a quantified risk assessment demonstrates equivalent or better coverage. This added clarity will reduce regional interpretation disputes and avoid unnecessary modelling effort. The requirement also presents substantial implementation challenges related to inter-utility coordination. Assessing the physical security implications of an attack on a neighboring utility's substation, particularly where no joint-ownership or operational agreement is already in place, will necessitate new formal data-sharing protocols and coordination mechanisms. This is likely to produce administrative complexity, delays in risk assessments, and disputes over sensitive information sharing. PG&E urges the NERC DT to provide specific guidance, or a recommended template for inter-utility agreements, to facilitate this critical coordination.

Comment
BPA Transmission Planning generally agrees with the new Requirement R2 as it clearly defines the shortest distance of applicability for substations in proximity. However, there is concern that this limit might be too short, and a higher range of distance should be considered. Proximity substations owned by other utilities could be within 0.5-2 miles of each other, a distance that could be covered by physical attackers in a short span of time. Transmission Planning recommends using technically-supported damage distances or allowing utilities the flexibility to select and justify their own distances. Additionally, the use of the term "identify" is unclear; it is not obvious whether this requires documentation or ongoing tracking.

SNPD does not fully support the modifications made in new Requirement R2. SNPD requests clarification regarding which voltage classes are applicable for proximate Transmission stations and Transmission substations. The absence of a defined voltage threshold introduces ambiguity and may result in the inclusion of facilities that are not relevant from a security perspective. To address this, SNPD recommends that Requirement R2 exclude Transmission stations and substations operating below 200 kV from being considered proximate facilities.

DE agrees with the modifications, but DE has concern that the rationale for 1500ft distance for proximity sites to be considered and applicable threats. The document “CIP-014-4_Technical Rationale Clean_03-031-2026” references the Department of Homeland Security (DHS) – Department of Justice (DOJ) Bomb Threat Stand-Off Card in regard to establishing the 1500ft distance. This reference was developed for establishing evacuation distances for human life safety in the event an explosive is found in a vehicle or other delivery method to allow for first responders to investigate. The impact of an explosive to human life versus substation components or an operations center are not the same. If the intent is to establish proximity site distances based on the “Mandatory Evacuation Distance, this is most closely aligned with the Semi-Trailer threat size which is multiple orders of magnitude higher than the maximum explosive size indicated in the 2026 Electricity Sector Design Basis Threat document from the E-ISAC. This explosive size is also orders of magnitude higher than design basis threat sizes typically utilized with the blast design community, especially within the United States. If the intent is to reference a smaller explosive size in the “Shelter-In-Place or Preferred Evacuation Distance” these are broad ranges and again based on human life safety, not substation component response to a threat size. In summary, the reference document is not appropriate for establishing stand-off distances (proximity distance relative to an explosive) or design basis threat explosive sizes for substations or operations centers. These should be established based on a specific design basis threat applicable to the industry and the response of the substation equipment or the operations center building to that threat size, as is standard practice with the blast design community.

Manitoba Hydro believes that having a clear distance threshold in Requirement R2 will be helpful from a compliance and audit perspective. However, we also believe TOs should have some flexibility to consider additional criteria beyond the 1500 feet hard limit separation distance. The goal is to protect against cascading outages; the strict 1,500-foot threshold may not reflect the actual diverse physical security risks at each site and may ignore surrounding terrain and shielding, including natural barriers. In the Technical Rationale under R2, the last paragraph, it is recommended that SDT revise the paragraph as follows. “The Transmission station(s) or Transmission substation(s) identified in Requirement R2 are only intended for use in the Requirement R5 risk assessment and the Requirement R6 third-party verification to properly account for additional BES Facilities that could be lost due to equipment damage that, if also damaged during an event

Answer	
Document Name	
Comment	

The ISO/RTO Council (IRC) Standards Review Committee (SRC) recommends that the drafting team acknowledge within the Technical Rationale that the Transmission Owner might be the only entity that has the information needed to determine which Transmission stations or substations are within 1,500 feet or 457 meters of an applicable Transmission station or substation under Requirement R2. Consequently, entities performing unaffiliated third-party verifications under Requirement R6 may not be able to verify that a Transmission Owner has properly identified all Transmission stations or Transmission substations within 1,500 feet or 457 meters of applicable stations or substations identified under Requirement R1. As a result, these unaffiliated third parties may need to rely on data provided by the TO when no other data is available, which could undermine the usefulness of unaffiliated third-party verifications. Note: AESO, ISO-NE, and SPP abstain from these comments.

Response
Thank you for your comments. The DT attempted to accommodate earlier requests for a specific distance and sought to reference published, publicly available documents. Accordingly, the DHS-DOJ Bomb Threat Standoff Card was selected. This document provides technically supported damage distances based on various scenarios.

Response	
Thank you for your comments. If no justification is required, then thresholds will become arbitrary and perhaps even subject to manipulation to influence the risk assessments.	
Tasha Ward - Midwest Reliability Organization - 10	
Answer	No
Document Name	
Comment	
The language "A single justification may be used for multiple locations." does not prevent selection of least impactful attack or corresponding less severe Fault at multiple locations which could result in inappropriate Fault applications and may cause compliance as well as physical security gaps. The physical attack criteria does not require selection of highest severity or most electrically impactful Fault, only a "high-severity physical attack" which leaves room for less severe physical attack selections and thus less impactful and incongruent Fault selections. Three-phase to ground fault in part was used as a proxy in the past to identify the worst case scenario regardless of the physical attacks. The change in this draft allows Entities to select what may be more likely, but less severe, thus weakening the overall security as locations will be removed from requiring critical protections. The approach of selecting a Fault based on a credible high-severity physical attack	

increases the likelihood that the Fault could align with physical attacks identified in a Design Basis Threat (DBT) approach (one method to assess threats and risks) that have been observed at similar sites and circumstances, however it reduces the scope of severity of physical attacks that would be considered thus it reduces the scope of Faults that will be considered. This could result in discarding Faults that may occur due to more impactful physical attacks that could occur in the future and thus reduces resiliency to future threat escalations. The approach of selecting Faults that align with credible high-severity physical attacks will require physical security expertise involvement in the risk assessment process, much earlier than in the current process, and will require closer coordination between physical security expertise and power system studies expertise. This increases the risk that there is a lack of alignment and consistency of both physical attack selections at like stations and also types of Faults selected by differing Entities which will result in inconsistent applications of physical security measures. The R3.3.3.1 language could be interpreted to prevent Entities from selecting more impactful or serious Faults since now the Faults need to align with a credible high-severity physical attack instead one that, while not currently likely, could occur in the future. This constraint may cause compliance liability while also potentially reducing physical security posture. The above assessment by MRO related to R3.3.3 is perceived as a significant enough reduction of effectiveness to motivate voting negative for this draft.

Response	
Thank you for your comments. The standard cannot reasonably be written to mandate the worst possible event. The DT recognized that physical attack scenarios of the highest severity could be conceived of that would be devasting and even well beyond affecting an Interconnection, but such scenarios would not be credible. The DT feels that the phrase “credible high-severity physical attack” effectively and reasonably manages this issue such that entities should feel compelled to run something that is high in electrical severity but still rooted in reality. Furthermore, the DT feels that requiring a documented justification for the type of Fault(s) simulated prevents any entity from simply adopting the least impactful scenario.

1. The phrases “unacceptable generation and load loss” in R3 Part 3.1 and “actual or more conservative clearing times” in R3 Part 3.3.5 are inherently subjective and open to regional interpretation. To promote uniform implementation, PG&E recommends that the NERC DT establish quantitative default benchmarks for generation and load loss thresholds, together with a clearing-time margin. Including such reference values—while still allowing entities to justify alternative criteria based on system characteristics—will align CIP-014-4 with the measurable approach used in the TPL standards and reduce the potential for inconsistent compliance findings across regions.

2. R3 Part 3.3.1.1 directs that simulations at the applicable station assume prior loss of communication and Protection Systems but does not specify the scope of that loss—whether all communication channels and all Protection System functions at the station are presumed lost, or whether the entity may model a subset based on the attack scenario justified under R3 Part 3.3.3. Defining the expected modelling approach, preferably with an example one-line diagram and timing table in the Technical Rationale, will allow entities to apply the requirement consistently and give verifiers and auditors a clear baseline for compliance testing.

3. Two clearing-time provisions in R3 Part 3.3 appear to direct different outcomes. R3 Part 3.3.1.3 requires delayed (remote) clearing at the applicable station unless otherwise technically substantiated, while R3 Part 3.3.5 requires actual or more conservative clearing times to be used. The relationship between the two is unclear and will likely produce inconsistent practice across entities. PG&E recommends that the NERC DT consolidate these provisions into a single clearing-time requirement that establishes a clear hierarchy among delayed/remote clearing, actual clearing times, and any shorter alternative supported by technical substantiation. A unified provision will support consistent simulation practice and reduce the potential for differing interpretations across regions.

4. The term “credible high-severity physical attack” in R3 Part 3.3.3 is central to the Fault-justification record but is not defined in CIP-014-4 or in the NERC Glossary. Without a shared reference, entities are likely to identify different attack scenarios and verifiers to apply different standards during their review. PG&E recommends that the NERC DT reference an established threat framework or at a minimum identify in the Technical Rationale the broad categories of attack the drafting team has in mind. Providing this anchor will support consistent Fault selection across entities and reduce interpretive disputes.

Response

Thank you for your comments. The DT worked extensively on the thresholds issue, and ultimately determined that leaving specific threshold number determination to the discretion of the entities, while also requiring justification, struck the right balance. Furthermore, the DT does not find the phrase “prior loss of communication and Protection Systems” to be ambiguous as to scope. Regarding clearing time descriptions, the DT believes the wording in R3 Part 3.3.1.3 and R3 Part 3.3.5 essentially describes the same thing. See previous response on “credible high-severity physical attack”.

Comment	
There on concerns with the modification of R3.3 in this draft revision. The description is problematic as it first assumes a high-severity physical attack is credible, then is unclear what 'high severity' refers to, whether the severity of the attack refers to the damage to station equipment, or to the scale of grid-impact. CHPD recommends clarification or re-writing to clarify what is meant by 'high severity'. Additionally, the requirement language is unclear if the same type of fault must be applied to the other stations within 1500' even if that would result in a scenario that is not credible or likely. Technical rationale for R3.1 states that the damage to nearby stations is "assumed to be collateral damage" but this is an assumption that does not have a technical justified basis as it relies upon The Bomb Threat Stand-off Card (from CIP-014 Technical Rationale for R2) which describes evacuation distances for threat types, not technically justified studies or research of expected damage thresholds for various threats. The standard also does not mention common definitions of threat types or guidance of which threats to assess. If all threat types are available to be studied but there are no common event definitions, then the standard will rely upon events definitions in entities documented methodologies, which may vary widely in scope and interpretation.	

R3.3.2 technical rationale refers to allowing other fault types but still relies upon entities' methodologies to describe the specific applicable threat(s), which could lead to inconsistencies in threat descriptions and/or significant increases to workload burden for the utility, 3rd party reviewers, and auditors. R3.3.4 requires "Removal of all Elements that Protection Systems and other controls are expected to automatically disconnect" but as written there is not a CIP-014 requirement to coordinate with neighbors, so how would a given entity know which protection systems and controls are expected to automatically disconnect at neighboring facilities without coordination? Also, the current language does not account for the possibility that the nearby station may not be electrically connected to the station under study in any meaningful capacity. R3.3.5 mentions 'actual' clearing times. Actual times would denote from an actual attack - in simulation, the best most utilities can study are expected times, unless of course that entity had an actual attack (a rare situation). CHPD recommends changing the term 'actual' to 'expected'. Lastly, as noted in the comments for R2 above, the use of the term 'proximate' is unusual and infrequently used in common language. CHPD would recommend changing this term to 'near' or 'nearby'.

The DT feels that the phrase "credible high-severity physical attack" effectively and reasonably manages this issue such that entities should feel compelled to run something that is high in electrical severity but still rooted in reality. Furthermore, the DT feels that requiring a documented justification for the type of Fault(s) simulated prevents any entity from simply adopting the least impactful scenario. The elements that are expected to be removed in R3.3.4 are those local to the affected transmission station or transmission substation, not the neighboring substation. The use of the phrase "actual or more conservative clearing times is intended to address your concern about R3.3.5. The "expected" clearing times should always be longer, i.e., more conservative, than the actual clearing times seen by the equipment.

SDG&E objects to the inclusion of thresholds in R3.1 “the criteria shall include, at a minimum, technically justified thresholds identifying unacceptable generation and load loss within an interconnection. We suggest striking it out altogether & allow TOs to document how they assess instability as they see fit for their own systems.	
Likes 0	
Dislikes 0	
Response	
Thank you for your comments. CIP-014 is intended to address interconnection instability, so events should be evaluated regarding how they impact the interconnection as a whole instead of a single Transmission Owner.	
Randy Peters - Manitoba Hydro - 1,3,5,6 - MRO	
Answer	No
Document Name	
Comment	
MH believes the requirement to develop a documented justification for the physical attack to be simulated in accordance with new sub-requirement R3.3.3 is not technically justifiable and is not cost-effective. MH recommends removing sub-requirement R3.3.3 from the revised standard.	
Likes 0	
Dislikes 0	
Response	
Thank you for your comments. The specification of the Fault type was a matter of extensive discussions within the drafting team, industry observers, the Regional Entities, and NERC. Allowing the individual TOs the flexibility to determine the Fault to study and provide a documented justification for the Fault type(s) to be simulated was mutually agreed upon by the aforementioned parties as preferable to explicitly mandating that every TO apply three-phase Faults in their simulations.

Answer	No

Document Name	
Comment	

Hydro One is concerned that Requirement R2 and R3 assigns implicit accountability to Transmission Owners (TOs) for conducting or substantiating simulations involving proximate BES facilities owned and operated by other entities, over which the TO has no authority, operational control, or guaranteed data access.

Example:

Where a Generator Owner (GO) BES station is adjacent to a CIP-014 identified Transmission station, the Transmission Owner cannot compel participation in modeling or analysis from the GO. As written, Requirement R3 does not clearly define:

- Who is responsible for performing such simulations
- Which entity is accountable for audit evidence
- How compliance is achieved when the adjacent facility is outside the TO's control

These challenges are further exacerbated in cross-jurisdictional scenarios (e.g., Manitoba, New York, Michigan), where regulatory authority, planning roles, and data-sharing constraints differ.

Hydro One believes interconnection-level modeling of cascading, instability, and uncontrolled separation is more appropriately the responsibility of the **Reliability Coordinator (RC) and/or the Planning Coordinator (PC) / Transmission Planner (TP)** or should require an explicit transfer of responsibility from the Transmission Owner to these entities.

Absent clarification, Requirement R3 exposes TOs to compliance risk for activities they cannot directly perform or control.

General

Like other NERC standards, the use of **"past qualified studies"** should be allowed. Recommend writing this into the standard.

R3.2

The dynamic simulation test is performed first. Only stations or substations that meet the criteria in the dynamic simulation are then evaluated using the steady state simulation to determine CIP-014 applicability.

Propose the rewrite as follows:

"The dynamic simulation test is done first. For those stations or substations which pass criteria in the dynamic simulation test, the steady-state simulation test is to be used to determine CIP-14 applicability status." **R3.3.3** Requirement R3.3.3 calls for a documented justification of the credible high-severity physical attack and associated fault(s) to be simulated. Can you clarify the expected level of detail for this documentation, particularly with respect to what would be considered sufficient to meet auditor expectations for the R3 VSLs? Additionally, is the intent of R3.3.3 limited strictly to the selection of fault conditions, or are recovery considerations (e.g., restoration assumptions, reconfiguration capability, or time to recovery) expected to be included as part of the justification?"

Dislikes 0	

Response
Thank you for your comments. The SAR did not allow for the drafting team to add additional responsible entities such as TPs and PCs. A new SAR will be required for this change. If a risk assessment identifies a transmission station or transmission substation as causing instability, uncontrolled separation, or Cascading within an Interconnection when rendered inoperable or damaged, then the TO can chose to forego future assessments for that substation, provided Requirements R7 through R10 continued to be adhered to. The TO has the choice of which order in which to perform the dynamic and steady-state simulations.

SRP would like further clarification and specific guidance for R3. There is no mention of the type of threat or severity considered. Also no mention of whether both stations are disabled by a single event (bomb) or by multiple events in the same proximate area (shooter(s) or similar). This could lead to different utilities running completely different analyses on the proximate sites. Clarification is also needed to determine which entity is responsible for implementing R3. Although there are situations in which different utilities share or are proximate to each other, there may be an issue with the responsibility for sites brought in within the new 1500 ft perimeter. There is also clarification needed on whether a 3-phase bolted fault or a single-line-to-ground fault is required for the analysis.

Thank you for your comments. The standard cannot reasonably be written to mandate the worst possible event. The DT recognized that physical attack scenarios of the highest severity could be conceived of that would be devasting and even well beyond affecting an Interconnection, but such scenarios would not be credible. The DT feels that the phrase "credible high-severity physical attack" effectively and reasonably manages this issue such that entities should feel compelled to run something that is high in electrical severity but still rooted in reality. Furthermore, the DT feels that requiring a documented justification for the type of Fault(s) simulated prevents any entity from simply adopting the least impactful scenario. R4 addresses your question around multiple entities having responsibilities for studies. The language in R3 around the Fault type is a compromise reached by the drafting team and industry between those who felt that a 3-phase fault was inappropriate as a generic mandate and those who felt that a single-phase fault was not sufficient.

Nathan Browder - Nathan Browder On Behalf of: Matt Lewis, Lower Colorado River Authority, 1, 5; - Nathan Browder

Answer	No
Document Name	

Comment

No. We do not agree with the proposed modifications specifically in section 3.3.3. The added language could lead to inconsistent interpretation of what constitutes a "credible" physical attack scenario and the amount of justification needed for a fault. LCRA believes that how a substation is taken out of service matters less than the result of a substation outage. Irrespective of the cause of the outage, the result is the substation is out of service. The proposed language appears to require entities to first develop physical attack scenarios before performing the study, which feels like doing a threat assessment twice.

For 3.1 ITC requests removal of requirement for technically justified thresholds and instead require only documented criteria for unacceptable generation and load loss within an interconnection. ITC recommends removal of 3.3.1.1 and 3.3.1.2 as a prior loss of communication and protection systems and then an application of a fault or faults isn't a realistic sequence. ITC believes 3.3.1.3 by itself sufficiently describes the intended scenario of using delayed (remote) clearing times unless otherwise technically substantiated.	
Likes 0	
Dislikes 0	
Response	

Thank you for your comments. If the thresholds cannot be technically justified, then a TO could arbitrarily choose them, or even manipulate the thresholds to affect the results of the assessment. The wording of 3.3.1.1 and 3.3.1.2 is to avoid a situation where a TO simulates the fault, uses normal clearing, and then assumes that communications failure.

The Technical Rational Document provides added context. However, the RF team believes in order to address existing issues and the intent of the Standard, more clarity is needed in R3. R3.1 of the Requirement does not call out Steady State or Dynamic studies, while the Technical Rational lists parameters that can be used to evaluate the steady-state and/or dynamic analysis. It is recommended that the thresholds be identified for both Steady State and Dynamic, not and/or. It is recommended that this language should be in the Requirement, not just the Technical Rationale. For R3.3 (3.3.2.1/3.3.3.2) it requires a TO to provide what simulations were run, whereas, the RF team believes a TO's methodology should also include technical justification for which Fault or Faults were run. It is recommended that this language should be in the Requirement, not just the Technical Rationale.	
Likes 0	
Dislikes 0	
Response	
Thank you for your comments. The R3.1 standard language is intentionally general and thus should be taken to apply to steady-state and stability as necessary. The DT believes that technical justification can be in or out of the methodology, as long as it is documented somewhere.	
Ronald Hoover - Bonneville Power Administration - 1,3,5,6 - WECC	
Answer	Yes

Comment	
BPA Transmission Planning supports new Requirement R3, noting its alignment with our current risk assessment methodology and its value in detailing minimum risk assessment requirements for all Transmission Owners. However, we find the generation or load loss criteria regarding specific MW thresholds unclear. NERC should consider adding a net loss criterion or establishing quantitative default benchmarks. Additionally, "Fault" should be specified as a 3-phase Fault, as it is typically the most severe.	
Likes 0	
Dislikes 0	
Response	
Thank you for your comments. There were significant industry objections to explicitly mandating a 3-phase Fault in the standard. The existing language was accepted as a compromise so that TOs that felt it important to use a less extreme Fault could do so but with appropriate documented justification. Putting specific thresholds in the standard is difficult because the thresholds can change with changes in the system.

DE agrees with the modifications, but DE has concerns protections or an exception may be needed where the TO is unable to get the required data from the proximate station or substation owner when performing the assessment in R5. Otherwise, results of the assessment in R5 would be speculative for the portion that addresses R3.3.2.

Jodi Yeary - AEP - 3	
Answer	Yes
Document Name	
Comment	
AEP notices that requirement R3.3 may be unclear and open-ended, creating potential audit risk, specifically regarding the definitions of "credible" or "high severity," which may be subject to inconsistent interpretations and deemed insufficient in an audit context. AEP will develop a justification document around our interpretation of these terms, but recognize that it may be subjective in nature AEP requests clarification around what constitutes "credible" and "high severity" scenarios in the Technical Rationale, while avoiding excessive scenario detail that could serve as a roadmap for malicious actors. AEP also requests clarification around the inclusion of the word *"prior"* from Part 3.3.1.1. The requirement should associate the loss of communications directly with the attack scenario being simulated, rather than requiring a prior loss associated with some undefined earlier scenario. Fault clearing times should be derived from the nature of the simulated scenario, associated fault, and the specific protection scheme applied to each Element at an applicable station. If the acceptable scenarios are to involve loss of communication, that should be explicitly stated. Loss of communication clearing times may be normal or delayed depending on the type of protection system applied to an Element.

Dislikes 0	
Response	

Thank you for your comments. The standard cannot reasonably be written to mandate the worst possible event. The DT recognized that physical attack scenarios of the highest severity could be conceived of that would be devasting and even well beyond affecting an Interconnection, but such scenarios would not be credible. The DT feels that the phrase “credible high-severity physical attack” effectively and reasonably manages this issue such that entities should feel compelled to run something that is high in electrical severity but still rooted in reality. Furthermore, the DT feels that requiring a documented justification for the type of Fault(s) simulated prevents any entity from simply adopting the least impactful scenario. The use of the word "prior" in the context of Part 3.3.1.1 is to prevent situations where the fault might be allowed to clear before the communications is removed.

Chantal Mazza - Chantal Mazza On Behalf of: Junji Yamaguchi, Hydro-Quebec (HQ), 1, 5; Nicolas Turcotte, Hydro-Quebec (HQ), 1, 5; - Chantal Mazza	
Answer	
Document Name	
Comment	

Hydro-Québec supports the following NPCC RSC comments: Please see previous comment that was submitted by NPCC RSC. NPCC RSC believes that only the Transmission Planner (TP) is able to answer R3 and not the TO.

Furthermore, in HQ's view, the technical efforts and resources required to develop the list of critical facilities in accordance with Requirement R3 are significant and are notcost-effectively justifiable when undertaken solely to satisfy the objectives of CIP-014.

As we have previously highlighted, system performance assessments that aim at determining critical elements of a system can only be conducted by an entity that possesses the knowledge of the behavior of the system as whole and can certainly not be performed by a TO alone. As such, the TP and/or PC are the best suited functional entities to determine the critical elements of the power system under their responsibility or jurisdiction. If, for any reason, an explicit transfer of responsibility from the TO to the TP and/or PC is not considered feasible, then the current resulting implicit transfer of burden from the TO to the TP and PC should, at a minimum, be formally acknowledged in writing in the standard. Hydro-Québec agrees that The TP and/or PC, should be required to provide a comprehensive methodology and uniform approach in determining the proper level of contingency applied to the system in their jurisdiction order to determine the CIP-014 applicable facilities list. However, the TP and/or PC **should be allowed to rely on technically qualifying past or related studies** for the purpose of establishing the resulting facilities identified for applicability. Hydro-Québec's vote in favor of this revision is dependent on this flexibility being explicitly stated as such in the standard.

Likes 0	
Dislikes 0	
Response	

Thank you for your comments. The SAR for CIP-014-4 did not allow the drafting team the flexibility to redefine applicability or to assign requirements to TPs or PCs. Making those changes will require a new SAR.

Joshua London - Eversource Energy - 1, Group Name Eversource	
Answer	
Document Name	

Comment
The requirement to document criteria identifying unacceptable generation and load loss “within an Interconnection” is unclear and open to interpretation. It is not clear whether this refers to entities that operate across multiple Interconnections, or whether it requires entities to define thresholds based on impacts to an entire Interconnection. If the latter, this could be interpreted as requiring individual TOs to assess or define Interconnection wide impact criteria, which is beyond their visibility and responsibility. To avoid inconsistent interpretation the drafting team should clarify the intent. If the requirement is meant to address impacts that can be assessed by the entity, the phrase “within an Interconnection” should be completely removed or revised to define the scope more precisely. If the intent is to assess Interconnection wide impacts, the DT should provide a maximum threshold of unacceptable generation and load loss so all TOs are aligned in implementation.

Likes 0	
Dislikes 0	

Response
Thank you for your response. The CIP-014 standard is intended to address events that could impact an Interconnection. The Technical Rationale proposes an approach that can be used to determine thresholds.

Dan Perry - TXNM Energy - 1,3,5 - WECC,Texas RE

Kirsten Rowley - Midcontinent ISO, Inc. - 2, Group Name ISO/RTO Council (IRC) Standards Review Committee (SRC)	
Answer	
Document Name	
Comment	
Similar to the comment provided in response to Question 2, third-party verifications performed under Requirement R6 may not be sufficient to verify the communications proposed under Requirement R3 (specifically R3.3.1.1 regarding prior loss of communication and Protection Systems). Because unaffiliated third parties conducting R6 verifications must rely on the Transmission Owner to supply the necessary information, the intended checks and balances of the review are diminished. At best, information may be collected, but independently verifiable evidence may not be accessible. The IRC SRC recommends that the drafting team acknowledge this limitation in verifiability within the Technical Rationale. Note: AESO, ISO-NE, and SPP abstain from these comments.

Texas RE recommends the following revisions (in bold):	

• 3.1 "…The criteria shall include, at a minimum, technically justified thresholds identifying generation and load loss **that could cause instability, uncontrolled separation, or cascading** within the interconnection." This specifies that unacceptable generation and load loss is loss that could cause instability, uncontrolled separation, or cascading effects. • 3.2 – revise "System peak Load case" to "System **on-Peak** Load case" to ensure consistency with the NERC-defined term. • 3.3.3.1 "Prior loss of communication **or** Protection Systems, **or both**;" This captures the loss of one or both of these components.

Comment	
ITC suggests the removal of or the following revision to Requirement R4: R4. Each Transmission Owner with applicable Transmission station(s) and Transmission substation(s) identified in Requirement R1 containing Bulk Electric System (BES) Elements greater than 200 kV or identified as part of an IROL or essential to meeting an NPIR owned by multiple Transmission Owners shall coordinate with each appropriate Transmission Owner(s) to determine and document their individual and joint responsibilities for documenting a risk assessment methodology under Requirement R3 and for performing any required risk assessments per Requirement R5. R4 is administrative requiring documentation for all joint stations. Many joint stations have existed for decades where the two entities have an understanding of who is responsible for what parts of compliance. When documentation is being required, many entities legal groups will feel a need to be involved making this both time consuming and costly.

Answer	No
Document Name	
Comment	

SRP disagrees with R4 and that Transmission Owners should be held accountable for submitting their respective documentation for their substations. The coordination effort may be difficult depending on the methodologies and scenarios, and it could affect the outcomes. R4 could also create a compliance risk, as utilities may be held responsible for the inaction or unresponsiveness of other utilities.

BPA Transmission Planning supports the new Requirement R4, recognizing its value in promoting collaborative assessments of joint substations using a shared methodology. However, the current wording poses considerable coordination challenges and presumes a degree of inter-entity collaboration, scheduling, and methodological consistency that may be impractical. Furthermore, it creates a compliance risk for individual entities, making them reliant on the actions and responsiveness of others.

Req #4 specifically addresses facilities (BES Elements) with joint ownership to coordinate/collaborate. One improvement would be to include Transmission Owners whose stations have been identified as part of Req #2 to also be included in this requirement to coordinate. The ownership of the applicable and proximate stations may be different, and thus we feel the concept of coordination with respect to Req #2 should apply.

The requirement is appropriate in the context that the referenced risk assessment is from a physical security perspective and not a transmission planning analysis perspective. Should the intent of this comment be applicable to physical security and not a transmission planning analysis, then our answer would be yes

Comment	
SNPD strongly disagrees with adopting a 36-month risk assessment interval for utilities that have not previously identified any Transmission stations or substations as critical. This change would increase study costs without providing a meaningful improvement to the reliability of the Bulk Electric System (BES). Instead, SNPD recommends retaining the existing 60-month assessment interval for Transmission Owners (TOs) that have not identified any applicable critical facilities. This approach should continue to include Transmission stations and substations that are planned to be placed in service within the next 60 calendar months. For these utilities, reducing the assessment interval from 60 months to 36 months would result in unnecessary cost increases due to more frequent studies. Given their historical results, these additional assessments are unlikely to identify any new facilities that would qualify as CIP-014 critical beyond those already identified under CIP-014-3. As such, the proposed change offers little to no reliability benefit to the BES.

Response	
Thank you for your comments. A directive of the SAR was to “correct any discrepancies between the study period, frequency of study, and the base case{s} a Transmission Owner uses.” The Drafting Team chose a timeframe that balanced the directive of the SAR and the comments from industry to make the timeframe either shorter or longer than 36 months.	
Jeffrey Streifling - NB Power Corporation - 1	
Answer	No

R5. Clarify if at the end of the 36-month period the entity must have the Risk Assessment started or completed? TFIST suggest splitting the operational assessment and security assessment into distinct assessments in the timeline to reduce confusion and not just referred to as the “risk assessment”. In the last sentence of R5, “they should also be included in the risk assessment” TFIST questions if this makes the proximate Transmission station(s) and Transmission substation(s) optional in the risk assessment?	
Likes 0	
Dislikes 0	
Response	
Thank you for your comments. At the end of the 36-month period the entity must have the Risk Assessment completed. The Drafting Team believes the current language provides an appropriate framework for completing the required assessment activities. The Drafting Team does not believe further clarification is needed. The last sentence of R5 is: “If proximate Bulk Electric System Transmission station(s) and Bulk Electric System Transmission substation(s) were identified in Requirement R2, they shall be included in the risk assessment according to Requirement R3, Part 3.3.” This is not optional.	
Zahid Qayyum - New York Power Authority - 5	
Answer	No
Document Name	
Comment	
NYPA believes it would be better to clarify the 36-calendar month requirement in R5 applies at the initiation or at the completion of the risk assessment. As currently written, the requirement could be interpreted either way, which may lead to inconsistent implementation and would help clarify confusion especially during the transition to the new standard. NYPA believes the SDT may consider separating the operational assessment and security assessment into distinct assessments within the timeline, rather than collectively referring them as “risk assessment” to further improve clarity and reduce ambiguity”

For 5.1, failure to perform the entirety of the risk assessment could have an TO not completing either the stability or steady state portion of the study. If the third party reviewer identified a mistake in the piece of the study that was completed, they have nothing to verify for the second half of the study as	

it was not performed. Changes to the system which add resiliency to the system may have changed a previous critical station to a non-critical station. Not studying it going forward means that the costs would continue to be incurred for protecting a station that does not require it. ITC recommends removing 5.2 as this is not language conducive to a standard requirement.	
Likes 0	
Dislikes 0	
Response	
Thank you for your comments. The Drafting Team believes Requirement R5, Part 5.2 provides appropriate flexibility and remains appropriate for the standard. Part 5.2 does not prevent a Transmission Owner from performing a new risk assessment when warranted.

The NSRF notes that the purpose statement in the standard was revised from "could **cause** instability" to "could **result in** instability." This change was reflected in R5, but parts R5.1, R5.2, and R5.3 still have the previous wording "as causing instability" instead of "resulting in instability." This change is recommended for consistency. The NSRF believes this to be a non-substantive change.

There is no issue with performing a risk assessment every 36 months. However, Transmission Owners are not the appropriate registered entity to conduct planning analyses. Nor are the CIP standards the appropriate place to document planning analysis requirements. Planning studies should be governed within the TPL group of standards.	
Likes 0

Recommend clarifying R5.3. As written, it is unclear whether the requirement applies only to the applicable entity's control center or also to a neighboring entity's control center that could contribute to instability, uncontrolled separation, or Cascading. If neighboring facilities must be identified, there is a risk they may not be notified, as no requirement currently exists to inform adjacent entities of their inclusion in a CIP-014 assessment. Clearer language would help ensure consistent expectations and appropriate coordination.	
Likes 0	
Dislikes 0	
Response	

Thank you for your comments. The Drafting Team believes requirement R5, Part 5.3 provides sufficient clarity regarding identification of the primary control center. The drafting team does not leave additional revisions to requirement R5 are necessary.

For the Implementation Plan section on Initial Performance of Periodic Requirements, BPA is concerned about the potential for having to re-do work under V3 and then shortly thereafter have to do similar work to comply with V4. This is a concern when there are many sites to put through the cycle. BPA requests that the implementation plan instead use the approach found in FAC-014-3: shall be implemented by the [Registered Entity] following the effective date of [the standard] when it begins its next cycle for conducting the studies [required by the standard]. BPA also seeks clarification on R5.2 concerning critical stations identified in prior risk assessments. **Additional Assessments and Duration:** What specifically constitutes "additional assessments," and for what duration can these be forgone?	

Trigger for New Risk Assessment: Does the Transmission Owner unilaterally determine when a new risk assessment is necessary, especially given that R5.3 and R7-R10 still apply "until a new risk assessment demonstrates otherwise"?	
Likes 0	
Dislikes 0	
Response	
Thank you for your comments. The Drafting Team believes the Implementation Plan provides an appropriate transition for implementation of CIP-014-4. Regarding Requirement R5, Part 5.2, the Drafting Team believes the current language provides sufficient clarity regarding when a Transmission Owner may forgo additional assessments for a previously identified Transmission station or Transmission substation. Part 5.2 does not prevent a Transmission Owner from performing a new risk assessment when warranted. The Drafting Team does not believe additional revisions are necessary.	
Rachel Coyne - Texas Reliability Entity, Inc. - 10	
Answer	
Document Name	
Comment	
Texas RE noticed that the requirement language does not quite clarify how the terms inoperable and damaged should be reflected in the risk assessment as noted on page 4 of the SAR. It appears the SDT may be trying to address this in Requirement Part 3.1. The SDT could consider revising requirement part 3.1 to the following, which includes recommended changes in response to question #3 (in bold). 3.1 Documented criteria for assessing instability, uncontrolled separation, or Cascading within an Interconnection. The criteria shall include, at a minimum, the following: 3.1.1 technically justified thresholds identifying generation and load loss **that could cause instability, uncontrolled separation, or cascading** within the interconnection;	

3.1.2 **Clarification of the terms “inoperable” and “damaged” as used in the risk assessment.**

Comment	
ITC believes there could be issues with identifying all of the proximity stations soon enough to identify their configurations and clearing times soon enough to perform all of the required studies. This is more of an issue as entities add facilities in additional states. The number of coordination agreements could also cause an issue in obtaining all of the required documentation. ITC recommends allowing 36 months for the implementation of the plan as several of the new proposed requirements will take significant time to prepare for prior to running the studies.

Response	
Thank you for your comments. The DT continues to support the statements under “General Considerations” in the Implementation Plan on this issue. In determining an appropriate time frame, the DT considered: 1) the severity of the concerns highlighted in the FERC December 2022 order; (2) the recommendations of the NERC report entitled Evaluation of the Physical Security Reliability Standard and Physical Security Attacks to the Bulk-Power System; and (3) the Standard Authorization Request requirements. The DT determined that an Implementation Plan schedule of 24 calendar months appropriately balances the reliability need and risks against the time and resources required of entities to comply.	

Rachel Coyne - Texas Reliability Entity, Inc. - 10	
Answer	**Answer**
Document Name	**Document Name**
Comment	

Texas RE is concerned the implementation plan has a disconnect between the effective date and initial performance dates of Requirements R1 and R5. Texas RE also requests guidance on how this implementation plan works with the existing 36-month intervals for Requirements R1 and R5.

Texas RE notes that Requirement R1, which defines the process for identifying applicable Transmission stations or substations for use required risk assessments, does not specify an initial performance date. Absent an initial performance date, it is arguable that entities are not required to perform the first identification activities described in Requirement R1 until 36 calendar months following the effective date (that is, the interval period outlined in the specific requirement). However, the draft Implementation Plan states that the initial performance of the risk assessment activities required by the proposed Requirement R5 should occur by the effective date of the standard.

Importantly, however, those risk assessment activities in Requirement R5 explicitly contemplate using the station or substations identified through the Requirement R1 process. Per the language in the proposed Requirement R5, "each Transmission Owner shall perform a risk to identify applicable Transmission station(s) or Transmission substation(s) **identified in Requirement R1**" that if rendered inoperable would result in instability, uncontrolled separation, or cascading (emphasis added). Texas RE is concerned given the explicit expectation that entities perform at least some form of Requirement R1 identification activities prior to the risk assessment activities described in Requirement R5 that registered entities may be confused as the appropriate order of performance. For instance, one possible reading is that entities may use a current list of facilities for the initial performance of the new Requirement R5 risk assessment. Other registered entities may read the Requirement R1 identification process as subsumed with the Requirement R5 risk assessment and perform all those steps prior to the effective and initial performance date. In order to avoid potential inconsistent applications of the proposed standard language, Texas RE recommends that the SDT clarify whether the expectation is for a new Requirement R1 station and substation identification process should be performed in support of the initial performance of the proposed Requirement R5 risk assessment process or if the previously existing Requirement R1 stations and substations may be used.

Texas RE also inquires as to how this implementation plan considers that currently-registered applicable entities are required to this work under CIP-014-3. Does the timeline for Requirement R1 and Requirement R5 start over once CIP-014-4 is approved? Texas RE requests the drafting team provide guidance on the relationship between current activities and the implementation plan for CIP-014-4.

Lastly, Texas RE recommends the drafting team reference the practice guide regarding use of the term "calendar months."

Response	
Thank you for your comments. The DT believes that work for CIP-014-4 Requirements R1 through R5 should be completed prior to the effective date of CIP-014-4. Furthermore, the DT believes that the requirements run sequentially, such that the timing of the 36 calendar months cycle can be set by either the beginning or the end of the risk assessment. The DT suggests that any Transmission Owners beginning a risk assessment under CIP-014-3 conduct the risk assessment in such a way as to comply with CIP-014-4.

BPA disagrees with the proposed implementation plan. The current 24-month timeline may be insufficient for Transmission Owners to complete their next assessment under the new standard. Therefore, we recommend extending the implementation plan to 36 months or more.

Reclamation recommends revising the Implementation Plan for Initial Performance of Periodic Requirements, noting concerns about duplicating work under V3 and V4, especially with many sites involved. Additionally, Reclamation recommends adopting the FAC-014-3 approach for the implementation plan: requirements should be implemented by the [Registered Entity] at the start of its next study cycle following the effective date of [the standard].

Comment	

Exelon agrees with the Implementation Plan, however the EEI comments highlight a concern that some entities my be required to complete assessments for CIP-014-3 and CIP-014-4 in the same timeframe.

Exelon supports the clarifications suggested in the EEI comments included below:

A Transmission Owner may perform a risk assessment consistent with CIP-014-4 at any time following approval of CIP-014-4 by the appropriate regulatory authority. Where such an assessment is completed during the implementation period and prior to the effective date of CIP-014-4, that assessment shall be deemed acceptable for purposes of satisfying any then-applicable periodic risk assessment due date under CIP-014-3.

If a Transmission Owner completes a risk assessment consistent with CIP-014-4 prior to the effective date of CIP-014-4, and that assessment is completed within the Transmission Owner's then-applicable CIP-014-3 periodic risk assessment interval, the assessment shall satisfy the periodic risk assessment obligation in CIP-014-3 Requirement R1.

No additional or separate CIP-014-3 risk assessment is required to meet the CIP-014-3 periodic due date in this circumstance.

The completion date of a CIP-014-4 risk assessment used to satisfy a CIP-014-3 periodic requirement shall establish the start date for the applicable entity's next periodic risk assessment interval under CIP-014-4.

A CIP-014-4 risk assessment completed during the implementation period and used to satisfy a CIP-014-3 periodic due date shall remain valid following the retirement of CIP-014-3.

SNPD recognizes the increased financial burden associated with performing risk assessments every 36 months, rather than every 60 months, for Transmission Owners that have not identified any applicable Transmission stations or substations. This burden is further amplified by the requirement to have each assessment verified by an unaffiliated third party at the same increased frequency. SNPD believes there are more cost-effective alternatives to address the physical security reliability objectives of CIP-014-4. Specifically, SNPD recommends maintaining a risk-based, performance-oriented approach by retaining the existing 60-month assessment interval for Transmission Owners that have not previously identified any applicable facilities. For these entities, historical assessments have demonstrated a low likelihood of identifying critical assets, and increasing the frequency does not provide a commensurate reliability benefit. Additionally, SNPD recommends that enhanced requirements, such as performing risk assessments every 36 months and requiring third-party verification, be applied only to entities that have previously identified critical Transmission stations or substations, or where system changes indicate a higher risk profile. This targeted, risk-based approach would better align regulatory requirements with actual system risk and improve overall cost-effectiveness. SNPD also supports continued inclusion of planned Transmission stations and substations expected to be placed in service within the assessment window, ensuring that future system changes are appropriately evaluated without imposing unnecessary burdens on entities with consistently low-risk profiles. Overall, a tiered, risk-informed framework would more effectively balance reliability objectives with cost considerations, while avoiding unnecessary regulatory and financial impacts on entities unlikely to identify CIP-014 critical facilities.

Currently, CIP-014 requires Transmission Owners to conduct planning analyses, and then have these analyses reviewed by a third party verifier. Requirement 6.1 states the the third party verifier must be a registered Planning Coordinator, Transmission Planner, Reliability Coordinator, or have transmission planning or analysis experience. Therefore, instead of a planning entity performing the study, the TO must pay a third party to verify the assessment and now at a higher frequency (36 month vs 60 month).

The current standard treats physical security measures as the default solution and does not clearly allow for system-level mitigations. In many cases, lower cost options could be available. Take a system issue for example that leads to instability could instead be resolved by changing relay settings to be more sensitive when normally redundant communication is lost, this would lead to an inexpensive solution to fix the problem, whereas a physical barrier such as a fence does not address the risk exposure of the lines leaving the station. It is strongly recommended that the standard includes some sort of concept where utilities could alternately identify solutions, as confirmed by the 3rd party, in lieu of directly going to the physical security step. As written, the standard does not prohibit system-level solutions, but it also does not acknowledge them or present them as viable alternatives to physical security measures. This lack of clarity limits the opportunity to pursue effective, lower-cost fixes that directly address the underlying issue.	

More technical guidance from NERC on damage distances for a variety of bomb threat types is recommended and modifying the distance requirement in R2 to be based upon damage thresholds rather than personnel evacuation mandates. Additionally in R2, allowing utilities the flexibility to provide rationale in their CIP-014 assessments for why any identified proximate stations within the provided distance should be excluded or if any different distances are used would lead to more realistic physical security scenarios being assessed and reduce the cost-burden of assessing scenarios that are beyond reasonable damage distances.

Similar to TPL-001-5.1 Requirement 2.6, we recommend that the SDT consider, and if applicable, outline under which specific circumstances past studies/results can be utilized for the CIP-014-4 risk assessment. The possible use of past studies may reduce workload of entities and support a more cost effective option to address CIP-014-4 needs.

There needs to be much more clarification regarding the issue raised in the comments. The Standard has changed a lot since the last iteration but so have threats and the means to mitigate them. If the Standard considered some of the ideas and clarifications brought up by SRP and others, it would be for the betterment of the industry.

The requirement for documentation for joint station is not cost effective. Requiring all entities to provide this documentation for historic stations is an administrative burden. This requirement should only be applicable to those entities who failed to perform a risk assessment for a joint station. The requirement to include proximity stations owned by other entities puts unreasonable requirements on the TO as other entities may not willingly provide, and may not be bound by CIP-14 to provide, documentation for those stations. In addition, it places unreasonable burden on the TO to field visit and identify proximity stations prior to studies each cycle. ITC suggests narrowing the scope to existing BES Transmission station(s) and BES Transmission substation(s) which are owned by the applicable entity, or including a requirement that neighboring entities are required to provide station names and GIS locations.

OPG supports the following NPCC Regional Standards Committee's comments:

"CIP-014-4 standard:
1. R2: add BES acronym to first instance of the use of Bulk Electric System and replace with BES throughout the rest of the standard.
2. When referring to "control center" throughout the standard, are we referring to the NERC Glossary term "Control Center"? If so, please consider capitalizing the term throughout the standard.
3. R5 High VSL: refers to Part 5.2 however the primary control center is identified in Part 5.3.
Technical Rationale:
1. Replace references to CIP-002-5.1 for CIP-002-5.1a throughout the document.
2. Replace the reference to EOP-004-2 on page 18 with EOP-004-4.
3. The Technical Rationale for CIP-014 Requirement R3, Part 3.3.3 should include a statement that the use of three-phase faults at applicable stations constitutes an acceptable approach. The concern raised is that the requirement language "[a] documented justification for the Fault(s) associated with physical attack to be simulated" could be interpreted as requiring the Transmission Owner to perform an (in-depth/detailed) analysis of potential credible high-severity scenario for a physical attack even if a (generally worst-case) three-phase fault is the selected Fault type."

It's Seminole's understanding that NERC has instated an Abeyance Program for certain Reliability Standards. It's unclear to Seminole that if a Standard is not identified in the abeyance program as to whether then it should be treated as a zero defect Standard, and therefore, Seminole requests that this

Standard be entered formally into the NERC Abeyance Program. If not put into the NERC Abeyance Program, Seminole requests that the NERC Standard Drafting Team identify that this Standard should not be treated as a zero-defect Standard.

Response	
Thank you for the comment. NERC monitors input and comments during development to determine if a project meets criteria for development. Given there was not an indication that debates over compliance risk would lead to an inability to achieve consensus on requirements language, the DT has been informed that NERC has determined that CIP-014-4 is not appropriate for compliance abeyance.

The primary issue with this standard as it is written, and as this draft continues is the application of requirements/expectations appropriate for the Transmission Planner/Planning Coordinator function to the Transmission Owner instead. Developing steady-state and dynamic simulation criteria is a planning function and should not be required of a Transmission Owner. The sub-requirements (of R3) go further into addressing what a transmission	

planning study should include but applies this requirement incorrectly to the Transmission owner. The intent of R3 is more appropriately applicable to the TPL body of standards. More appropriately, CIP-014 should reference output from a study performed in accordance with a clearly defined TPL requirement for an extreme event involving the loss of an applicable Transmission station(s) or substation(s).

This reduces clarity on the types of studies to be performed to assess the extreme events identified in this standard. The revisions may follow the scope of the SAR but this fundamental flaw is still an issue.

Regarding R6:

With an attempt at clarifying study criteria, though they should be applied to the appropriate planning entity, there is no reason to maintain a requirement for an unaffiliated third party to perform a verification of a transmission planning analysis associated with the risk assessment. Instead of requiring planning entities be the third party verifier, they should just perform the study under clearly defined requirements in a TPL standard and communicate this information to the Transmission Owner. It is also important to note the third party verifying the risk assessment for this physical security standard is not required to have expertise in that area according to this requirement. Additionally, the SDT should consider removing the Reliability Coordinator as a potential third party verifier as that function does not perform the type of analysis being sought in this standard.

Additional Comment:

The analysis outlined in the CIP-014 standard is an evaluation of an extreme event and is based on transmission planning analysis. It would seem NERC and the industry are potentially missing an opportunity to consolidate requirements around the evaluation of extreme events better than what is currently provided for in the current construct of the existing and planned Reliability Standards. Consideration should be given to provide a better pathway to house long-term planning requirements around extreme event analysis within the TPL standards (not CIP) and specify the reliability analyses needed, the parameters for determining reliability, expectations for corrective actions, and the communication path from planning to owners and others with a reliability-related need for this information. The planning assessment/CAP required by TPL-001 is already required to be distributed to applicable owners. Clarifying the extreme event expectations in TPL-001 (or other planning standard) to specify that evaluating the substation outage outlined in CIP-014 every 36 months is one pathway to better align standard requirements with the appropriate entity.

Likes 0

Response

Thank you for your comments. The SAR did not allow for the drafting team to add additional responsible entities such as TPs and PCs. A new SAR will be required for this change. If a risk assessment identifies a transmission station or transmission substation as causing instability, uncontrolled separation, or Cascading within an Interconnection when rendered inoperable or damaged, then the TO can chose to forego future assessments for that substation, provided Requirements R7 through R10 continued to be adhered to. The TO has the choice of which order in which to perform the dynamic and steady-state simulations.	
Jodi Yeary - AEP - 3

Comment	
AEP recommends adding a Moderate VSL for R2 as follows (change indicated in ***bold***): Moderate VSL: "The Transmission Owner with applicable Transmission station(s) or Transmission substation(s) identified in Requirement R1 ***failed to identify one*** existing Bulk Electric System Transmission station(s) and Bulk Electric System Transmission substation(s), irrespective of ownership, within 1500 feet or 457 meters (the shortest distance, measured substation fence line to substation fence line) of an applicable Transmission station or Transmission substation identified in Requirement R1." AEP also recommends adding clarification to the Severe VSL for R2 (change indicated in ***bold***): Severe VSL: "The Transmission Owner with applicable Transmission station(s) or Transmission substation(s) identified in Requirement R1 ***failed to identify any*** existing Bulk Electric System Transmission station(s) and Bulk Electric System Transmission substation(s), irrespective of ownership, within 1500 feet or 457 meters (the shortest distance, measured substation fence line to substation fence line) of an applicable Transmission station or Transmission substation identified in Requirement R1." Finally, AEP recommends removing the phrase "any evidence for" from the Severe VSL for R4 to correct a typographical error. The revised language would read (remove **italisized*)*: "…for more than 75% and less than or equal to 100% of **any evidence for of** jointly owned applicable Transmission station(s) and Transmission substation(s)."

Thank you for your comments. The DT agrees with the BES acronym comment and will make changes. The term "control center" as used in both CIP-014-3 and CIP-014-4 is intentionally general and thus is not referring to the NERC Glossary term. The R5 High VSL reference to Part 5.2 is indeed a typo and will be changed to 5.3. Similarly, the CIP-002-5.1 and EOP-004-2 references will be corrected.

Comment	
The IRC SRC notes that Criterion 3 in Attachment 1 references Facilities identified by the Planning Coordinator as critical to the derivation of an Interconnection Reliability Operating Limit (IROL). However, under FAC-014-3, Planning Coordinators no longer develop IROLs. The SRC recommends that Criterion 3 be updated accordingly to remove the reference to the Planning Coordinator. The IRC SRC also recommends a new SAR could be developed to remove Requirement R6 from the proposed CIP-014-4 standard. The new requirements proposed in CIP-014-4 Requirements R1-R5 outline necessary specifics for more meaningful risk assessments, which reduces the need for unaffiliated third-party verification, especially given that auditors are also directed to apply various methods to test the validity of station identifications under current CIP-014-3 Requirement R1. Note: AESO, ISO-NE, and SPP abstain from these comments.	
Likes 0	
Dislikes 0	
Response	
Thank you for your comments. As the CIP-014-4 SAR did not address the IROL language issue, it will need to be addressed via existing NERC Project 2021-03 or via a new SAR. Similarly, the CIP-014-4 SAR did not address third-party verification, and as such would also need to be addressed via a new SAR.

The primary issue with this standard as it is written, and as this draft continues is the application of requirements/expectations appropriate for the Transmission Planner/Planning Coordinator function to the Transmission Owner instead. Developing steady-state and dynamic simulation criteria is a planning function and should not be required of a Transmission Owner. The sub-requirements (of R3) go further into addressing what a transmission planning study should include but applies this requirement incorrectly to the Transmission owner. The intent of R3 is more appropriately applicable to the TPL body of standards. More appropriately, CIP-014 should reference output from a study performed in accordance with a clearly defined TPL requirement for an extreme event involving the loss of an applicable Transmission station(s) or substation(s). This reduces clarity on the types of studies to be performed to assess the extreme events identified in this standard. The revisions may follow the scope of the SAR but this fundamental flaw is still an issue.	

Regarding R6: With an attempt at clarifying study criteria, though they should be applied to the appropriate planning entity, there is no reason to maintain a requirement for an unaffiliated third party to perform a verification of a transmission planning analysis associated with the risk assessment. Instead of requiring planning entities be the third party verifier, they should just perform the study under clearly defined requirements in a TPL standard and communicate this information to the Transmission Owner. It is also important to note the third party verifying the risk assessment for this physical security standard is not required to have expertise in that area according to this requirement. Additionally, the SDT should consider removing the Reliability Coordinator as a potential third party verifier as that function does not perform the type of analysis being sought in this standard. Additional Comment: The analysis outlined in the CIP-014 standard is an evaluation of an extreme event and is based on transmission planning analysis. It would seem NERC and the industry are potentially missing an opportunity to consolidate requirements around the evaluation of extreme events better than what is currently provided for in the current construct of the existing and planned Reliability Standards. Consideration should be given to provide a better pathway to house long-term planning requirements around extreme event analysis within the TPL standards (not CIP) and specify the reliability analyses needed, the parameters for determining reliability, expectations for corrective actions, and the communication path from planning to owners and others with a reliability-related need for this information. The planning assessment/CAP required by TPL-001 is already required to be distributed to applicable owners. Clarifying the extreme event expectations in TPL-001 (or other planning standard) to specify that evaluating the substation outage outlined in CIP-014 every 36 months is one pathway to better align standard requirements with the appropriate entity.

Understanding that R6, formerly R2 under CIP-014-3, is out of scope for this SAR, MRO NSRF requests that the drafting team make a recommendation to the Standards Committee based on industry feedback that a SAR be drafted to remove R6 as an administrative burden. It should no longer be needed, given that this project has added the necessary specifics required for a meaningful risk assessment, diminishing the need for third-party verification. Also, there has been anecdotal experience as an industry that auditors have audited the (CIP-014-3) R1 risk assessments directly without relying on the R2 third-party verification as directed by the RSAW. If (CIP-014-4) R6 is to be retained, 90 calendar days for completing R6 in R6.2 is proving to be tight for some larger entities, which request extension to 180 calendar days (which would be much easier to calculate as six calendar months to avoid getting tripped up on 28/30/31-day months). The MRO NSRF requests that the requirement R10 for a third-party review of the physical security plan be considered for removal as part of the same SAR, this requirement similarly adds administrative burden without benefit to the BES.

ATC has no additional comments, and thanks the drafting team for the approach taken. ATC has more conservative methodologies for most requirements that go above and beyond these new obligations and accomplishes these additional requirements through the implementation of our standards.

Standard Development Timeline

This section is maintained by the drafting team during the development of the standard and will be removed when the standard is adopted by the NERC Board of Trustees (Board).

Description of Current Draft

CIP-014-4 is posted for a 45-day formal comment period with additional ballot.

Completed Actions	Date
Standards Committee approved Standard Authorization Request for posting	June 21, 2023
Standard Authorization Request posted for comment	July 26 – August 24, 2023
Accepted Revised Standard Authorization Request	January 17, 2024
45-day formal or informal comment period with ballot	May 20 – July 3, 2024
45-day formal or informal comment period with additional ballot	September 23 – November 6, 2024
45-day formal comment period with additional ballot	June 6 – July 21, 2025
45-day formal comment period with additional ballot	March 31 – May 14, 2026

Anticipated Actions	Date
10-day final ballot	May 28 – June 8, 2026
Board adoption	June 17, 2026

New or Modified Term(s) Used in NERC Reliability Standards

This section includes all new or modified terms used in the proposed standard that will be included in the *Glossary of Terms Used in NERC Reliability Standards* upon applicable regulatory approval. Terms used in the proposed standard that are already defined and are not being modified can be found in the *Glossary of Terms Used in NERC Reliability Standards*. The new or revised terms listed below will be presented for approval along with the proposed standard. Upon Board adoption, this section will be removed.

Term(s):

None.

A. Introduction

1. **Title:** Physical Security

2. **Number:** CIP-014-4

3. **Purpose:** To identify and protect Transmission stations and Transmission substations, and their associated primary control centers, that if rendered inoperable or damaged due to a physical attack, could result in instability, uncontrolled separation, or Cascading within an Interconnection.

4. **Applicability:**

   4.1. Functional Entities:

   4.1.1. Transmission Owner that owns or jointly owns one or more Transmission stations or Transmission substations that meet the applicability criteria of Attachment 1.

   4.1.2. Transmission Operator

   Exemption: Facilities in a "protected area," as defined in 10 C.F.R. § 73.2, within the scope of a security plan approved or accepted by the Nuclear Regulatory Commission are not subject to this Standard; or Facilities within the scope of a security plan approved or accepted by the Canadian Nuclear Safety Commission are not subject to this Reliability Standard.

5. **Effective Date:** See Implementation Plan for CIP-014-4.

B. Requirements and Measures

R1. Each Transmission Owner shall, at least once every 36 calendar months, identify each applicable Transmission station and Transmission substation meeting any of the criteria in Attachment 1 that is either existing or planned to be in service within 36 calendar months. *[Violation Risk Factor: High; Time-Horizon: Long-term Planning]*

M1. Examples of evidence may include, but are not limited to, dated written or electronic documentation of the Transmission station(s) and Transmission substation(s) (existing and those planned to be in service within 36 calendar months) that meet any of the criteria in Attachment 1.

R2. Each Transmission Owner with applicable Transmission station(s) or Transmission substation(s) identified in Requirement R1 shall identify proximate existing Bulk Electric System (BES) Transmission station(s) and BES Transmission substation(s), irrespective of ownership, within 1500 feet or 457 meters (the shortest distance, measured substation fence line to substation fence line) of an applicable Transmission station or Transmission substation identified in Requirement R1. *[Violation Risk Factor: Medium; Time-Horizon: Long-term Planning]*

M2. Examples of evidence may include, but are not limited to, dated written or electronic documentation of the BES Transmission stations or BES Transmission substations identified in Requirement R2.

R3. Each Transmission Owner shall have a documented risk assessment methodology for evaluating the loss of each applicable Transmission station or Transmission substation identified in Requirement R1. The methodology shall include, at a minimum, the following: *[Violation Risk Factor: High; Time-Horizon: Long-term Planning]*

3.1. Documented criteria for assessing instability, uncontrolled separation, or Cascading within an Interconnection. The criteria shall include, at a minimum, technically justified thresholds identifying unacceptable generation and load loss within an Interconnection.

3.2. A provision that steady-state and dynamic simulations shall each be performed using at a minimum one System peak Load case and one System Off-Peak Load case.

3.3. Specifications for simulations at each applicable Transmission station or Transmission substation identified in accordance with Requirement R1 and, if applicable, at each associated proximate existing BES Transmission station(s) and BES Transmission substation(s) identified in accordance with Requirement R2, that include:

3.3.1. At the applicable Transmission station or Transmission substation:

3.3.1.1. Prior loss of communication and Protection Systems;

3.3.1.2. Application of a Fault or Faults; and

3.3.1.3. Delayed (remote) clearing times shall be used unless otherwise technically substantiated.

3.3.2. At each proximate existing BES station(s) and BES substation(s), as applicable:

3.3.2.1. Application of a Fault or Faults, either simultaneous with or following the Fault or Faults applied under Part 3.3.1.2; and

3.3.2.2. Normal clearing times shall be used unless otherwise technically substantiated.

3.3.3. A documented justification for the Fault(s) associated with physical attack to be simulated. A single justification may be used for multiple locations. The justification shall include at a minimum:

3.3.3.1. The type of credible high-severity physical attack considered; and

3.3.3.2. The type of Fault(s) selected based upon the attack considered.

3.3.4. Removal of all Elements that Protection Systems and other controls are expected to automatically disconnect.

3.3.5. Actual or more conservative clearing times shall be used.

M3. Each Transmission Owner shall provide dated evidence, such as electronic or hard copies, of a risk assessment methodology satisfying Requirement R3.

R4. Each Transmission Owner with applicable Transmission station(s) and Transmission substation(s) identified in Requirement R1 jointly owned by multiple Transmission Owners shall coordinate with each appropriate Transmission Owner(s) to determine and document their individual and joint responsibilities under Requirement R3 and Requirement R5. *[Violation Risk Factor: Medium; Time-Horizon: Operations Planning, Long-term Planning]*

M4. Examples of acceptable evidence may include, but are not limited to, dated documentation, such as meeting minutes, agreements, and email correspondence, that identifies that agreement has been reached on individual and joint responsibilities for performing the required risk assessments.

R5. At least once every 36 calendar months, each Transmission Owner shall perform a risk assessment to identify applicable Transmission station(s) and Transmission substation(s) identified in Requirement R1, that if rendered inoperable or damaged could result in instability, uncontrolled separation, or Cascading within an Interconnection, using the methodology established in Requirement R3. Jointly owned Transmission station(s) and Transmission substation(s) shall be assessed according to the responsibilities documented under Requirement R4. If proximate BES station(s) and BES Transmission substation(s) were identified in Requirement R2, they shall be included in the risk assessment according to Requirement R3, Part 3.3. *[Violation Risk Factor: High; Time-Horizon: Operations Planning, Long-term Planning]*

5.1. If during a risk assessment, a Transmission station or Transmission substation is identified in either the dynamic or steady-state simulation as resulting in instability, uncontrolled separation, or Cascading within an Interconnection when rendered inoperable or damaged, then no further simulation is required.

5.2. If a previous risk assessment has identified a Transmission station or Transmission substation as causing instability, uncontrolled separation, or Cascading within an Interconnection when rendered inoperable or damaged, then the Transmission Owner may forgo additional assessments on that Transmission station or Transmission substation. Requirement R5, Part 5.3 and Requirement R7 through Requirement R10 still apply to that Transmission station or Transmission substation until a new risk assessment demonstrates otherwise.

5.3. The Transmission Owner shall identify the primary control center that operationally controls each Transmission station or Transmission substation identified as resulting in instability, uncontrolled separation, or Cascading within an Interconnection when rendered inoperable or damaged in the Requirement R5 risk assessment.

M5. Examples of acceptable evidence may include, but are not limited to, dated written or electronic documentation of the risk assessment satisfying Requirement R5 including the identified Transmission station(s) or Transmission substation(s). For Requirement R5, Part 5.3, examples of acceptable evidence may include, but are not limited to, dated written or electronic documentation of the identification of the primary control center that operationally controls each identified Transmission station or Transmission substation.

R6. Each Transmission Owner shall have an unaffiliated third party verify the risk assessment performed under Requirement R5. The verification may occur concurrently with or after the risk assessment performed under Requirement R5. *[Violation Risk Factor: Medium; Time-Horizon: Long-term Planning]*

6.1. Each Transmission Owner shall select an unaffiliated verifying entity that is either:

- A registered Planning Coordinator, Transmission Planner, or Reliability Coordinator; or
- An entity that has transmission planning or analysis experience.

6.2. The unaffiliated third-party verification shall verify the Transmission Owner's risk assessment performed under Requirement R5, which may include recommendations for the addition or deletion of a Transmission station(s) or Transmission substation(s). The Transmission Owner shall ensure the verification is completed within 90 calendar days following the completion of the Requirement R5 risk assessment.

6.3. If the unaffiliated verifying entity recommends that the Transmission Owner add a Transmission station(s) or Transmission substation(s) to, or remove a Transmission station or Transmission substation from, its identification under Requirement R5, the Transmission Owner shall either, within 60 calendar days of completion of the verification, for each recommended addition or removal of a Transmission station or Transmission substation:

- Modify its identification under Requirement R5 consistent with the recommendation; or
- Document the technical basis for not modifying the identification in accordance with the recommendation.

6.4. Each Transmission Owner shall implement procedures, such as the use of non-disclosure agreements, for protecting sensitive or confidential information made available to the unaffiliated third-party verifier and to protect or exempt sensitive or confidential information developed pursuant to this Reliability Standard from public disclosure.

M6. Examples of acceptable evidence may include, but are not limited to, dated written or electronic documentation that the Transmission Owner completed an unaffiliated third party verification of the Requirement R5 risk assessment and satisfied all of the applicable provisions of Requirement R6, including, if applicable, documenting the technical basis for not modifying the identification in Requirements R1, R2, R3, R4, and R5 as specified under Part 6.3. Additionally, examples of evidence may include, but are not limited to, written or electronic documentation of procedures to protect information under Part 6.4.

R7. For a primary control center(s) identified by the Transmission Owner according to Requirement R5, Part 5.3 that a) operationally controls an identified Transmission station or Transmission substation verified according to Requirement R6, and b) is not under the operational control of the Transmission Owner: the Transmission Owner shall, within seven calendar days following completion of Requirement R6, notify the Transmission Operator that has operational control of the primary control center of such identification and the date of completion of Requirement R6. *[Violation Risk Factor: Lower; Time-Horizon: Long-term Planning]*

7.1. If a Transmission station or Transmission substation previously identified under Requirements R1 and R5 and verified according to Requirement R6 is removed from the identification during a subsequent risk assessment performed according to Requirement R5 or a verification according to Requirement R6, then the Transmission Owner shall, within seven calendar days following the verification or the subsequent risk assessment, notify the Transmission Operator that has operational control of the primary control center of the removal.

M7. Examples of acceptable evidence may include, but are not limited to, written or electronic notifications or communications that the Transmission Owner notified each Transmission Operator, as applicable, according to Requirement R7.

R8. Each Transmission Owner that identified a Transmission station, Transmission substation, or a primary control center in Requirement R5 and verified according to Requirement R6, and each Transmission Operator notified by a Transmission Owner according to Requirement R7, shall conduct an evaluation of the potential threats and vulnerabilities of a physical attack to each of their respective Transmission station(s), Transmission substation(s), and primary control center(s) identified in Requirement R5 and verified according to Requirement R6. The evaluation shall consider the following: *[Violation Risk Factor: Medium; Time-Horizon: Operations Planning, Long-term Planning]*

8.1. Unique characteristics of the identified and verified Transmission station(s), Transmission substation(s), and primary control center(s);

8.2. Prior history of attack(s) on similar facilities taking into account the frequency, geographic proximity, and severity of past physical security related events; and

8.3. Intelligence or threat warnings received from sources such as law enforcement, the Electric Reliability Organization (ERO), the Electricity Sector Information Sharing and Analysis Center (E-ISAC), U.S. federal and/or Canadian governmental agencies, or their successors.

M8. Examples of evidence may include, but are not limited to, dated written or electronic documentation that the Transmission Owner or Transmission Operator conducted an evaluation of the potential threats and vulnerabilities of a physical attack to their respective Transmission station(s), Transmission substation(s), and primary control center(s) as specified in Requirement R8.

R9. Each Transmission Owner that identified a Transmission station, Transmission substation, or primary control center in Requirement R5 and verified according to Requirement R6, and each Transmission Operator notified by a Transmission Owner according to Requirement R7, shall develop and implement a documented physical security plan(s) that covers their respective Transmission station(s), Transmission substation(s), and primary control center(s). The physical security plan(s) shall be developed within 120 calendar days following the completion of Requirement R6 and executed according to the timeline specified in the physical security plan(s). The physical security plan(s) shall include the following attributes: [*Violation Risk Factor*: *High; Time-Horizon: Long-term Planning*]

9.1. Resiliency or security measures designed collectively to deter, detect, delay, assess, communicate, and respond to potential physical threats and vulnerabilities identified during the evaluation conducted in Requirement R8.

9.2. Law enforcement contact and coordination information.

9.3. A timeline for executing the physical security enhancements and modifications specified in the physical security plan.

9.4. Provisions to evaluate evolving physical threats, and their corresponding security measures, to the Transmission station(s), Transmission substation(s), or primary control center(s).

M9. Examples of evidence may include, but are not limited to, dated written or electronic documentation of its physical security plan(s) that covers their respective identified and verified Transmission station(s), Transmission substation(s), and primary control center(s) as specified in Requirement R6, and additional evidence demonstrating execution of the physical security plan according to the timeline specified in the physical security plan.

R10. Each Transmission Owner that identified a Transmission station, Transmission substation, or primary control center in Requirement R5 and verified according to Requirement R6, and each Transmission Operator notified by a Transmission Owner according to Requirement R7, shall have an unaffiliated third party review the evaluation performed under Requirement R8 and the security plan(s) developed under Requirement R9. The review may occur concurrently with or after completion of the evaluation performed under Requirement R8 and the security plan development under Requirement R9. *[Violation Risk Factor: Medium; Time-Horizon: Long-term Planning]*

10.1. Each Transmission Owner and Transmission Operator shall select an unaffiliated third-party reviewer from the following:

- An entity or organization with electric industry physical security experience and whose review staff has at least one member who holds either a Certified Protection Professional (CPP) or Physical Security Professional (PSP) certification;
- An entity or organization approved by the ERO;
- A governmental agency with physical security expertise; or
- An entity or organization with demonstrated law enforcement, government, or military physical security expertise.

10.2. The Transmission Owner or Transmission Operator, respectively, shall ensure that the unaffiliated third-party review is completed within 90 calendar days of completing the security plan(s) developed in Requirement R9. The unaffiliated third-party review may, but is not required to, include recommended changes to the evaluation performed under Requirement R8 or the security plan(s) developed under Requirement R9.

10.3. If the unaffiliated third-party reviewer recommends changes to the evaluation performed under Requirement R8 or security plan(s) developed under Requirement R9, the Transmission Owner or Transmission Operator shall, within

60 calendar days of the completion of the unaffiliated third party review, for each recommendation:

- Modify its evaluation or security plan(s) consistent with the recommendation; or
- Document the reason(s) for not modifying the evaluation or security plan(s) consistent with the recommendation.

10.4. Each Transmission Owner and Transmission Operator shall implement procedures, such as the use of non-disclosure agreements, for protecting sensitive or confidential information made available to the unaffiliated third-party reviewer and to protect or exempt sensitive or confidential information developed pursuant to this Reliability Standard from public disclosure.

M10. Examples of evidence may include, but are not limited to, written or electronic documentation that the Transmission Owner or Transmission Operator had an unaffiliated third party review the evaluation performed under Requirement R8 and the security plan(s) developed under Requirement R9 as specified in Requirement R10 including, if applicable, documenting the reasons for not modifying the evaluation or security plan(s) in accordance with a recommendation under Part 10.3. Additionally, examples of evidence may include, but are not limited to, written or electronic documentation of procedures to protect information under Part 10.4.

C. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority: "Compliance Enforcement Authority" means NERC or the Regional Entity in their respective roles of monitoring and enforcing compliance with the NERC Reliability Standards.

1.2. Evidence Retention: The following evidence retention period(s) identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the Compliance Enforcement Authority may ask an entity to provide other evidence to show that it was compliant for the full-time period since the last audit.

The Transmission Owner and Transmission Operator shall keep data or evidence to show compliance, as identified below, unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation:

The responsible entities shall retain evidence, as per Requirements R1 through R10, for three years.

If a Responsible Entity is found non-compliant, it shall keep information related to the non-compliance until mitigation is complete and approved, or for the time specified above, whichever is longer.

The CEA shall keep the last audit records and all requested and submitted subsequent audit records.

1.3. Compliance Monitoring and Enforcement Program: "Compliance Monitoring Enforcement Program" or "CMEP" means, depending on the context (1) the NERC Compliance Monitoring and Enforcement Program (Appendix 4C to the NERC Rules of Procedure) or the Commission-approved program of a Regional Entity, as applicable, or (2) the program, department or organization within NERC or a Regional Entity that is responsible for performing compliance monitoring and enforcement activities with respect to Registered Entities' compliance with Reliability Standards.

Violation Severity Levels

	Violation Severity Levels			
	Lower VSL	**Moderate VSL**	**High VSL**	**Severe VSL**
R1.	The Transmission Owner identified each applicable Transmission station(s) and Transmission substation(s) per Attachment 1, but did so after 36 calendar months, but less than or equal to 38 calendar months. OR The Transmission Owner identified each applicable Transmission station(s) and Transmission substation(s), but failed to identify less than or equal to 10% of the applicable Transmission station(s) and Transmission substation(s) per Attachment 1.	The Transmission Owner identified each applicable Transmission station(s) and Transmission substation(s) per Attachment 1, but did so after 38 calendar months, but less than or equal to 40 calendar months. OR The Transmission Owner identified each applicable Transmission station(s) and Transmission substation(s), but failed to identify more than 10% and less than or equal to 20% of the applicable Transmission station(s) and Transmission substation(s) per Attachment 1.	The Transmission Owner identified each applicable Transmission station(s) and Transmission substation(s) per Attachment 1, but did so after 40 calendar months, but less than or equal to 42 calendar months. OR The Transmission Owner identified each applicable Transmission station(s) and Transmission substation(s), but failed to identify more than 20% and less than or equal to 30% of the applicable Transmission station(s) and Transmission substation(s) per Attachment 1.	The Transmission Owner failed to identify each applicable Transmission station(s) and Transmission substation(s) per Attachment 1. OR The Transmission Owner identified each applicable Transmission station(s) and Transmission substation(s) per Attachment 1, but did so after more than 42 calendar months. OR The Transmission Owner identified each applicable Transmission station(s) and Transmission substation(s), but failed to identify more than 30% of the applicable Transmission station(s) and Transmission substation(s) per Attachment 1.

	Violation Severity Levels			
	Lower VSL	Moderate VSL	High VSL	Severe VSL
R2.	N/A	N/A	N/A	The Transmission Owner with applicable Transmission station(s) or Transmission substation(s) identified in Requirement R1 did not identify existing BES Transmission station(s) and BES Transmission substation(s), irrespective of ownership, within 1500 feet or 457 meters (the shortest distance, measured substation fence line to substation fence line) of an applicable Transmission station or Transmission substation identified in Requirement R1.
R3.	N/A	The Transmission Owner has a risk assessment methodology that failed to include one of the requirements listed in Parts 3.1 through 3.3.	The Transmission Owner has a risk assessment methodology that failed to include two of the requirements listed in Parts 3.1 through 3.3.	The Transmission Owner has a risk assessment methodology that failed to include all three of the requirements listed in Parts 3.1 through 3.3. OR The Transmission Owner does not have a risk assessment methodology.

	Violation Severity Levels			
	Lower VSL	Moderate VSL	High VSL	Severe VSL
R4.	The Transmission Owner with applicable Transmission station(s) and Transmission substation(s) identified in Requirement R1 owned by multiple Transmission Owners failed to coordinate with each appropriate Transmission Owner(s) to determine and document their individual and joint responsibilities for documenting a risk assessment methodology under Requirement R3 and for performing any required risk assessments per Requirement R5 for less than or equal to 25% of jointly owned applicable Transmission station(s) and Transmission substation(s).	The Transmission Owner with applicable Transmission station(s) and Transmission substation(s) identified in Requirement R1 owned by multiple Transmission Owners failed to coordinate with each appropriate Transmission Owner(s) to determine and document their individual and joint responsibilities for documenting a risk assessment methodology under Requirement R3 and for performing any required risk assessments per Requirement R5 for more than 25% and less than or equal to 50% of jointly owned applicable Transmission station(s) and Transmission substation(s).	The Transmission Owner with applicable Transmission station(s) and Transmission substation(s) identified in Requirement owned by multiple Transmission Owners failed to coordinate with each appropriate Transmission Owner(s) to determine and document their individual and joint responsibilities for documenting a risk assessment methodology under Requirement R3 and for performing any required risk assessments per Requirement R5 for more than 50% and less than or equal to 75% of jointly owned applicable Transmission station(s) and Transmission substation(s).	The Transmission Owner with applicable Transmission station(s) and Transmission substation(s) identified in Requirement R1 owned by multiple Transmission Owners failed to coordinate with each appropriate Transmission Owner(s) to determine and document their individual and joint responsibilities for documenting a risk assessment methodology under Requirement R3 and for performing any required risk assessments per Requirement R5 for more than 75% and less than or equal to 100% of any evidence for jointly owned applicable Transmission station(s) and Transmission substation(s).
R5.	The Transmission Owner performed a risk assessment, but did so after 36 calendar months, but less than or equal to 38 calendar months.	The Transmission Owner performed a risk assessment, but did so after 38 calendar months, but less than or equal to 40 calendar months. OR	The Transmission Owner performed a risk assessment, but did so after 40 calendar months, but less than or equal to 42 calendar months. OR	The Transmission Owner performed a risk assessment, but did so after more than 42 calendar months. OR

	Violation Severity Levels			
	Lower VSL	Moderate VSL	High VSL	Severe VSL
		The Transmission Owner performed a risk assessment inconsistent with one of the methodology requirements listed in Requirement R3, Parts 3.1 through 3.3.	The Transmission Owner performed a risk assessment inconsistent with two of the methodology requirements listed in Requirement R3, Parts 3.1 through 3.3. OR The Transmission Owner performed a risk assessment, but failed to include the primary control center identified in Part 5.2.	The Transmission Owner performed a risk assessment inconsistent with all three of the methodology requirements listed in Requirement R3, Parts 3.1 through 3.3.
R6.	The Transmission Owner had an unaffiliated third party verify the risk assessment performed under Requirement R5, but did so in more than 90 calendar days, but less than or equal to 100 calendar days following completion of Requirement R5. OR The Transmission Owner had an unaffiliated third party verify the risk assessment performed under Requirement R5 and modified or documented the technical basis	The Transmission Owner had an unaffiliated third party verify the risk assessment performed under Requirement R5, but did so more than 100 calendar days, but less than or equal to 110 calendar days following completion of Requirement R5. OR The Transmission Owner had an unaffiliated third party verify the risk assessment performed under Requirement R5 and modified or documented the technical basis for not modifying its identification	The Transmission Owner had an unaffiliated third party verify the risk assessment performed under Requirement R5, but did so more than 110 calendar days, but less than or equal to 120 calendar days following completion of Requirement R5. OR The Transmission Owner had an unaffiliated third party verify the risk assessment performed under Requirement R5 and modified or documented the technical basis	The Transmission Owner had an unaffiliated third party verify the risk assessment performed under Requirement R5, but did so more than 120 calendar days following completion of Requirement R5. OR The Transmission Owner failed to have an unaffiliated third party verify the risk assessment performed under Requirement R5. OR

	Violation Severity Levels			
	Lower VSL	Moderate VSL	High VSL	Severe VSL
	for not modifying its identification under Requirement R5 as required by Part6.3, but did so more than 60 calendar days and less than or equal to 70 calendar days from completion of the third party verification.	under Requirement R5 as required by Part 6.3, but did so more than 70 calendar days and less than or equal to 80 calendar days from completion of the third party verification.	for not modifying its identification under Requirement R5 as required by Part 6.3, but did so more than 80 calendar days from completion of the third party verification. OR The Transmission Owner had an unaffiliated third party verify the risk assessment performed under Requirement R5, but failed to modify or document the technical basis for not modifying its identification under R4 as required by Part 6.3.	The Transmission Owner had an unaffiliated third party verify the risk assessment performed under Requirement R5, but failed to implement procedures for protecting information per Part 6.4.
R7.	The Transmission Owner notified the Transmission Operator that operates the primary control center as specified in Requirement R7, but did so more than seven calendar days and less than or equal to nine calendar days following the completion of Requirement R6. OR	The Transmission Owner notified the Transmission Operator that operates the primary control center as specified in Requirement R7, but did so more than nine calendar days and less than or equal to 11 calendar days following the completion of Requirement R6. OR	The Transmission Owner notified the Transmission Operator that operates the primary control center as specified in Requirement R7, but did so more than 11 calendar days and less than or equal to 13 calendar days following the completion of Requirement R6. OR	The Transmission Owner notified the Transmission Operator that operates the primary control center as specified in Requirement R7, but did so more than 13 calendar days following the completion of Requirement R6. OR The Transmission Owner failed to notify the Transmission

	Violation Severity Levels			
	Lower VSL	Moderate VSL	High VSL	Severe VSL
	The Transmission Owner notified the Transmission Operator that operates the primary control center of the removal from the identification in Requirement R5, but did so more than seven calendar days and less than or equal to nine calendar days following the verification or the subsequent risk assessment.	The Transmission Owner notified the Transmission Operator that operates the primary control center of the removal from the identification in Requirement R5, but did so more than nine calendar days and less than or equal to 11 calendar days following the verification or the subsequent risk assessment.	The Transmission Owner notified the Transmission Operator that operates the primary control center of the removal from the identification in Requirement R5, but did so more than 11 calendar days and less than or equal to 13 calendar days following the verification or the subsequent risk assessment.	Operator that it operates a control center identified in Requirement R5. OR The Transmission Owner notified the Transmission Operator that operates the primary control center of the removal from the identification in Requirement R5, but did so more than 13 calendar days following the verification or the subsequent risk assessment. OR The Transmission Owner failed to notify the Transmission Operator that operates the primary control center of the removal from the identification in Requirement R5.

	Violation Severity Levels			
	Lower VSL	Moderate VSL	High VSL	Severe VSL
R8.	N/A	The responsible entity conducted an evaluation of the potential physical threats and vulnerabilities to each of its Transmission station(s), Transmission substation(s), and primary control center(s) identified in Requirement R5, but failed to consider one of Parts 8.1 through 8.3 in the evaluation.	The responsible entity conducted an evaluation of the potential physical threats and vulnerabilities to each of its Transmission station(s), Transmission substation(s), and primary control center(s) identified in Requirement R5, but failed to consider two of Parts 8.1 through 8.3 in the evaluation.	The responsible entity failed to conduct an evaluation of the potential physical threats and vulnerabilities to each of its Transmission station(s), Transmission substation(s), and primary control center(s) identified in Requirement R5. OR The responsible entity conducted an evaluation of the potential physical threats and vulnerabilities to each of its Transmission station(s), Transmission substation(s), and primary control center(s) identified in Requirement R5, but failed to consider Parts 8.1 through 8.3.

	Violation Severity Levels			
	Lower VSL	Moderate VSL	High VSL	Severe VSL
R9.	The responsible entity developed and implemented a documented physical security plan(s) that covers each of its Transmission station(s), Transmission substation(s), and primary control center(s) identified in Requirement R5, but did so more than 120 calendar days, but less than or equal to 130 calendar days after completing Requirement R6. OR The responsible entity developed and implemented a documented physical security plan(s) that covers its Transmission station(s), Transmission substation(s), and primary control center(s) identified in Requirement R5 and verified according to Requirement R6, but failed to include one of Parts 9.1 through 9.4 in the plan.	The responsible entity developed and implemented a documented physical security plan(s) that covers each of its Transmission station(s), Transmission substation(s), and primary control center(s) identified in Requirement R5, but did so more than 130 calendar days, but less than or equal to 140 calendar days after completing Requirement R6. OR The responsible entity developed and implemented a documented physical security plan(s) that covers its Transmission station(s), Transmission substation(s), and primary control center(s) identified in Requirement R5 and verified according to Requirement R6, but failed to include two of Parts 9.1 through 9.4 in the plan.	The responsible entity developed and implemented a documented physical security plan(s) that covers each of its Transmission station(s), Transmission substation(s), and primary control center(s) identified in Requirement R5, but did so more than 140 calendar days, but less than or equal to 150 calendar days after completing Requirement R6. OR The responsible entity developed and implemented a documented physical security plan(s) that covers its Transmission station(s), Transmission substation(s), and primary control center(s) identified in Requirement R5 and verified according to Requirement R6, but failed to include three of Parts 9.1 through 9.4 in the plan. Attachment 1 – Applicability Criteria

Applicable Transmission station(s) or Transmission substation(s) are those that meet any of the following criteria:

1. Transmission Facilities operated at 500 kV or higher. For the purpose of this criterion, the collector bus for a generation plant is not considered a Transmission Facility, but is part of the generation interconnection Facility.

2. Transmission Facilities that are operating between 200 kV and 499 kV at a single station or substation, where the station or substation is connected at 200 kV or higher voltages to three or more other Transmission stations or substations and has an "aggregate weighted value" exceeding 3,000 according to the table below. The "aggregate weighted value" for a single station or substation is determined by summing the "weight value per line" shown in the table below for each incoming and each outgoing BES Transmission Line that is connected to another Transmission station or substation. For the purpose of this criterion, the collector bus for a generation plant is not considered a Transmission Facility, but is part of the generation interconnection Facility.

Voltage Value of a Line	Weight Value per Line
less than 200 kV (not applicable)	(not applicable)
200 kV to 299 kV	700
300 kV to 499 kV	1,300
500 kV and above	N/A

3. Transmission Facilities at a single station or substation location that are identified by their Reliability Coordinator, Planning Coordinator, or Transmission Planner as critical to the derivation of Interconnection Reliability Operating Limits (IROLs) and their associated contingencies.

4. Transmission Facilities identified as essential to meeting Nuclear Plant Interface Requirements (NPIRs).

Standard Development Timeline

This section is maintained by the drafting team during the development of the standard and will be removed when the standard is adopted by the NERC Board of Trustees (Board).

Description of Current Draft

CIP-014-4 is posted for a 45-day formal comment period with additional ballot.

Completed Actions	Date
Standards Committee approved Standard Authorization Request for posting	June 21, 2023
Standard Authorization Request posted for comment	July 26 – August 24, 2023
Accepted Revised Standard Authorization Request	January 17, 2024
45-day formal or informal comment period with ballot	May 20 – July 3, 2024
45-day formal or informal comment period with additional ballot	September 23 – November 6, 2024
45-day formal comment period with additional ballot	June 6 – July 21, 2025
45-day formal comment period with additional ballot	March 31 – May 14, 2026

Anticipated Actions	Date
10-day final ballot	May 28 – June 8, 2026
Board adoption	June 17, 2026

New or Modified Term(s) Used in NERC Reliability Standards

This section includes all new or modified terms used in the proposed standard that will be included in the *Glossary of Terms Used in NERC Reliability Standards* upon applicable regulatory approval. Terms used in the proposed standard that are already defined and are not being modified can be found in the *Glossary of Terms Used in NERC Reliability Standards*. The new or revised terms listed below will be presented for approval along with the proposed standard. Upon Board adoption, this section will be removed.

Term(s):

None.

A. Introduction

1. **Title:** Physical Security

2. **Number:** CIP-014-4

3. **Purpose:** To identify and protect Transmission stations and Transmission substations, and their associated primary control centers, that if rendered inoperable or damaged due to a physical attack, could result in instability, uncontrolled separation, or Cascading within an Interconnection.

4. **Applicability:**

   4.1. Functional Entities:

   4.1.1. Transmission Owner that owns or jointly owns one or more Transmission stations or Transmission substations that meet the applicability criteria of Attachment 1.

   4.1.2. Transmission Operator

   Exemption: Facilities in a "protected area," as defined in 10 C.F.R. § 73.2, within the scope of a security plan approved or accepted by the Nuclear Regulatory Commission are not subject to this Standard; or Facilities within the scope of a security plan approved or accepted by the Canadian Nuclear Safety Commission are not subject to this Reliability Standard.

5. **Effective Date:** See Implementation Plan for CIP-014-4.

B. Requirements and Measures

R1. Each Transmission Owner shall, at least once every 36 calendar months, identify each applicable Transmission station and Transmission substation meeting any of the criteria in Attachment 1 that is either existing or planned to be in service within 36 calendar months. *[Violation Risk Factor: High; Time-Horizon: Long-term Planning]*

M1. Examples of evidence may include, but are not limited to, dated written or electronic documentation of the Transmission station(s) and Transmission substation(s) (existing and those planned to be in service within 36 calendar months) that meet any of the criteria in Attachment 1.

R2. Each Transmission Owner with applicable Transmission station(s) or Transmission substation(s) identified in Requirement R1 shall identify proximate existing Bulk Electric System (BES) Transmission station(s) and ~~Bulk Electric System~~BES Transmission substation(s), irrespective of ownership, within 1500 feet or 457 meters (the shortest distance, measured substation fence line to substation fence line) of an applicable Transmission station or Transmission substation identified in Requirement R1. *[Violation Risk Factor: Medium; Time-Horizon: Long-term Planning]*

M2. Examples of evidence may include, but are not limited to, dated written or electronic documentation of the ~~Bulk Electric System~~BES Transmission stations or ~~Bulk Electric System~~BES Transmission substations identified in Requirement R2.

R3. Each Transmission Owner shall have a documented risk assessment methodology for evaluating the loss of each applicable Transmission station or Transmission substation identified in Requirement R1. The methodology shall include, at a minimum, the following: *[Violation Risk Factor: High; Time-Horizon: Long-term Planning]*

3.1. Documented criteria for assessing instability, uncontrolled separation, or Cascading within an Interconnection. The criteria shall include, at a minimum, technically justified thresholds identifying unacceptable generation and load loss within an Interconnection.

3.2. A provision that steady-state and dynamic simulations shall each be performed using at a minimum one System peak Load case and one System Off-Peak Load case.

3.3. Specifications for simulations at each applicable Transmission station or Transmission substation identified in accordance with Requirement R1 and, if applicable, at each associated proximate existing ~~Bulk Electric System~~BES Transmission station(s) and ~~Bulk Electric System~~BES Transmission substation(s) identified in accordance with Requirement R2, that include:

3.3.1. At the applicable Transmission station or Transmission substation:

3.3.1.1. Prior loss of communication and Protection Systems;

3.3.1.2. Application of a Fault or Faults; and

3.3.1.3. Delayed (remote) clearing times shall be used unless otherwise technically substantiated.

3.3.2. At each proximate existing ~~Bulk Electric System Transmission~~BES station(s) and ~~Bulk Electric System Transmission~~BES substation(s), as applicable:

3.3.2.1. Application of a Fault or Faults, either simultaneous with or following the Fault or Faults applied under Part 3.3.1.2; and

3.3.2.2. Normal clearing times shall be used unless otherwise technically substantiated.

3.3.3. A documented justification for the Fault(s) associated with physical attack to be simulated. A single justification may be used for multiple locations. The justification shall include at a minimum:

3.3.3.1. The type of credible high-severity physical attack considered; and

3.3.3.2. The type of Fault(s) selected based upon the attack considered.

3.3.4. Removal of all Elements that Protection Systems and other controls are expected to automatically disconnect.

3.3.5. Actual or more conservative clearing times shall be used.

M3. Each Transmission Owner shall provide dated evidence, such as electronic or hard copies, of a risk assessment methodology satisfying Requirement R3.

R4. Each Transmission Owner with applicable Transmission station(s) and Transmission substation(s) identified in Requirement R1 jointly owned by multiple Transmission Owners shall coordinate with each appropriate Transmission Owner(s) to determine and document their individual and joint responsibilities under Requirement R3 and Requirement R5. *[Violation Risk Factor: Medium; Time-Horizon: Operations Planning, Long-term Planning]*

M4. Examples of acceptable evidence may include, but are not limited to, dated documentation, such as meeting minutes, agreements, and email correspondence, that identifies that agreement has been reached on individual and joint responsibilities for performing the required risk assessments.

R5. At least once every 36 calendar months, each Transmission Owner shall perform a risk assessment to identify applicable Transmission station(s) and Transmission substation(s) identified in Requirement R1, that if rendered inoperable or damaged could result in instability, uncontrolled separation, or Cascading within an Interconnection, using the methodology established in Requirement R3. Jointly owned Transmission station(s) and Transmission substation(s) shall be assessed according to the responsibilities documented under Requirement R4. If proximate ~~Bulk Electric System Transmission~~BES station(s) and ~~Bulk Electric System~~BES Transmission substation(s) were identified in Requirement R2, they shall be included

in the risk assessment according to Requirement R3, Part 3.3. *[Violation Risk Factor: High; Time-Horizon: Operations Planning, Long-term Planning]*

5.1. If during a risk assessment, a Transmission station or Transmission substation is identified in either the dynamic or steady-state simulation as ~~causing~~ resulting in instability, uncontrolled separation, or Cascading within an Interconnection when rendered inoperable or damaged, then no further simulation is required.

5.2. If a previous risk assessment has identified a Transmission station or Transmission substation as causing instability, uncontrolled separation, or Cascading within an Interconnection when rendered inoperable or damaged, then the Transmission Owner may forgo additional assessments on that Transmission station or Transmission substation. Requirement R5, Part 5.3 and Requirement R7 through Requirement R10 still apply to that Transmission station or Transmission substation until a new risk assessment demonstrates otherwise.

5.3. The Transmission Owner shall identify the primary control center that operationally controls each Transmission station or Transmission substation identified as ~~causing~~ resulting in instability, uncontrolled separation, or Cascading within an Interconnection when rendered inoperable or damaged in the Requirement R5 risk assessment.

M5. Examples of acceptable evidence may include, but are not limited to, dated written or electronic documentation of the risk assessment satisfying Requirement R5 including the identified Transmission station(s) or Transmission substation(s). For Requirement R5, Part 5.3, examples of acceptable evidence may include, but are not limited to, dated written or electronic documentation of the identification of the primary control center that operationally controls each identified Transmission station or Transmission substation.

R6. Each Transmission Owner shall have an unaffiliated third party verify the risk assessment performed under Requirement R5. The verification may occur concurrently with or after the risk assessment performed under Requirement R5. *[Violation Risk Factor: Medium; Time-Horizon: Long-term Planning]*

6.1. Each Transmission Owner shall select an unaffiliated verifying entity that is either:

- A registered Planning Coordinator, Transmission Planner, or Reliability Coordinator; or
- An entity that has transmission planning or analysis experience.

6.2. The unaffiliated third-party verification shall verify the Transmission Owner's risk assessment performed under Requirement R5, which may include recommendations for the addition or deletion of a Transmission station(s) or Transmission substation(s). The Transmission Owner shall ensure the verification

is completed within 90 calendar days following the completion of the Requirement R5 risk assessment.

6.3. If the unaffiliated verifying entity recommends that the Transmission Owner add a Transmission station(s) or Transmission substation(s) to, or remove a Transmission station or Transmission substation from, its identification under Requirement R5, the Transmission Owner shall either, within 60 calendar days of completion of the verification, for each recommended addition or removal of a Transmission station or Transmission substation:

- Modify its identification under Requirement R5 consistent with the recommendation; or
- Document the technical basis for not modifying the identification in accordance with the recommendation.

6.4. Each Transmission Owner shall implement procedures, such as the use of non-disclosure agreements, for protecting sensitive or confidential information made available to the unaffiliated third-party verifier and to protect or exempt sensitive or confidential information developed pursuant to this Reliability Standard from public disclosure.

M6. Examples of acceptable evidence may include, but are not limited to, dated written or electronic documentation that the Transmission Owner completed an unaffiliated third party verification of the Requirement R5 risk assessment and satisfied all of the applicable provisions of Requirement R6, including, if applicable, documenting the technical basis for not modifying the identification in Requirements R1, R2, R3, R4, and R5 as specified under Part 6.3. Additionally, examples of evidence may include, but are not limited to, written or electronic documentation of procedures to protect information under Part 6.4.

R7. For a primary control center(s) identified by the Transmission Owner according to Requirement R5, Part 5.3 that a) operationally controls an identified Transmission station or Transmission substation verified according to Requirement R6, and b) is not under the operational control of the Transmission Owner: the Transmission Owner shall, within seven calendar days following completion of Requirement R6, notify the Transmission Operator that has operational control of the primary control center of such identification and the date of completion of Requirement R6. *[Violation Risk Factor: Lower; Time-Horizon: Long-term Planning]*

7.1. If a Transmission station or Transmission substation previously identified under Requirements R1 and R5 and verified according to Requirement R6 is removed from the identification during a subsequent risk assessment performed according to Requirement R5 or a verification according to Requirement R6, then the Transmission Owner shall, within seven calendar days following the verification or the subsequent risk assessment, notify the Transmission Operator that has operational control of the primary control center of the removal.

M7. Examples of acceptable evidence may include, but are not limited to, written or electronic notifications or communications that the Transmission Owner notified each Transmission Operator, as applicable, according to Requirement R7.

R8. Each Transmission Owner that identified a Transmission station, Transmission substation, or a primary control center in Requirement R5 and verified according to Requirement R6, and each Transmission Operator notified by a Transmission Owner according to Requirement R7, shall conduct an evaluation of the potential threats and vulnerabilities of a physical attack to each of their respective Transmission station(s), Transmission substation(s), and primary control center(s) identified in Requirement R5 and verified according to Requirement R6. The evaluation shall consider the following: *[Violation Risk Factor: Medium; Time-Horizon: Operations Planning, Long-term Planning]*

8.1. Unique characteristics of the identified and verified Transmission station(s), Transmission substation(s), and primary control center(s);

8.2. Prior history of attack(s) on similar facilities taking into account the frequency, geographic proximity, and severity of past physical security related events; and

8.3. Intelligence or threat warnings received from sources such as law enforcement, the Electric Reliability Organization (ERO), the Electricity Sector Information Sharing and Analysis Center (E-ISAC), U.S. federal and/or Canadian governmental agencies, or their successors.

M8. Examples of evidence may include, but are not limited to, dated written or electronic documentation that the Transmission Owner or Transmission Operator conducted an evaluation of the potential threats and vulnerabilities of a physical attack to their respective Transmission station(s), Transmission substation(s), and primary control center(s) as specified in Requirement R8.

R9. Each Transmission Owner that identified a Transmission station, Transmission substation, or primary control center in Requirement R5 and verified according to Requirement R6, and each Transmission Operator notified by a Transmission Owner according to Requirement R7, shall develop and implement a documented physical security plan(s) that covers their respective Transmission station(s), Transmission substation(s), and primary control center(s). The physical security plan(s) shall be developed within 120 calendar days following the completion of Requirement R6 and executed according to the timeline specified in the physical security plan(s). The physical security plan(s) shall include the following attributes: [*Violation Risk Factor*: *High; Time-Horizon: Long-term Planning*]

9.1. Resiliency or security measures designed collectively to deter, detect, delay, assess, communicate, and respond to potential physical threats and vulnerabilities identified during the evaluation conducted in Requirement R8.

9.2. Law enforcement contact and coordination information.

9.3. A timeline for executing the physical security enhancements and modifications specified in the physical security plan.

9.4. Provisions to evaluate evolving physical threats, and their corresponding security measures, to the Transmission station(s), Transmission substation(s), or primary control center(s).

M9. Examples of evidence may include, but are not limited to, dated written or electronic documentation of its physical security plan(s) that covers their respective identified and verified Transmission station(s), Transmission substation(s), and primary control center(s) as specified in Requirement R6, and additional evidence demonstrating execution of the physical security plan according to the timeline specified in the physical security plan.

R10. Each Transmission Owner that identified a Transmission station, Transmission substation, or primary control center in Requirement R5 and verified according to Requirement R6, and each Transmission Operator notified by a Transmission Owner according to Requirement R7, shall have an unaffiliated third party review the evaluation performed under Requirement R8 and the security plan(s) developed under Requirement R9. The review may occur concurrently with or after completion of the evaluation performed under Requirement R8 and the security plan development under Requirement R9. *[Violation Risk Factor: Medium; Time-Horizon: Long-term Planning]*

10.1. Each Transmission Owner and Transmission Operator shall select an unaffiliated third-party reviewer from the following:

- An entity or organization with electric industry physical security experience and whose review staff has at least one member who holds either a Certified Protection Professional (CPP) or Physical Security Professional (PSP) certification;
- An entity or organization approved by the ERO;
- A governmental agency with physical security expertise; or
- An entity or organization with demonstrated law enforcement, government, or military physical security expertise.

10.2. The Transmission Owner or Transmission Operator, respectively, shall ensure that the unaffiliated third-party review is completed within 90 calendar days of completing the security plan(s) developed in Requirement R9. The unaffiliated third-party review may, but is not required to, include recommended changes to the evaluation performed under Requirement R8 or the security plan(s) developed under Requirement R9.

10.3. If the unaffiliated third-party reviewer recommends changes to the evaluation performed under Requirement R8 or security plan(s) developed under

Requirement R9, the Transmission Owner or Transmission Operator shall, within 60 calendar days of the completion of the unaffiliated third party review, for each recommendation:

- Modify its evaluation or security plan(s) consistent with the recommendation; or
- Document the reason(s) for not modifying the evaluation or security plan(s) consistent with the recommendation.

10.4. Each Transmission Owner and Transmission Operator shall implement procedures, such as the use of non-disclosure agreements, for protecting sensitive or confidential information made available to the unaffiliated third-party reviewer and to protect or exempt sensitive or confidential information developed pursuant to this Reliability Standard from public disclosure.

M10. Examples of evidence may include, but are not limited to, written or electronic documentation that the Transmission Owner or Transmission Operator had an unaffiliated third party review the evaluation performed under Requirement R8 and the security plan(s) developed under Requirement R9 as specified in Requirement R10 including, if applicable, documenting the reasons for not modifying the evaluation or security plan(s) in accordance with a recommendation under Part 10.3. Additionally, examples of evidence may include, but are not limited to, written or electronic documentation of procedures to protect information under Part 10.4.

C. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority: "Compliance Enforcement Authority" means NERC or the Regional Entity in their respective roles of monitoring and enforcing compliance with the NERC Reliability Standards.

1.2. Evidence Retention: The following evidence retention period(s) identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the Compliance Enforcement Authority may ask an entity to provide other evidence to show that it was compliant for the full-time period since the last audit.

The Transmission Owner and Transmission Operator shall keep data or evidence to show compliance, as identified below, unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation:

The responsible entities shall retain evidence, as per Requirements R1 through R10, for three years.

If a Responsible Entity is found non-compliant, it shall keep information related to the non-compliance until mitigation is complete and approved, or for the time specified above, whichever is longer.

The CEA shall keep the last audit records and all requested and submitted subsequent audit records.

1.3. Compliance Monitoring and Enforcement Program: "Compliance Monitoring Enforcement Program" or "CMEP" means, depending on the context (1) the NERC Compliance Monitoring and Enforcement Program (Appendix 4C to the NERC Rules of Procedure) or the Commission-approved program of a Regional Entity, as applicable, or (2) the program, department or organization within NERC or a Regional Entity that is responsible for performing compliance monitoring and enforcement activities with respect to Registered Entities' compliance with Reliability Standards.

Violation Severity Levels

	Violation Severity Levels			
	Lower VSL	**Moderate VSL**	**High VSL**	**Severe VSL**
R1.	The Transmission Owner identified each applicable Transmission station(s) and Transmission substation(s) per Attachment 1, but did so after 36 calendar months, but less than or equal to 38 calendar months. OR The Transmission Owner identified each applicable Transmission station(s) and Transmission substation(s), but failed to identify less than or equal to 10% of the applicable Transmission station(s) and Transmission substation(s) per Attachment 1.	The Transmission Owner identified each applicable Transmission station(s) and Transmission substation(s) per Attachment 1, but did so after 38 calendar months, but less than or equal to 40 calendar months. OR The Transmission Owner identified each applicable Transmission station(s) and Transmission substation(s), but failed to identify more than 10% and less than or equal to 20% of the applicable Transmission station(s) and Transmission substation(s) per Attachment 1.	The Transmission Owner identified each applicable Transmission station(s) and Transmission substation(s) per Attachment 1, but did so after 40 calendar months, but less than or equal to 42 calendar months. OR The Transmission Owner identified each applicable Transmission station(s) and Transmission substation(s), but failed to identify more than 20% and less than or equal to 30% of the applicable Transmission station(s) and Transmission substation(s) per Attachment 1.	The Transmission Owner failed to identify each applicable Transmission station(s) and Transmission substation(s) per Attachment 1. OR The Transmission Owner identified each applicable Transmission station(s) and Transmission substation(s) per Attachment 1, but did so after more than 42 calendar months. OR The Transmission Owner identified each applicable Transmission station(s) and Transmission substation(s), but failed to identify more than 30% of the applicable Transmission station(s) and Transmission substation(s) per Attachment 1.

	Violation Severity Levels			
	Lower VSL	Moderate VSL	High VSL	Severe VSL
R2.	N/A	N/A	N/A	The Transmission Owner with applicable Transmission station(s) or Transmission substation(s) identified in Requirement R1 did not identify existing ~~Bulk Electric System~~BES Transmission station(s) and ~~Bulk Electric System~~BES Transmission substation(s), irrespective of ownership, within 1500 feet or 457 meters (the shortest distance, measured substation fence line to substation fence line) of an applicable Transmission station or Transmission substation identified in Requirement R1.
R3.	N/A	The Transmission Owner has a risk assessment methodology that failed to include one of the requirements listed in Parts 3.1 through 3.3.	The Transmission Owner has a risk assessment methodology that failed to include two of the requirements listed in Parts 3.1 through 3.3.	The Transmission Owner has a risk assessment methodology that failed to include all three of the requirements listed in Parts 3.1 through 3.3. OR The Transmission Owner does not have a risk assessment methodology.

	Violation Severity Levels			
	Lower VSL	Moderate VSL	High VSL	Severe VSL
R4.	The Transmission Owner with applicable Transmission station(s) and Transmission substation(s) identified in Requirement R1 owned by multiple Transmission Owners failed to coordinate with each appropriate Transmission Owner(s) to determine and document their individual and joint responsibilities for documenting a risk assessment methodology under Requirement R3 and for performing any required risk assessments per Requirement R5 for less than or equal to 25% of jointly owned applicable Transmission station(s) and Transmission substation(s).	The Transmission Owner with applicable Transmission station(s) and Transmission substation(s) identified in Requirement R1 owned by multiple Transmission Owners failed to coordinate with each appropriate Transmission Owner(s) to determine and document their individual and joint responsibilities for documenting a risk assessment methodology under Requirement R3 and for performing any required risk assessments per Requirement R5 for more than 25% and less than or equal to 50% of jointly owned applicable Transmission station(s) and Transmission substation(s).	The Transmission Owner with applicable Transmission station(s) and Transmission substation(s) identified in Requirement owned by multiple Transmission Owners failed to coordinate with each appropriate Transmission Owner(s) to determine and document their individual and joint responsibilities for documenting a risk assessment methodology under Requirement R3 and for performing any required risk assessments per Requirement R5 for more than 50% and less than or equal to 75% of jointly owned applicable Transmission station(s) and Transmission substation(s).	The Transmission Owner with applicable Transmission station(s) and Transmission substation(s) identified in Requirement R1 owned by multiple Transmission Owners failed to coordinate with each appropriate Transmission Owner(s) to determine and document their individual and joint responsibilities for documenting a risk assessment methodology under Requirement R3 and for performing any required risk assessments per Requirement R5 for more than 75% and less than or equal to 100% of any evidence for jointly owned applicable Transmission station(s) and Transmission substation(s).
R5.	The Transmission Owner performed a risk assessment, but did so after 36 calendar months, but less than or equal to 38 calendar months.	The Transmission Owner performed a risk assessment, but did so after 38 calendar months, but less than or equal to 40 calendar months. OR	The Transmission Owner performed a risk assessment, but did so after 40 calendar months, but less than or equal to 42 calendar months. OR	The Transmission Owner performed a risk assessment, but did so after more than 42 calendar months. OR

	Violation Severity Levels			
	Lower VSL	Moderate VSL	High VSL	Severe VSL
		The Transmission Owner performed a risk assessment inconsistent with one of the methodology requirements listed in Requirement R3, Parts 3.1 through 3.3.	The Transmission Owner performed a risk assessment inconsistent with two of the methodology requirements listed in Requirement R3, Parts 3.1 through 3.3. OR The Transmission Owner performed a risk assessment, but failed to include the primary control center identified in Part 5.2.	The Transmission Owner performed a risk assessment inconsistent with all three of the methodology requirements listed in Requirement R3, Parts 3.1 through 3.3.
R6.	The Transmission Owner had an unaffiliated third party verify the risk assessment performed under Requirement R5, but did so in more than 90 calendar days, but less than or equal to 100 calendar days following completion of Requirement R5. OR The Transmission Owner had an unaffiliated third party verify the risk assessment performed under Requirement R5 and modified or documented the technical basis	The Transmission Owner had an unaffiliated third party verify the risk assessment performed under Requirement R5, but did so more than 100 calendar days, but less than or equal to 110 calendar days following completion of Requirement R5. OR The Transmission Owner had an unaffiliated third party verify the risk assessment performed under Requirement R5 and modified or documented the technical basis for not modifying its identification	The Transmission Owner had an unaffiliated third party verify the risk assessment performed under Requirement R5, but did so more than 110 calendar days, but less than or equal to 120 calendar days following completion of Requirement R5. OR The Transmission Owner had an unaffiliated third party verify the risk assessment performed under Requirement R5 and modified or documented the technical basis	The Transmission Owner had an unaffiliated third party verify the risk assessment performed under Requirement R5, but did so more than 120 calendar days following completion of Requirement R5. OR The Transmission Owner failed to have an unaffiliated third party verify the risk assessment performed under Requirement R5. OR

Attachment 1 – Applicability Criteria

Applicable Transmission station(s) or Transmission substation(s) are those that meet any of the following criteria:

1. Transmission Facilities operated at 500 kV or higher. For the purpose of this criterion, the collector bus for a generation plant is not considered a Transmission Facility, but is part of the generation interconnection Facility.

2. Transmission Facilities that are operating between 200 kV and 499 kV at a single station or substation, where the station or substation is connected at 200 kV or higher voltages to three or more other Transmission stations or substations and has an "aggregate weighted value" exceeding 3,000 according to the table below. The "aggregate weighted value" for a single station or substation is determined by summing the "weight value per line" shown in the table below for each incoming and each outgoing ~~Bulk Electric System~~BES Transmission Line that is connected to another Transmission station or substation. For the purpose of this criterion, the collector bus for a generation plant is not considered a Transmission Facility, but is part of the generation interconnection Facility.

Voltage Value of a Line	Weight Value per Line
less than 200 kV (not applicable)	(not applicable)
200 kV to 299 kV	700
300 kV to 499 kV	1,300
500 kV and above	N/A

3. Transmission Facilities at a single station or substation location that are identified by their Reliability Coordinator, Planning Coordinator, or Transmission Planner as critical to the derivation of Interconnection Reliability Operating Limits (IROLs) and their associated contingencies.

4. Transmission Facilities identified as essential to meeting Nuclear Plant Interface Requirements (NPIRs).

Standard Development Timeline

This section is maintained by the drafting team during the development of the standard and will be removed when the standard is adopted by the NERC Board of Trustees (Board).

Description of Current Draft

CIP-014-4 is posted for a 45-day formal comment period with additional ballot.

Completed Actions	Date
Standards Committee approved Standard Authorization Request for posting	June 21, 2023
Standard Authorization Request posted for comment	July 26 – August 24, 2023
Accepted Revised Standard Authorization Request	January 17, 2024
45-day formal or informal comment period with ballot	May 20 – July 3, 2024
45-day formal or informal comment period with additional ballot	September 23 – November 6, 2024

10-day final ballot	May 28 – June 8, 2026
Board adoption	June 17, 2026

New or Modified Term(s) Used in NERC Reliability Standards

This section includes all new or modified terms used in the proposed standard that will be included in the *Glossary of Terms Used in NERC Reliability Standards* upon applicable regulatory approval. Terms used in the proposed standard that are already defined and are not being modified can be found in the *Glossary of Terms Used in NERC Reliability Standards*. The new or revised terms listed below will be presented for approval along with the proposed standard. Upon Board adoption, this section will be removed.

Term(s):

None.

A. Introduction

1. **Title:** Physical Security

2. **Number:** CIP-~~014-3~~014-4

3. **Purpose:** To identify and protect Transmission stations and Transmission substations, and their associated primary control centers, that if rendered inoperable or damaged ~~as a result of~~due to a physical attack, could result in instability, uncontrolled separation, or Cascading within an Interconnection.

4. **Applicability:**

   4.1. Functional Entities:

   4.1.1. ~~**4.1.1**~~ Transmission Owner that owns ~~**a**~~or jointly owns one or more Transmission ~~**station**~~stations or Transmission ~~**substation that meets any of the following**~~substations that meet the applicability criteria~~:~~ of Attachment 1.

   ~~**4.1.1.1** Transmission Facilities operated at 500 kV or higher. For the purpose of this criterion, the collector bus for a generation plant is not considered a Transmission Facility, but is part of the generation interconnection Facility.~~

   ~~**4.1.1.2** Transmission Facilities that are operating between 200 kV and 499 kV at a single station or substation, where the station or substation is connected at 200 kV or higher voltages to three or more other Transmission stations or substations and has an "aggregate weighted value" exceeding 3000 according to the table below. The "aggregate weighted value" for a single station or substation is determined by summing the "weight value per line" shown in the table below for each incoming and each outgoing BES Transmission Line that is connected to another Transmission station or substation. For the purpose of this criterion, the collector bus for a generation plant is not considered a Transmission Facility, but is part of the generation interconnection Facility.~~

~~**Voltage Value of a Line**~~	~~**Weight Value per Line**~~
~~less than 200 kV (not applicable)~~	~~(not applicable)~~
~~200 kV to 299 kV~~	~~700~~
~~300 kV to 499 kV~~	~~1300~~
~~500 kV and above~~	~~0~~

   ~~**4.1.1.3** Transmission Facilities at a single station or substation location that are identified by its Reliability Coordinator, Planning Coordinator, or Transmission Planner as critical to the derivation of Interconnection~~

~~Reliability Operating Limits (IROLs) and their associated contingencies.~~

~~**4.1.1.4** Transmission Facilities identified as essential to meeting Nuclear Plant Interface Requirements.~~

4.1.2. ~~**4.1.2**~~ Transmission Operator~~.~~

Exemption: Facilities in a "protected area," as defined in 10 C.F.R. § 73.2, within the scope of a security plan approved or accepted by the Nuclear Regulatory Commission are not subject to this Standard; or~~,~~ Facilities within the scope of a security plan approved or accepted by the Canadian Nuclear Safety Commission are not subject to this Reliability Standard.

5. ~~5.~~ Effective ~~Dates~~Date:

See Implementation Plan for CIP-~~014-2~~014-4.

~~6. Background:~~

~~This Reliability Standard addresses the directives from the FERC order issued March 7, 2014, *Reliability Standards for Physical Security Measures*, 146 FERC ¶ 61,166 (2014), which required NERC to develop a physical security reliability standard(s) to identify and protect facilities that if rendered inoperable or damaged could result in instability, uncontrolled separation, or Cascading within an Interconnection~~

B. Requirements and Measures

R1. Each Transmission Owner shall, ~~perform an initial risk assessment and subsequent risk assessments of its Transmission stations and Transmission substations (existing and planned to be in service within 24 months) that meet the criteria specified in Applicability Section 4.1.1. The initial and subsequent risk assessments shall consist of a transmission analysis or transmission analyses designed to~~ at least once every 36 calendar months, identify each applicable ~~the~~ Transmission station~~(s)~~ and Transmission substation~~(s) that if rendered inoperable or damaged could result in instability, uncontrolled separation, or Cascading within an Interconnection,~~ meeting any of the criteria in Attachment 1 that is either existing or planned to be in service within 36 calendar months. *[Violation Risk Factor: High; Time-Horizon: Long-term Planning]*

~~**1.1.** Subsequent risk assessments shall be performed:~~

~~At least once every 30 calendar months for a Transmission Owner that has identified in its previous risk assessment (as verified according to Requirement R2) one or more Transmission stations or Transmission substations that if rendered inoperable or damaged could result in instability, uncontrolled separation, or Cascading within an Interconnection; or~~

M1. Examples of evidence may include, but are not limited to, dated written or electronic documentation of the ~~risk assessment of its~~ Transmission station(s) and Transmission substation(s) (existing and those planned to be in service within ~~24~~ 36 calendar months) that meet any of the criteria in Attachment 1 ~~Applicability Section 4.1.1 as specified in Requirement R1. Additionally, examples of acceptable evidence may include, but are not limited to, dated written or electronic documentation of the identification of the primary control center that operationally controls each Transmission station or Transmission substation identified in the Requirement R1 risk assessment as specified in Requirement R1, Part 1.2~~.

R2. Each Transmission Owner with applicable Transmission station(s) or Transmission substation(s) identified in Requirement R1 shall identify proximate existing Bulk Electric System (BES) Transmission station(s) and BES Transmission substation(s), irrespective of ownership, within 1500 feet or 457 meters (the shortest distance, measured substation fence line to substation fence line) of an applicable Transmission station or Transmission substation identified in Requirement R1. *[Violation Risk Factor: Medium; Time-Horizon: Long-term Planning]*

M2. Examples of evidence may include, but are not limited to, dated written or electronic documentation of the BES Transmission stations or BES Transmission substations identified in Requirement R2.

R3. Each Transmission Owner shall have a documented risk assessment methodology for evaluating the loss of each applicable Transmission station or Transmission substation identified in Requirement R1. The methodology shall include, at a minimum, the following: *[Violation Risk Factor: High; Time-Horizon: Long-term Planning]*

3.1. Documented criteria for assessing instability, uncontrolled separation, or Cascading within an Interconnection. The criteria shall include, at a minimum, technically justified thresholds identifying unacceptable generation and load loss within an Interconnection.

3.2. A provision that steady-state and dynamic simulations shall each be performed using at a minimum one System peak Load case and one System Off-Peak Load case.

3.3. Specifications for simulations at each applicable Transmission station or Transmission substation identified in accordance with Requirement R1 and, if applicable, at each associated proximate existing BES Transmission station(s) and BES Transmission substation(s) identified in accordance with Requirement R2, that include:

3.3.1. At the applicable Transmission station or Transmission substation:

3.3.1.1. Prior loss of communication and Protection Systems;

3.3.1.2. Application of a Fault or Faults; and

3.3.1.3. Delayed (remote) clearing times shall be used unless otherwise technically substantiated.

3.3.2. At each proximate existing BES Transmission station(s) and BES Transmission substation(s), as applicable:

3.3.2.1. Application of a Fault or Faults, either simultaneous with or following the Fault or Faults applied under Part 3.3.1.2; and

3.3.2.2. Normal clearing times shall be used unless otherwise technically substantiated.

3.3.3. A documented justification for the Fault(s) associated with physical attack to be simulated. A single justification may be used for multiple locations. The justification shall include at a minimum:

3.3.3.1. The type of credible high-severity physical attack considered; and

3.3.3.2. The type of Fault(s) selected based upon the attack considered.

3.3.4. Removal of all Elements that Protection Systems and other controls are expected to automatically disconnect.

3.3.5. Actual or more conservative clearing times shall be used.

M3. Each Transmission Owner shall provide dated evidence, such as electronic or hard copies, of a risk assessment methodology satisfying Requirement R3.

R4. Each Transmission Owner with applicable Transmission station(s) and Transmission substation(s) identified in Requirement R1 jointly owned by multiple Transmission Owners shall coordinate with each appropriate Transmission Owner(s) to determine and document their individual and joint responsibilities under Requirement R3 and Requirement R5. *[Violation Risk Factor: Medium; Time-Horizon: Operations Planning, Long-term Planning]*

M4. Examples of acceptable evidence may include, but are not limited to, dated documentation, such as meeting minutes, agreements, and email correspondence, that identifies that agreement has been reached on individual and joint responsibilities for performing the required risk assessments.

R5. At least once every 36 calendar months, each Transmission Owner shall perform a risk assessment to identify applicable Transmission station(s) and Transmission substation(s) identified in Requirement R1, that if rendered inoperable or damaged could result in instability, uncontrolled separation, or Cascading within an Interconnection, using the methodology established in Requirement R3. Jointly owned Transmission station(s) and Transmission substation(s) shall be assessed according to the responsibilities documented under Requirement R4. If proximate BES Transmission station(s) and BES Transmission substation(s) were identified in Requirement R2, they shall be included in the risk assessment according to Requirement R3, Part 3.3. *[Violation Risk Factor: High; Time-Horizon: Operations Planning, Long-term Planning]*

5.1. If during a risk assessment, a Transmission station or Transmission substation is identified in either the dynamic or steady-state simulation as resulting in instability, uncontrolled separation, or Cascading within an Interconnection when rendered inoperable or damaged, then no further simulation is required.

5.2. If ~~At least once every 60 calendar months for a Transmission Owner that has not identified in its~~ a previous risk assessment ~~(as verified according to Requirement R2) any Transmission stations or Transmission substations that if rendered inoperable or damaged could result in~~ has identified a Transmission station or Transmission substation as causing instability, uncontrolled separation, or Cascading within an Interconnection when rendered inoperable or damaged, then the Transmission Owner may forgo additional assessments on that Transmission station or Transmission substation. Requirement R5, Part 5.3 and Requirement R7 through Requirement R10 still apply to that Transmission station or Transmission substation until a new risk assessment demonstrates otherwise.

5.3. ~~**1.2.**~~ The Transmission Owner shall identify the primary control center that operationally controls each Transmission station or Transmission substation

identified ~~in the Requirement R1 risk assessment~~ as resulting in instability, uncontrolled separation, or Cascading within an Interconnection when rendered inoperable or damaged in the Requirement R5 risk assessment.

M5. Examples of acceptable evidence may include, but are not limited to, dated written or electronic documentation of the risk assessment satisfying Requirement R5 including the identified Transmission station(s) or Transmission substation(s). For Requirement R5, Part 5.3, examples of acceptable evidence may include, but are not limited to, dated written or electronic documentation of the identification of the primary control center that operationally controls each identified Transmission station or Transmission substation.

R6. ~~**R2.**~~ Each Transmission Owner shall have an unaffiliated third party verify the risk assessment performed under Requirement ~~R1~~R5. The verification may occur ~~concurrent~~concurrently with or after the risk assessment performed under Requirement ~~R1. *[VRF*~~R5. *[Violation Risk Factor: Medium; Time-Horizon: Long-term Planning]*

6.1. ~~**2.1.**~~ Each Transmission Owner shall select an unaffiliated verifying entity that is either:

- A registered Planning Coordinator, Transmission Planner, or Reliability Coordinator; or
- An entity that has transmission planning or analysis experience.

6.2. ~~**2.2.**~~ The unaffiliated ~~third party~~third-party verification shall verify the Transmission Owner's risk assessment performed under Requirement ~~R1~~R5, which may include recommendations for the addition or deletion of a Transmission station(s) or Transmission substation(s). The Transmission Owner shall ensure the verification is completed within 90 calendar days following the completion of the Requirement ~~R1~~R5 risk assessment.

6.3. ~~**2.3.**~~ If the unaffiliated verifying entity recommends that the Transmission Owner add a Transmission station(s) or Transmission substation(s) to, or remove a Transmission station~~(s)~~ or Transmission substation~~(s)~~ from, its identification under Requirement ~~R1~~R5, the Transmission Owner shall either, within 60 calendar days of completion of the verification, for each recommended addition or removal of a Transmission station or Transmission substation:

- Modify its identification under Requirement ~~R1~~R5 consistent with the recommendation; or
- Document the technical basis for not modifying the identification in accordance with the recommendation.

6.4. ~~**2.4.**~~ Each Transmission Owner shall implement procedures, such as the use of non-disclosure agreements, for protecting sensitive or confidential information made available to the unaffiliated ~~third party~~third-party verifier and to protect or

exempt sensitive or confidential information developed pursuant to this Reliability Standard from public disclosure.

M6. ~~**M2.**~~ Examples of acceptable evidence may include, but are not limited to, dated written or electronic documentation that the Transmission Owner completed an unaffiliated third party verification of the Requirement ~~R1~~R5 risk assessment and satisfied all of the applicable provisions of Requirement ~~R2~~R6, including, if applicable, documenting the technical basis for not modifying the ~~Requirement R1~~ identification in Requirements R1, R2, R3, R4, and R5 as specified under Part ~~2.3~~6.3. Additionally, examples of evidence may include, but are not limited to, written or electronic documentation of procedures to protect information under Part ~~2.4~~6.4.

R7. ~~**R3.**~~ For a primary control center(s) identified by the Transmission Owner according to Requirement ~~R1~~R5, Part ~~1.2~~5.3 that a) operationally controls an identified Transmission station or Transmission substation verified according to Requirement ~~R2~~R6, and b) is not under the operational control of the Transmission Owner: the Transmission Owner shall, within seven calendar days following completion of Requirement ~~R2~~R6, notify the Transmission Operator that has operational control of the primary control center of such identification and the date of completion of Requirement ~~R2. *[VRF*~~R6. *[Violation Risk Factor: Lower; Time-Horizon: Long-term Planning]*

7.1. ~~**3.1.**~~ If a Transmission station or Transmission substation previously identified under ~~Requirement~~Requirements R1 and R5 and verified according to Requirement ~~R2~~R6 is removed from the identification during a subsequent risk assessment performed according to Requirement ~~R1~~R5 or a verification according to Requirement ~~R2~~R6, then the Transmission Owner shall, within seven calendar days following the verification or the subsequent risk assessment, notify the Transmission Operator that has operational control of the primary control center of the removal.

M7. ~~**M3.**~~ Examples of acceptable evidence may include, but are not limited to, ~~dated~~ written or electronic notifications or communications that the Transmission Owner notified each Transmission Operator, as applicable, according to Requirement ~~R3~~R7.

R8. ~~**R4.**~~ Each Transmission Owner that identified a Transmission station, Transmission substation, or a primary control center in Requirement ~~R1~~R5 and verified according to Requirement ~~R2~~R6, and each Transmission Operator notified by a Transmission Owner according to Requirement ~~R3~~R7, shall conduct an evaluation of the potential threats and vulnerabilities of a physical attack to each of their respective Transmission station(s), Transmission substation(s), and primary control center(s) identified in Requirement ~~R1~~R5 and verified according to Requirement ~~R2~~R6. The evaluation shall consider the following: *[~~VRF~~Violation Risk Factor: Medium; Time-Horizon: Operations Planning, Long-term Planning]*

8.1. ~~**4.1.**~~ Unique characteristics of the identified and verified Transmission station(s), Transmission substation(s), and primary control center(s);

8.2. ~~**4.2.**~~ Prior history of attack(s) on similar facilities taking into account the frequency, geographic proximity, and severity of past physical security related events; and

8.3. ~~**4.3.**~~ Intelligence or threat warnings received from sources such as law enforcement, the Electric Reliability Organization (ERO), the Electricity Sector Information Sharing and Analysis Center (~~ES-ISAC~~E-ISAC), U.S. federal and/or Canadian governmental agencies, or their successors.

~~M4~~M8. Examples of evidence may include, but are not limited to, dated written or electronic documentation that the Transmission Owner or Transmission Operator conducted an evaluation of the potential threats and vulnerabilities of a physical attack to their respective Transmission station(s), Transmission substation(s), and primary control center(s) as specified in Requirement ~~R4~~R8.

R9. ~~**R5.**~~ Each Transmission Owner that identified a Transmission station, Transmission substation, or primary control center in Requirement ~~R1~~R5 and verified according to Requirement ~~R2~~R6, and each Transmission Operator notified by a Transmission Owner according to Requirement ~~R3~~R7, shall develop and implement a documented physical security plan(s) that covers their respective Transmission station(s), Transmission substation(s), and primary control center(s). The physical security plan(s) shall be developed within 120 calendar days following the completion of Requirement ~~R2~~R6 and executed according to the timeline specified in the physical security plan(s). The physical security plan(s) shall include the following attributes: [~~*VRF*~~*Violation Risk Factor*: *High; Time-Horizon: Long-term Planning*]

9.1. ~~**5.1.**~~ Resiliency or security measures designed collectively to deter, detect, delay, assess, communicate, and respond to potential physical threats and vulnerabilities identified during the evaluation conducted in Requirement ~~R4~~R8.

9.2. ~~**5.2.**~~ Law enforcement contact and coordination information.

9.3. ~~**5.3.**~~ A timeline for executing the physical security enhancements and modifications specified in the physical security plan.

9.4. ~~**5.4.**~~ Provisions to evaluate evolving physical threats, and their corresponding security measures, to the Transmission station(s), Transmission substation(s), or primary control center(s).

~~M5~~M9. Examples of evidence may include, but are not limited to, dated written or electronic documentation of its physical security plan(s) that covers their respective identified and verified Transmission station(s), Transmission substation(s), and primary control center(s) as specified in Requirement ~~R5~~R6, and additional evidence demonstrating execution of the physical security plan according to the timeline specified in the physical security plan.

R10. ~~**R6.**~~ Each Transmission Owner that identified a Transmission station, Transmission substation, or primary control center in Requirement ~~R1~~R5 and verified according to Requirement ~~R2~~R6, and each Transmission Operator notified by a Transmission Owner according to Requirement ~~R3~~R7, shall have an unaffiliated third party review the evaluation performed under Requirement ~~R4~~R8 and the security plan(s) developed under Requirement ~~R5~~R9. The review may occur concurrently with or after completion of the evaluation performed under Requirement ~~R4~~R8 and the security plan development under Requirement ~~R5. *[VRF*~~R9. *[Violation Risk Factor: Medium; Time-Horizon: Long-term Planning]*

10.1. ~~**6.1.**~~ Each Transmission Owner and Transmission Operator shall select an unaffiliated ~~third party~~third-party reviewer from the following:

- An entity or organization with electric industry physical security experience and whose review staff has at least one member who holds either a Certified Protection Professional (CPP) or Physical Security Professional (PSP) certification~~.~~;
- An entity or organization approved by the ERO~~.~~;
- A governmental agency with physical security expertise~~.~~; or
- An entity or organization with demonstrated law enforcement, government, or military physical security expertise.

10.2. ~~**6.2.**~~ The Transmission Owner or Transmission Operator, respectively, shall ensure that the unaffiliated ~~third party~~third-party review is completed within 90 calendar days of completing the security plan(s) developed in Requirement ~~R5~~R9. The unaffiliated ~~third party~~third-party review may, but is not required to, include recommended changes to the evaluation performed under Requirement ~~R4~~R8 or the security plan(s) developed under Requirement ~~R5~~R9.

10.3. ~~**6.3.**~~ If the unaffiliated ~~third party~~third-party reviewer recommends changes to the evaluation performed under Requirement ~~R4~~R8 or security plan(s) developed under Requirement ~~R5~~R9, the Transmission Owner or Transmission Operator shall, within 60 calendar days of the completion of the unaffiliated third party review, for each recommendation:

- Modify its evaluation or security plan(s) consistent with the recommendation; or
- Document the reason(s) for not modifying the evaluation or security plan(s) consistent with the recommendation.

10.4. ~~**6.4.**~~ Each Transmission Owner and Transmission Operator shall implement procedures, such as the use of non-disclosure agreements, for protecting sensitive or confidential information made available to the unaffiliated ~~third party~~third-party reviewer and to protect or exempt sensitive or confidential

information developed pursuant to this Reliability Standard from public disclosure.

~~M6~~M10. Examples of evidence may include, but are not limited to, written or electronic documentation that the Transmission Owner or Transmission Operator had an unaffiliated third party review the evaluation performed under Requirement ~~R4~~R8 and the security plan(s) developed under Requirement ~~R5~~R9 as specified in Requirement ~~R6~~R10 including, if applicable, documenting the reasons for not modifying the evaluation or security plan(s) in accordance with a recommendation under Part ~~6.3~~10.3. Additionally, examples of evidence may include, but are not limited to, written or electronic documentation of procedures to protect information under Part ~~6.4~~10.4.

C. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority

~~: As defined in the NERC Rules of Procedure,~~ "Compliance Enforcement Authority" means NERC or the Regional Entity in their respective roles of monitoring and enforcing compliance with the NERC Reliability Standards.

~~**1.2. Evidence Retention**~~

1.2. Evidence Retention: The following evidence retention ~~periods~~period(s) identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the Compliance Enforcement Authority may ask an entity to provide other evidence ~~during an on-site visit~~ to show that it was compliant for the ~~full-time~~full-time period since the last audit.

The Transmission Owner and Transmission Operator shall keep data or evidence to show compliance, as identified below, unless directed by its Compliance Enforcement Authority ~~()~~ to retain specific evidence for a longer period of time as part of an investigation~~.~~:

The responsible entities shall retain ~~documentation as~~ evidence, as per Requirements R1 through R10, for three years.

If a Responsible Entity is found non-compliant, it shall keep information related to the non-compliance until mitigation is complete and approved, or for the time specified above, whichever is longer.

The CEA shall keep the last audit records and all requested and submitted subsequent audit records~~, subject to the confidentiality provisions of Section 1500 of the Rules of Procedure and the provisions of Section 1.4 below~~.

~~**1.3. Compliance Monitoring and Assessment Processes:**~~

~~Compliance Audits~~

~~Self-Certifications~~
~~Spot Checking~~

1.3. Compliance Monitoring and Enforcement Program: "Compliance Monitoring Enforcement Program" or "CMEP" means, depending on the context (1) the NERC Compliance Monitoring and Enforcement Program (Appendix 4C to the NERC Rules of Procedure) or the Commission-approved program of a Regional Entity, as applicable, or (2) the program, department or organization within

NERC or a Regional Entity that is responsible for performing compliance monitoring and enforcement activities with respect to Registered Entities' compliance with Reliability Standards.

Guidelines and Technical Basis

Section 4Attachment 1 — Applicability Criteria

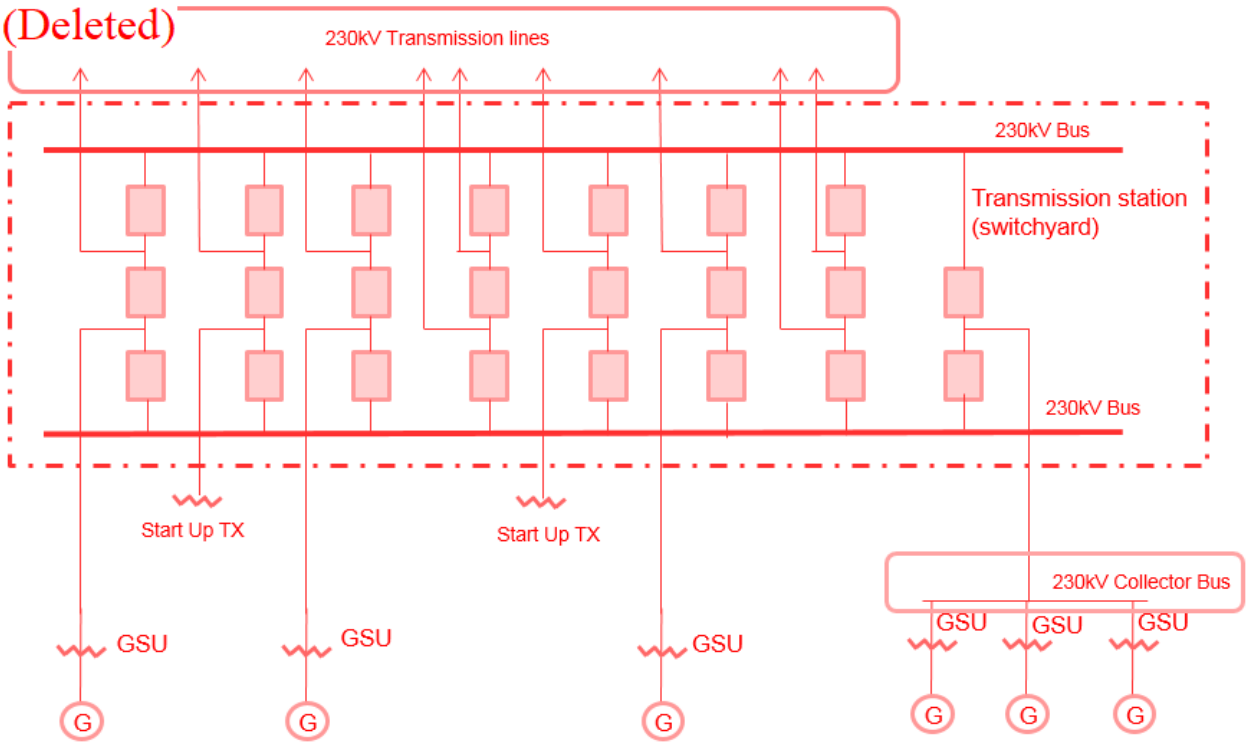
The purpose of Reliability Standard CIP-014 is to protect Transmission stations and Transmission substations, and their associated primary control centers that if rendered inoperable or damaged as a result of a physical attack could result in instability, uncontrolled separation, or Cascading within an Interconnection. To properly include those entities that own or operate such Facilities, the Reliability Standard CIP-014 first applies to Transmission Owners that own Transmission Facilities that meet the specific criteria in Applicability Section 4.1.1.1 through 4.1.1.4. The Facilities described in Applicability Section 4.1.1.1 through 4.1.1.4 mirror those Transmission Facilities that meet the bright line criteria for "Medium Impact" Transmission Facilities under Attachment 1 of Reliability Standard CIP-002-5.1. Each Transmission Owner that owns Transmission Facilities that meet the criteria in Section 4.1.1.1 through 4.1.1.4 is required to perform a risk assessment as specified in Requirement R1 to identify its Transmission stations and Transmission substations, and their associated primary control centers, that if rendered inoperable or damaged as a result of a physical attack could result in instability, uncontrolled separation, or Cascading within an Interconnection. The Standard Drafting Team (SDT) expects this population will be small and that many Transmission Owners that meet the applicability of this standard will not actually identify any such Facilities. Only those Transmission Owners with Transmission stations or Transmission substations identified in the risk assessment (and verified under Requirement R2) have performance obligations under Requirements R3 through R6.

This standard also applies to Transmission Operators. A Transmission Operator's obligations under the standard, however, are only triggered if the Transmission Operator is notified by an applicable Transmission Owner under Requirement R3 that the Transmission Operator operates a primary control center that operationally controls a Transmission station(s) or Transmission substation(s) identified in the Requirement R1 risk assessment. A primary control center operationally controls a Transmission station or Transmission substation when the control center's electronic actions can cause direct physical action at the identified Transmission station or Transmission substation, such as opening a breaker, as opposed to a control center that only has information from the Transmission station or Transmission substation and must coordinate direct action through another entity. Only Transmission Operators who are notified that they have primary control centers under this standard have performance obligations under Requirements R4 through R6. In other words, primary control center for purposes of this Standard is the control center that the Transmission Owner or Transmission Operator, respectively, uses as its primary, permanently manned site to physically operate a Transmission station or Transmission substation that is identified in Requirement R1 and verified in Requirement R2. Control centers that provide back-up capability are not applicable, as they are a form of resiliency and intentionally redundant.

The SDT considered several options for bright line criteria that could be used to determine applicability and provide an initial threshold that defines the set of Transmission stations and Transmission substations that would meet the directives of the FERC order on physical security (*i.e.*, those that could cause instability, uncontrolled separation, or Cascading within an

~~Interconnection). The SDT determined that using the criteria for Medium Impact Transmission Facilities in Attachment 1 of CIP-002-5.1 would provide a conservative threshold for defining which Transmission stations and Transmission substations must be included in the risk assessment in Requirement R1 of CIP-014. Additionally, the SDT concluded that using the CIP-002-5.1 Medium Impact criteria was appropriate because it has been approved by stakeholders, NERC, and FERC, and its use provides a technically sound basis to determine which Transmission Owners should conduct the risk assessment. As described in CIP-002-5.1, the failure of a Transmission station or Transmission substation that meets the Medium Impact criteria could have the capability to result in exceeding one or more Interconnection Reliability Operating Limits (IROLs). The SDT understands that using this bright line criteria to determine applicability may require some Transmission Owners to perform risk assessments under Requirement R1 that will result in a finding that none of their Transmission stations or Transmission substations would pose a risk of instability, uncontrolled separation, or Cascading within an Interconnection. However, the SDT determined that higher bright lines could not be technically justified to ensure inclusion of all Transmission stations and Transmission substations, and their associated primary control centers that, if rendered inoperable or damaged as a result of a physical attack could result in instability, uncontrolled separation, or Cascading within an Interconnection. Further guidance and technical basis for the bright line criteria for Medium Impact Facilities can be found in the Guidelines and Technical Basis section of CIP-002-5.1.~~

~~Additionally, the SDT determined that it was not necessary to include Generator Operators and Generator Owners in the Reliability Standard. First, Transmission stations or Transmission substations interconnecting generation facilities are considered when determining applicability. Transmission Owners will consider those Transmission stations and Transmission substations that include a Transmission station on the high side of the Generator Step-up transformer (GSU) using Applicability Section 4.1.1.1 and 4.1.1.2. As an example, a Transmission station or Transmission substation identified as a Transmission Owner facility that interconnects generation will be subject to the Requirement R1 risk assessment if it operates at 500kV or greater or if it is connected at 200 kV – 499kV to three or more other Transmission stations or Transmission substations and has an "aggregate weighted value" exceeding 3000 according to the table in Applicability Section 4.1.1.2. Second, the Transmission analysis or analyses conducted under Requirement R1 should take into account the impact of the loss of generation connected to applicable Transmission stations or Transmission substations. Additionally, the FERC order does not explicitly mention generation assets and is reasonably understood to focus on the most critical Transmission Facilities. The diagram below shows an example of a station.~~



~~Also, the SDT uses the phrase "Transmission stations or Transmission substations" to recognize the existence of both stations and substations. Many entities in industry consider a substation to be a location with physical borders (i.e. fence, wall, etc.) that contains at least an autotransformer. Locations also exist that do not contain autotransformers, and many entities in industry refer to those locations as stations (switching stations or switchyards). Therefore, the SDT chose to use both "station" and "substation" to refer to the locations where groups of Transmission Facilities exist.~~

~~On the issue of joint ownership, the SDT recognizes that this issue is not unique to CIP-014, and expects that the applicable Transmission Owners and Transmission Operators will develop memorandums of understanding, agreements, Coordinated Functional Registrations, or procedures, etc., to designate responsibilities under CIP-014 when joint ownership is at issue, which is similar to what many entities have completed for other Reliability Standards.~~

~~The language contained in the applicability section regarding the collector bus is directly copied from CIP-002-5.1, Attachment 1, and has no additional meaning within the CIP-014 standard.~~

~~Requirement R1~~

~~The initial risk assessment required under Requirement R1 must be completed on or before the effective date of the standard. Subsequent risk assessments are to be performed at least once every 30 or 60 months depending on the results of the previous risk assessment per Requirement R1, Part 1.1. In performing the risk assessment under Requirement R1, the Transmission Owner should first identify their population of Transmission stations and Transmission substations that meet the criteria contained in Applicability Section 4.1.1.~~

~~Requirement R1 then requires the Transmission Owner to perform a risk assessment, consisting of a transmission analysis, to determine which of those Transmission stations and Transmission Substations if rendered inoperable or damaged could result in instability, uncontrolled separation, or Cascading within an Interconnection. The requirement is not to require identification of, and thus, not intended to bring within the scope of the standard a Transmission station or Transmission substation unless the applicable Transmission Owner determines through technical studies and analyses based on objective analysis, technical expertise, operating experience and experienced judgment that the loss of such facility would have a critical impact on the operation of the Interconnection in the event the asset is rendered inoperable or damaged. In the November 20, 2014 Order, FERC reiterated that "only an instability that has a "critical impact on the operation of the interconnection" warrants finding that the facility causing the instability is critical under Requirement R1." The Transmission Owner may determine the criteria for critical impact by considering, among other criteria, any of the following:~~

- ~~Criteria or methodology used by Transmission Planners or Planning Coordinators in TPL-001-4, Requirement R6~~
- ~~NERC EOP-004-2 reporting criteria~~
- ~~Area or magnitude of potential impact~~

~~The standard does not mandate the specific analytical method for performing the risk assessment. The Transmission Owner has the discretion to choose the specific method that best suites its needs. As an example, an entity may perform a Power Flow analysis and stability analysis at a variety of load levels.~~

~~Performing Risk Assessments~~

~~The Transmission Owner has the discretion to select a transmission analysis method that fits its facts and system circumstances. To mandate a specific approach is not technically desirable and may lead to results that fail to adequately consider regional, topological, and system circumstances. The following guidance is only an example on how a Transmission Owner may perform a power flow and/or stability analysis to identify those Transmission stations and Transmission substations that if rendered inoperable or damaged as a result of a physical attack could result in instability, uncontrolled separation, or Cascading within an Interconnection. An entity could remove all lines, without regard to the voltage level, to a single Transmission station or Transmission substation and review the simulation results to assess system behavior to determine if Cascading of Transmission Facilities, uncontrolled separation, or voltage or frequency instability is likely to occur over a significant area of the Interconnection. Using engineering judgment, the Transmission Owner (possibly in consultation with regional planning or operation committees and/or ISO/RTO committee input) should develop criteria (e.g. imposing a fault near the removed Transmission station or Transmission substation) to identify a contingency or parameters that result in potential instability, uncontrolled separation, or Cascading within an Interconnection. Regional consultation on these matters is likely to be helpful and informative, given that the inputs for the risk assessment and the attributes of what constitutes instability, uncontrolled separation, or Cascading within an Interconnection will~~

likely vary from region-to-region or from ISO-to-ISO based on topology, system characteristics, and system configurations. Criteria could also include post-contingency facilities loadings above a certain emergency rating or failure of a power flow case to converge. Available special protection systems (SPS), if any, could be applied to determine if the system experiences any additional instability which may result in uncontrolled separation. Example criteria may include:

(a) Thermal overloads beyond facility emergency ratings;

(b) Voltage deviation exceeding ± 10%; or

(c) Cascading outage/voltage collapse; or

(d) Frequency below under-frequency load-shed points

Periodicity

A Transmission Owner who identifies one or more Transmission stations or Transmission substations (as verified under Requirement R2) that if rendered inoperable or damaged could result in instability, uncontrolled separation, or Cascading within an Interconnection is required to conduct a risk assessment at least once every 30 months. This period ensures that the risk assessment remains current with projected conditions and configurations in the planned system. This risk assessment, as the initial assessment, must consider applicable planned Transmission stations and Transmission substations to be in service within 24 months. The 30 month timeframe aligns with the 24 month planned to be in service date because the Transmission Owner is provided the flexibility, depending on its planning cycle and the frequency in which it may plan to construct a new Transmission station or Transmission substation to more closely align these dates. The requirement is to conduct the risk assessment at least once every 30 months, so for a Transmission Owner that believes it is better to conduct a risk assessment once every 24 months, because of its planning cycle, it has the flexibility to do so.

Transmission Owners that have not identified any Transmission stations or Transmission substations (as verified under Requirement R2) that if rendered inoperable or damaged could result in instability, uncontrolled separation, or Cascading within an Interconnection are unlikely to see changes to their risk assessment in the Near-Term Planning Horizon. Consequently, a 60 month periodicity for completing a subsequent risk assessment is specified.

Identification of Primary Control Centers

After completing the risk assessment specified in Requirement R1, it is important to additionally identify the primary control center that operationally controls each Transmission station or Transmission substation that if rendered inoperable or damaged could result in instability, uncontrolled separation, or Cascading within an Interconnection. A primary control center "operationally controls" a Transmission station or Transmission substation when the control center's electronic actions can cause direct physical actions at the identified Transmission station and Transmission substation, such as opening a breaker.

Requirement R2

This requirement specifies verification of the risk assessment performed under Requirement R1 by an entity other than the owner or operator of the Requirement R1 risk assessment.

A verification of the risk assessment by an unaffiliated third party, as specified in Requirement R2, could consist of:

1. Certifying that the Requirement R1 risk assessment considers the Transmission stations and Transmission substations identified in Applicability Section 4.1.1.
2. Review of the model used to conduct the risk assessment to ensure it contains sufficient system topology to identify Transmission stations and Transmission substations that if rendered inoperable or damaged could cause instability, uncontrolled separation, or Cascading within an Interconnection.
3. Review of the Requirement R1 risk assessment methodology.

This requirement provides the flexibility for a Transmission Owner to select from unaffiliated registered and non-registered entities with transmission planning or analysis experience to perform the verification of the Requirement R1 risk assessment. The term unaffiliated means that the selected verifying entity cannot be a corporate affiliate (*i.e.*, the verifying or third party reviewer cannot be an entity that corporately controls, is controlled by or is under common control with, the Transmission Owner). The verifying entity also cannot be a division of the Transmission Owner that operates as a functional unit.

The prohibition on registered entities using a corporate affiliate to conduct the verification, however, does not prohibit a governmental entity (e.g., a city, a municipality, a U.S. federal power marketing agency, or any other political subdivision of U.S. or Canadian federal, state, or provincial governments) from selecting as the verifying entity another governmental entity within the same political subdivision. For instance, a U.S. federal power marketing agency may select as its verifier another U.S. federal agency to conduct its verification so long as the selected entity has transmission planning or analysis experience. Similarly, a Transmission Owner owned by a Canadian province can use a separate agency of that province to perform the verification. The verifying entity, however, must still be a third party and cannot be a division of the registered entity that operates as a functional unit.

Requirement R2 also provides that the "verification may occur concurrent with or after the risk assessment performed under Requirement R1." This provision is designed to provide the Transmission Owner the flexibility to work with the verifying entity throughout (*i.e.*, concurrent with) the risk assessment, which for some Transmission Owners may be more efficient and effective. In other words, a Transmission Owner could collaborate with their unaffiliated verifying entity to perform the risk assessment under Requirement R1 such that both Requirement R1 and Requirement R2 are satisfied concurrently. The intent of Requirement R2 is to have an entity other than the owner or operator of the facility to be involved in the risk assessment process and have an opportunity to provide input. Accordingly, Requirement R2 is designed to allow entities the discretion to have a two-step process, where the Transmission Owner performs the risk assessment and subsequently has a third party review that assessment, or a one-step process, where the entity collaborates with a third party to perform the risk assessment.

Characteristics to consider in selecting a third party reviewer could include:

- Registered Entity with applicable planning and reliability functions.
- Experience in power system studies and planning.
- The entity's understanding of the MOD standards, TPL standards, and facility ratings as they pertain to planning studies.
- The entity's familiarity with the Interconnection within which the Transmission Owner is located.

With respect to the requirement that Transmission owners develop and implement procedures for protecting confidential and sensitive information, the Transmission Owner could have a method for identifying documents that require confidential treatment. One mechanism for protecting confidential or sensitive information is to prohibit removal of sensitive or confidential information from the Transmission Owner's site. Transmission Owners could include such a prohibition in a non-disclosure agreement with the verifying entity.

A Technical feasibility study is not required in the Requirement R2 documentation of the technical basis for not modifying the identification in accordance with the recommendation.

On the issue of the difference between a verifier in Requirement R2 and a reviewer in Requirement R6, the SDT indicates that the verifier will confirm that the risk assessment was completed in accordance with Requirement R1, including the number of Transmission stations and substations identified, while the reviewer in Requirement R6 is providing expertise on the manner in which the evaluation of threats was conducted in accordance with Requirement R4, and the physical security plan in accordance with Requirement R5. In the latter situation there is no verification of a technical analysis, rather an application of experience and expertise to provide guidance or recommendations, if needed.

Parts 2.4 and 6.4 require the entities to have procedures to protect the confidentiality of sensitive or confidential information. Those procedures may include the following elements:

1. Control and retention of information on site for third-party verifiers/reviewers.
2. Only "need to know" employees, etc., get the information.
3. Marking documents as confidential
4. Securely storing and destroying information when no longer needed.
5. Not releasing information outside the entity without, for example, General Counsel sign-off.

Requirement R3

Some Transmission Operators will have obligations under this standard for certain primary control centers. Those obligations, however, are contingent upon a Transmission Owner first completing the risk assessment specified by Requirement R1 and the verification specified by Requirement R2. Requirement R3 is intended to ensure that a Transmission Operator that has operational control of a primary control center identified in Requirement R1 receive notice so

that the Transmission Operator may fulfill the rest of the obligations required in Requirements R4 through R6. Since the timing obligations in Requirements R4 through R6 are based upon completion of Requirement R2, the Transmission Owner must also include within the notice the date of completion of Requirement R2. Similarly, the Transmission Owner must notify the Transmission Operator of any removals from identification that result from a subsequent risk assessment under Requirement R1 or as a result of the verification process under Requirement R2.

Requirement R4

This requirement requires owners and operators of facilities identified by the Requirement R1 risk assessment and that are verified under Requirement R2 to conduct an assessment of potential threats and vulnerabilities to those Transmission stations, Transmission substations, and primary control centers using a tailored evaluation process. Threats and vulnerabilities may vary from facility to facility based on any number of factors that include, but are not limited to, location, size, function, existing physical security protections, and attractiveness as a target.

In order to effectively conduct a threat and vulnerability assessment, the asset owner may be the best source to determine specific site vulnerabilities, but current and evolving threats may best be determined by others in the intelligence or law enforcement communities. A number of resources have been identified in the standard, but many others exist and asset owners are not limited to where they may turn for assistance. Additional resources may include state or local fusion centers, U.S. Department of Homeland Security, Federal Bureau of Investigations (FBI), Public Safety Canada, Royal Canadian Mounted Police, and InfraGard chapters coordinated by the FBI.

The Responsible Entity is required to take a number of factors into account in Parts 4.1 to 4.3 in order to make a risk-based evaluation under Requirement R4.

To assist in determining the current threat for a facility, the prior history of attacks on similarly protected facilities should be considered when assessing probability and likelihood of occurrence at the facility in question.

Resources that may be useful in conducting threat and vulnerability assessments include:

- NERC Security Guideline for the Electricity Sector: Physical Security.
- NERC Security Guideline: Physical Security Response.
- ASIS International General Risk Assessment Guidelines.
- ASIS International Facilities Physical Security Measure Guideline.
- ASIS International Security Management Standard: Physical Asset Protection.
- Whole Building Design Guide – Threat/Vulnerability Assessments.

Requirement R5

This requirement specifies development and implementation of a security plan(s) designed to protect against attacks to the facilities identified in Requirement R1 based on the assessment performed under Requirement R4.

Requirement R5 specifies the following attributes for the physical security plan:

- *Resiliency or security measures designed collectively to deter, detect, delay, assess, communicate, and respond to potential physical threats and vulnerabilities identified during the evaluation conducted in Requirement R4.*

  Resiliency may include, among other things:

  a. System topology changes,

  b. Spare equipment,

  c. Construction of a new Transmission station or Transmission substation.

  While most security measures will work together to collectively harden the entire site, some may be allocated to protect specific critical components. For example, if protection from gunfire is considered necessary, the entity may only install ballistic protection for critical components, not the entire site.

- *Law enforcement contact and coordination information.*

  Examples of such information may be posting 9-1-1 for emergency calls and providing substation safety and familiarization training for local and federal law enforcement, fire department, and Emergency Medical Services.

- *A timeline for executing the physical security enhancements and modifications specified in the physical security plan.*

  Entities have the flexibility to prioritize the implementation of the various resiliency or security enhancements and modifications in their security plan according to risk, resources, or other factors. The requirement to include a timeline in the physical security plan for executing the actual physical security enhancements and modifications does not also require that the enhancements and modifications be completed within 120 days. The actual timeline may extend beyond the 120 days, depending on the amount of work to be completed.

- *Provisions to evaluate evolving physical threats, and their corresponding security measures, to the*Applicable Transmission station(s), or Transmission substation(s), *or primary control center(s).* are those that meet any of the following criteria:

1. Transmission Facilities operated at 500 kV or higher. For the purpose of this criterion, the collector bus for a generation plant is not considered a Transmission Facility, but is part of the generation interconnection Facility.

2. Transmission Facilities that are operating between 200 kV and 499 kV at a single station or substation, where the station or substation is connected at 200 kV or higher voltages to three or more other Transmission stations or substations and has an "aggregate weighted value" exceeding 3000 according to the table below. The "aggregate weighted value" for a

single station or substation is determined by summing the "weight value per line" shown in the table below for each incoming and each outgoing BES Transmission Line that is connected to another Transmission station or substation. For the purpose of this criterion, the collector bus for a generation plant is not considered a Transmission Facility, but is part of the generation interconnection Facility.

A registered entity's physical security plan should include processes and responsibilities for obtaining and handling alerts, intelligence, and threat warnings from various sources. Some of these sources could include the ERO, ES-ISAC, and US and/or Canadian federal agencies. This information should be used to reevaluate or consider changes in the security plan and corresponding security measures of the security plan found in R5.

Incremental changes made to the physical security plan prior to the next required third party review do not require additional third party reviews.

Voltage Value of a Line	Weight Value per Line
less than 200 kV (not applicable)	(not applicable)
200 kV to 299 kV	700
300 kV to 499 kV	1300
500 kV and above	N/A

Requirement R6

This requirement specifies review by an entity other than the Transmission Owner or Transmission Operator with appropriate expertise for the evaluation performed according to Requirement R4 and the security plan(s) developed according to Requirement R5. As with Requirement R2, the term unaffiliated means that the selected third party reviewer cannot be a corporate affiliate (*i.e.*, the third party reviewer cannot be an entity that corporately controls, is controlled by or is under common control with, the Transmission Operator). A third party reviewer also cannot be a division of the Transmission Operator that operates as a functional unit.

As noted in the guidance for Requirement R2, the prohibition on registered entities using a corporate affiliate to conduct the review, however, does not prohibit a governmental entity from selecting as the third party reviewer another governmental entity within the same political subdivision. For instance, a city or municipality may use its local enforcement agency, so long as the local law enforcement agency satisfies the criteria in Requirement R6. The third party reviewer, however, must still be a third party and cannot be a division of the registered entity that operates as a functional unit.

The Responsible Entity can select from several possible entities to perform the review:

- *An entity or organization with electric industry physical security experience and whose review staff has at least one member who holds either a Certified Protection Professional (CPP) or Physical Security Professional (PSP) certification.*

  In selecting CPP and PSP for use in this standard, the SDT believed it was important that if a private entity such as a consulting or security firm was engaged to conduct the third party review, they must tangibly demonstrate competence to conduct the review. This includes electric industry physical security experience and either of the premier security industry certifications sponsored by ASIS International. The ASIS certification program was initiated in 1977, and those that hold the CPP certification are board certified in security management. Those that hold the PSP certification are board certified in physical security.

- *An entity or organization approved by the ERO.*

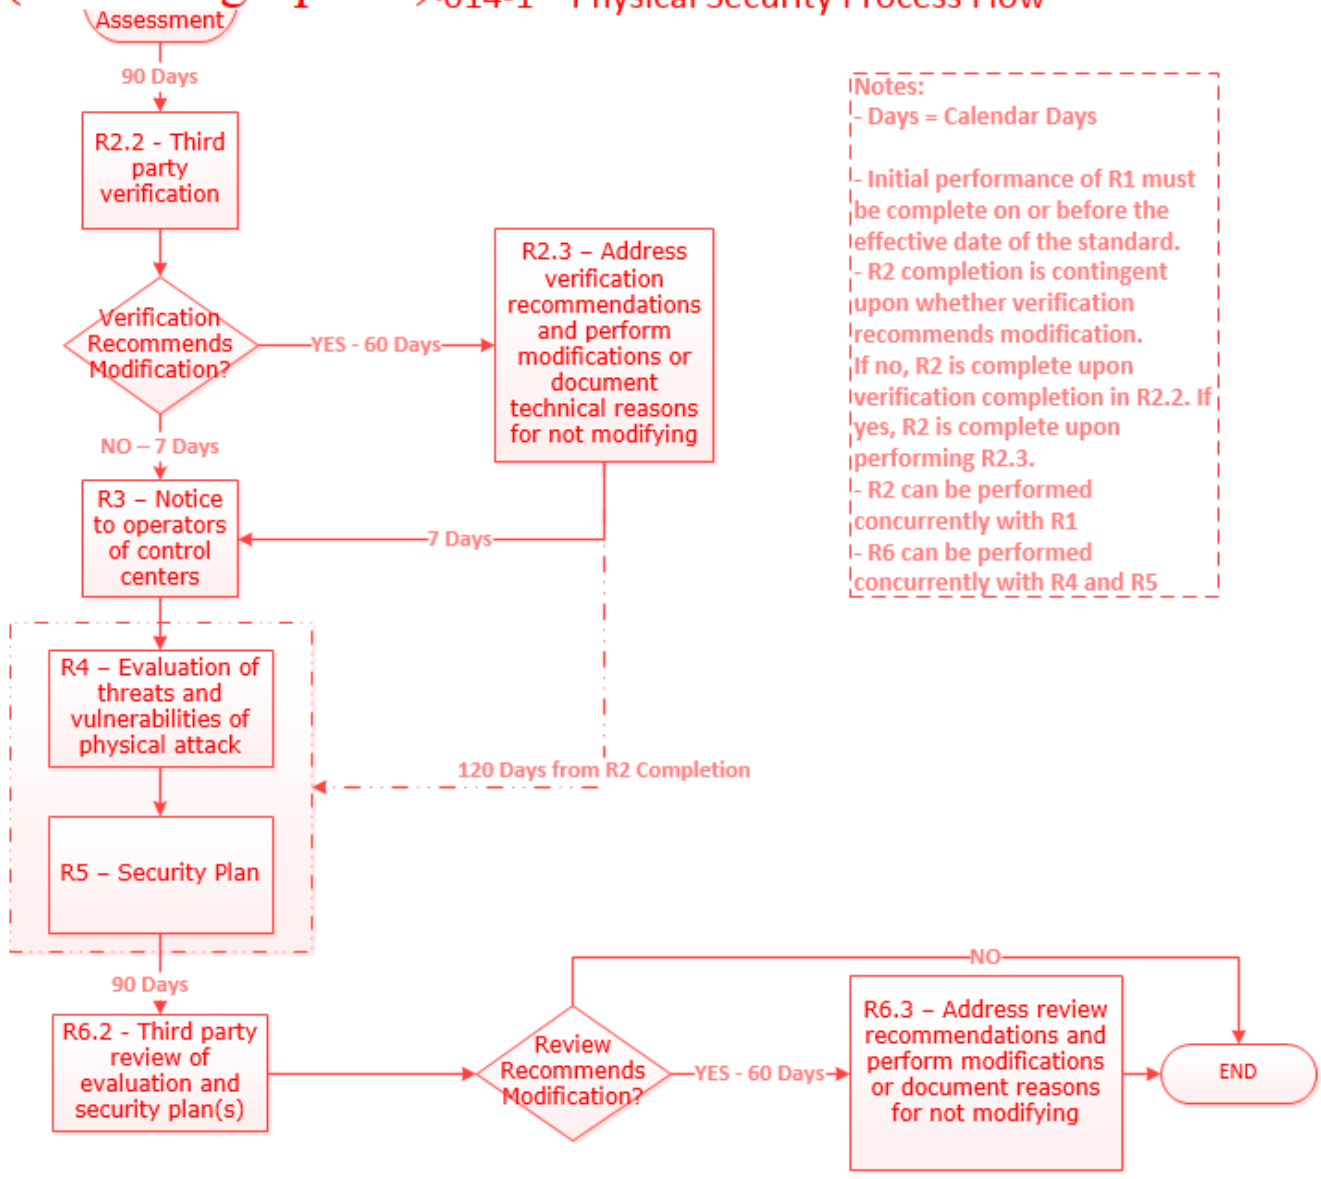
- *A governmental agency with physical security expertise.*

- *An entity or organization with demonstrated law enforcement, government, or military physical security expertise.*

As with the verification under Requirement R2, Requirement R6 provides that the "review may occur concurrently with or after completion of the evaluation performed under Requirement R4 and the security plan development under Requirement R5." This provision is designed to provide applicable Transmission Owners and Transmission Operators the flexibility to work with the third party reviewer throughout (*i.e.*, concurrent with) the evaluation performed according to Requirement R4 and the security plan(s) developed according to Requirement R5, which for some Responsible Entities may be more efficient and effective. In other words, a Transmission Owner or Transmission Operator could collaborate with their unaffiliated third party reviewer to perform an evaluation of potential threats and vulnerabilities (Requirement R4) and develop a security plan (Requirement R5) to satisfy Requirements R4 through R6 simultaneously. The intent of Requirement R6 is to have an entity other than the owner or operator of the facility to be involved in the Requirement R4 evaluation and the development of the Requirement R5 security plans and have an opportunity to provide input on the evaluation and the security plan. Accordingly, Requirement R6 is designed to allow entities the discretion to have a two-step process, where the Transmission Owner performs the evaluation and develops the security plan itself and then has a third party review that assessment, or a one-step process, where the entity collaborates with a third party to perform the evaluation and develop the security plan.

~~Timeline~~

(Deleted graphics)-014-1 – Physical Security Process Flow



Rationale

During development of this standard, text boxes were embedded within the standard to explain the rationale for various parts of the standard. Upon BOT approval, the text from the rationale text boxes was moved to this section.

Rationale for Requirement R1:
This requirement meets the FERC directive from paragraph 6 of its March 7, 2014 order on physical security to perform a risk assessment to identify which facilities if rendered inoperable or damaged could impact an Interconnection through instability, uncontrolled separation, or cascading failures. The requirement is not intended to bring within the scope of the standard a Transmission station or Transmission substation unless the applicable Transmission Owner determines through technical studies and analyses based on objective analysis, technical expertise, operating experience and experienced judgment that the loss of such facility would have a critical impact on the operation of the Interconnection in the event the asset is rendered inoperable or damaged. In the November 20, 2014 Order, FERC reiterated that "only an instability that has a "critical impact on the operation of the interconnection" warrants finding that the facility causing the instability is critical under Requirement R1." The Transmission Owner may determine the criteria for critical impact by considering, among other criteria, any of the following:

- Criteria or methodology used by Transmission Planners or Planning Coordinators in TPL-001-4, Requirement R6
- NERC EOP-004-2 reporting criteria
- Area or magnitude of potential impact

Requirement R1 also meets the FERC directive for periodic reevaluation of the risk assessment by requiring the risk assessment to be performed every 30 months (or 60 months for an entity that has not identified in a previous risk assessment any Transmission stations or Transmission substations that if rendered inoperable or damaged could result in instability, uncontrolled separation, or Cascading within an Interconnection).

After identifying each Transmission station and Transmission substation that meets the criteria in Requirement R1, it is important to additionally identify the primary control center that operationally controls that Transmission station or Transmission substation (*i.e.*, the control center whose electronic actions can cause direct physical actions at the identified Transmission station and Transmission substation, such as opening a breaker, compared to a control center that only has the ability to monitor the Transmission station and Transmission substation and, therefore, must coordinate direct physical action through another entity).

Rationale for Requirement R2:
This requirement meets the FERC directive from paragraph 11 in the order on physical security requiring verification by an entity other than the owner or operator of the risk assessment performed under Requirement R1.

This requirement provides the flexibility for a Transmission Owner to select registered and non-registered entities with transmission planning or analysis experience to perform the verification of the Requirement R1 risk assessment. The term "unaffiliated" means that the selected verifying entity cannot be a corporate affiliate (*i.e.*, the verifying entity cannot be an entity that controls, is controlled by, or is under common control with, the Transmission owner). The verifying entity also cannot be a division of the Transmission Owner that operates as a functional unit. The term "unaffiliated" is not intended to prohibit a governmental entity from using another government entity to be a verifier under Requirement R2.

Requirement R2 also provides the Transmission Owner the flexibility to work with the verifying entity throughout the Requirement R1 risk assessment, which for some Transmission Owners may be more efficient and effective. In other words, a Transmission Owner could coordinate with their unaffiliated verifying entity to perform a Requirement R1 risk assessment to satisfy both Requirement R1 and Requirement R2 concurrently.

Planning Coordinator is a functional entity listed in Part 2.1. The Planning Coordinator and Planning Authority are the same entity as shown in the NERC Glossary of Terms Used in NERC Reliability Standards.

Rationale for Requirement R3:

Some Transmission Operators will have obligations under this standard for certain primary control centers. Those obligations, however, are contingent upon a Transmission Owner first identifying which Transmission stations and Transmission substations meet the criteria specified by Requirement R1, as verified according to Requirement R2. This requirement is intended to ensure that a Transmission Operator that has operational control of a primary control center identified in Requirement R1, Part 1.2 of a Transmission station or Transmission substation verified according to Requirement R2 receives notice of such identification so that the Transmission Operator may timely fulfill its resulting obligations under Requirements R4 through R6. Since the timing obligations in Requirements R4 through R6 are based upon completion of Requirement R2, the Transmission Owner must also include notice of the date of completion of Requirement R2. Similarly, the Transmission Owner must notify the Transmission Operator of any removals from identification that result from a subsequent risk assessment under Requirement R1 or the verification process under Requirement R2.

Rationale for Requirement R4:

This requirement meets the FERC directive from paragraph 8 in the order on physical security that the reliability standard must require tailored evaluation of potential threats and vulnerabilities to facilities identified in Requirement R1 and verified according to Requirement R2. Threats and vulnerabilities may vary from facility to facility based on factors such as the facility's location, size, function, existing protections, and attractiveness of the target. As such, the requirement does not mandate a one-size-fits-all approach but requires entities to account for the unique characteristics of their facilities.

~~Requirement R4 does not explicitly state when the evaluation of threats and vulnerabilities must occur or be completed. However, Requirement R5 requires that the entity's security plan(s), which is dependent on the Requirement R4 evaluation, must be completed within 120 calendar days following completion of Requirement R2. Thus, an entity has the flexibility when to complete the Requirement R4 evaluation, provided that it is completed in time to comply with the requirement in Requirement R5 to develop a physical security plan 120 calendar days following completion of Requirement R2.~~

~~**Rationale for Requirement R5:**~~
~~This requirement meets the FERC directive from paragraph 9 in the order on physical security requiring the development and implementation of a security plan(s) designed to protect against attacks to the facilities identified in Requirement R1 based on the assessment performed under Requirement R4.~~

~~**Rationale for Requirement R6:**~~
~~This requirement meets the FERC directive from paragraph 11 in the order on physical security requiring review by an entity other than the owner or operator with appropriate expertise of the evaluation performed according to Requirement R4 and the security plan(s) developed according to Requirement R5.~~

~~As with the verification required by Requirement R2, Requirement R6 provides Transmission Owners and Transmission Operators the flexibility to work with the third party reviewer throughout the Requirement R4 evaluation and the development of the Requirement R5 security plan(s). This would allow entities to satisfy their obligations under Requirement R6 concurrent with the satisfaction of their obligations under Requirements R4 and R5.~~

~~**3.** Transmission Facilities at a single station or substation location that are identified by its Reliability Coordinator, Planning Coordinator, or Transmission Planner as critical to the derivation of Interconnection Reliability Operating Limits (IROLs) and their associated contingencies.~~

~~**4.** Transmission Facilities identified as essential to meeting Nuclear Plant Interface Requirements (NPIRs).~~

Attachment 1 – Applicability Criteria

Applicable Transmission station(s) or Transmission substation(s) are those that meet any of the following criteria:

1. Transmission Facilities operated at 500 kV or higher. For the purpose of this criterion, the collector bus for a generation plant is not considered a Transmission Facility, but is part of the generation interconnection Facility.

2. Transmission Facilities that are operating between 200 kV and 499 kV at a single station or substation, where the station or substation is connected at 200 kV or higher voltages to three or more other Transmission stations or substations and has an "aggregate weighted value" exceeding 3,000 according to the table below. The "aggregate weighted value" for a single station or substation is determined by summing the "weight value per line" shown in the table below for each incoming and each outgoing Bulk Electric System Transmission Line that is connected to another Transmission station or substation. For the purpose of this criterion, the collector bus for a generation plant is not considered a Transmission Facility, but is part of the generation interconnection Facility.

Voltage Value of a Line	Weight Value per Line
less than 200 kV (not applicable)	(not applicable)
200 kV to 299 kV	700
300 kV to 499 kV	1,300
500 kV and above	N/A

3. Transmission Facilities at a single station or substation location that are identified by their Reliability Coordinator, Planning Coordinator, or Transmission Planner as critical to the derivation of Interconnection Reliability Operating Limits (IROLs) and their associated contingencies.

4. Transmission Facilities identified as essential to meeting Nuclear Plant Interface Requirements (NPIRs).

NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

Implementation Plan

Project 2023-06 CIP-014 Risk Assessment Refinement
Reliability Standard CIP-014-4

Applicable Standard(s)

- CIP-014-4 Physical Security

Requested Retirement(s)

- CIP-014-3 Physical Security

Applicable Entities

- Transmission Owner that owns or jointly owns one or more Transmission stations or Transmission substations that meet the applicability criteria of Attachment 1.
- Transmission Operator

  Exemption: Facilities in a "protected area," as defined in 10 C.F.R. § 73.2, within the scope of a security plan approved or accepted by the Nuclear Regulatory Commission are not subject to this Standard; or Facilities within the scope of a security plan approved or accepted by the Canadian Nuclear Safety Commission are not subject to this Reliability Standard.

General Considerations

In developing this Implementation Plan, the Drafting Team (DT) has determined that 24 calendar months for the CIP-014-4 implementation plan would allow adequate time for Transmission Owners and Transmission Operators to determine applicability, develop criteria, write or revise methodologies, perform assessments, and procure unaffiliated third parties for risk assessment verification (which some Transmission Owners have performed concurrently with their risk assessment analyses).

In determining an appropriate time frame, the DT considered: (1) the severity of the concerns highlighted in the FERC December 2022 order,[1] which directed NERC to evaluate the effectiveness of CIP-014-3 in mitigating the risks to the bulk power system associated with physical attacks; (2) the recommendations of the NERC report entitled Evaluation of the Physical Security Reliability Standard and Physical Security Attacks to the Bulk-Power System;[2] and (3) the Standard Authorization Request requirement that the DT correct any discrepancies between the study period, frequency of study, and the base case(s) a Transmission Owner uses. The DT determined that an Implementation Plan schedule of 24 calendar months appropriately balances the reliability

[1] *N. Am. Elec. Reliability Corp.*, 181 FERC ¶ 61,230 (2022).
[2] *See* NERC Report on CIP-014-3.pdf, filed with FERC on April 14, 2023).

need and risks against the time and resources required of entities to determine applicability, develop criteria, write or revise methodologies, perform assessments, and procure unaffiliated third parties for risk assessment verification.

Effective Date of CIP-014-4

Where approval by an applicable governmental authority (AGA) is required, Reliability Standard CIP-014-4 shall become effective on the first day of the first calendar quarter that is 24 calendar months after the effective date of the AGA's order approving the standard or as otherwise provided for by the AGA.

Where approval by an AGA is not required, Reliability Standard CIP-014-4 shall become effective on the first day of the first calendar quarter that is 24 calendar months after the date the standard is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.

Initial Performance of Periodic Requirements

The initial risk assessment required by Reliability Standard CIP-014-4 Requirement R5, must be completed on or before the effective date of the standard. Subsequent risk assessments shall be performed no later than 36 calendar months following the effective date of Reliability Standard CIP-014-4.

Retirement Date

Reliability Standard CIP-014-3 shall be retired immediately prior to the effective date of Reliability Standard CIP-014-4 in the particular jurisdiction in which the revised standard is becoming effective.

[2] *See* NERC Report on CIP-014-3.pdf, filed with FERC on April 14, 2023).

case(s) a Transmission Owner uses. The DT determined that an Implementation Plan schedule of 24 calendar months appropriately balances the reliability need and risks against the time and resources required of entities to determine applicability, develop criteria, write or revise methodologies, perform assessments, and procure unaffiliated third parties for risk assessment verification.

Effective Date of CIP-014-4

Where approval by an applicable governmental authority (AGA) is required, Reliability Standard CIP-014-4 shall become effective on the first day of the first calendar quarter that is 24 calendar months after the effective date of the AGA's order approving the standard or as otherwise provided for by the AGA.

Where approval by an AGA is not required, Reliability Standard CIP-014-4 shall become effective on the first day of the first calendar quarter that is 24 calendar months after the date the standard is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.

Initial Performance of Periodic Requirements

The initial risk assessment required by Reliability Standard CIP-014-4 Requirement R5, must be completed on or before the effective date of the standard. Subsequent risk assessments shall be performed no later than 36 calendar months following the effective date of Reliability Standard CIP-014-4.

Retirement Date

Reliability Standard CIP-014-3 shall be retired immediately prior to the effective date of Reliability Standard CIP-014-4 in the particular jurisdiction in which the revised standard is becoming effective.

NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

Technical Rationale

Project 2023-06 CIP-014 Risk Assessment Refinement
Reliability Standard CIP-014-4 | May 2026

CIP-014-4 – Physical Security

In performing the risk assessment, the Transmission Owner (TO) should first identify their population of Transmission stations and Transmission substations that meet the criteria contained in Attachment 1. The Standard requires the TO to perform a risk assessment, consisting of transmission analyses to determine which of those Transmission stations and Transmission substations, if rendered inoperable or damaged, could result in instability, uncontrolled separation, or Cascading within an Interconnection.

The purpose of Reliability Standard CIP-014 is to protect Transmission stations and Transmission substations, and their associated primary control centers, that if rendered inoperable or damaged, due to a physical attack, could cause instability, uncontrolled separation, or Cascading within an Interconnection. To properly identify candidates for such Transmission station(s) and Transmission substation(s), the TO shall evaluate the criteria listed in Attachment 1.

Rationale for Requirement R1

The Standard Authorization Request (SAR) directed the drafting team (DT) to clarify the in-service window. It also directed the DT to correct any discrepancies between the study period, frequency of study, and the base case(s) a TO uses. In the previous version of CIP-014, the 30-month time frame and the 24-month planned-to-be-in-service date could, if not carefully applied, lead to gaps between models and study horizons. Per the SAR, CIP-014-4 has consolidated these multiple timelines into one.

Requirement R1 is revised to ensure that each TO establishes a list of applicable Transmission station(s) or Transmission substation(s) in accordance with Attachment 1. Aligning the 36 calendar months look ahead in Requirement R1 with the 36 calendar months risk assessment cycle ensures that system topology of the cases used to assess applicability is consistent with the system topology in the risk assessment models.

TOs shall review and, if necessary, update the list of applicable Transmission station(s) or Transmission substation(s) per Attachment 1 at least once every 36 calendar months. The list of applicable Transmission station(s) or Transmission substation(s) shall include existing Facilities and Transmission station(s) and Transmission substation(s) planned to be in service within 36 calendar months. The 36 calendar months risk assessment study cycle aligns with the 36 calendar months planned-to-be-in-service date. "Planned to be in-service" should be taken to mean all Transmission station(s) and Transmission substation(s) as modeled in the base cases.

Rationale for Requirement R2

The distance chosen in Requirement R2 is based on guidelines that considered a variety of plausible attack scenarios capable of rendering a substation inoperable.

The DT chose 1,500 feet or 457 meters (the shortest distance, measured substation fence line to substation fence line) in Requirement R2 after review of the Department of Homeland Security (DHS)-Department of Justice (DOJ) Bomb Threat Stand-Off Card. The Bomb Threat Stand-Off Card is a quick reference guide providing recommended evacuation and shelter-in-place distances for various types and sizes of Improvised Explosive Devices (IED), based on version of August 2025.[1]

The guidance above allowed the DT to draft language that clarified what study scenario(s) and other study assumptions are appropriate and reasonable considering the intent of CIP-014 and the potential range of issues during a physical attack. Simulations should incorporate the loss of station elements without the reliance on local system protection. Clarifying how to account for adjacent Transmission stations or Transmission substations of differing ownership as well as for those Transmission stations or Transmission substations within line-of-sight to each other. These provide limits to what the TO must study and avoid including an explicit representation of the physical event in the standard.

Accurate simulation of the event was deemed a priority of the DT. The DT felt that ownership of proximate substations, as identified in Requirement R2, was irrelevant to Bulk Electric System impact.

The Transmission station(s) or Transmission substation(s) identified in Requirement R2 are only intended for use in the Requirement R5 risk assessment and the Requirement R6 third-party verification to properly account for additional equipment that, if also damaged during an event, could lead to loss of additional Facilities. They are not intended to be subject to Requirements R7 through R10. Requirements R7 through R10 are only relevant for the Transmission station(s) or Transmission substation(s) identified in Requirement R1.

Rationale for Requirement R3

The new Requirement R3 fulfills the first item in the SAR to "clarify the risk assessment methods" and that the "methods should account for dynamic studies." Requirement R3 also fulfills other items in the SAR around case selection, technically supported rationales, the loss of communications, and local protection within the affected station. The previous Requirement R3 is now Requirement R7 of CIP-014-4.

Per Requirement R3, each TO is required to have a risk assessment methodology, including the criteria by which analytical results will be examined to identify Transmission station(s) or Transmission substation(s) that if rendered inoperable or damaged as a result of a physical attack could result in instability, uncontrolled separation, or Cascading within an Interconnection. The TO is not required to develop its own methodology and is free to use a methodology developed elsewhere, such as in coordination with neighboring TOs or Independent System Operators (ISOs).

Rationale for Requirement R3, Part 3.1

TOs should determine the amount of unacceptable load loss and generation loss within an Interconnection when determining the impact of an event to the Transmission system. The thresholds

[1] https://www.cisa.gov/resources-tools/resources/dhs-doj-bomb-threat-stand-card

identifying unacceptable generation and load losses should be the total of the losses within the TO's footprint and losses external to the TO's footprint. Criteria for measures such as load loss or generation loss should consider the impact to the Interconnection.

While the use of Recommended Interconnection Resource Loss Protection Criteria (RLPC) provides one approach to generation loss—setting these thresholds based on the two largest potential resource losses in an Interconnection as detailed in Attachment A of NERC Reliability Standard BAL-003-2—other methods may also be appropriate, as determined by the TO. The RLPC values should be taken from the latest approved version of NERC's annual 'Frequency Response Annual Analysis' report.

Use of the RLPC recommendations in accordance with the latest version of NERC's 'Frequency Response Annual Analysis' report is an example of technically justified thresholds for unacceptable generation and load loss within an Interconnection. Use of lower values than the RLPC recommendations is also technically justifiable. Use of higher values than the RLPC recommendations would require additional technical justification.

Large loss of generation or load due to the evaluated disturbance could result in severe System impacts. The documented risk assessment methodology shall include the amount of unacceptable load loss and generation loss, that could result in instability, uncontrolled separation, or Cascading within an Interconnection. Conditions and thresholds used for determining critical Transmission station(s) or Transmission substation(s), i.e., those that if rendered inoperable or damaged as a result of a physical attack could result in instability, uncontrolled separation, or Cascading within an Interconnection, should be part of the documented risk assessment methodology.

It is up to the TO to identify post-event measures that can be used to assess the criticality of a Transmission station or Transmission substation. Suggested measures are listed below. A TO can decide that one or more of the items are not applicable to their location within the interconnection and if any additional items should be included.

The following parameters can be used to evaluate the steady-state and/or dynamic analysis:

- Steady state voltages
- Transient voltage response
- Thermal loading of Facilities
- Relay loadability
- Rotor angle stability
- Frequency exceeding generator limits
- Frequency stability
- Acceptable damping of oscillations
- Cascading line tripping

- Steady-state voltage stability

Rationale for Requirement R3, Part 3.2
The performance of both steady state and dynamics simulations is required for all applicable Transmission station(s) and substation(s). Dynamic simulations are required by the standard because exclusively performing steady-state simulations is insufficient for determining whether the loss of a Transmission station or Transmission substation could result in instability, uncontrolled separation, or Cascading within an Interconnection.

Rationale for Requirement R3, Part 3.3
Historically, simulation of a three-phase Fault at applicable Transmission station(s) and Transmission substation(s) appears to be the prevalent assumption used by the majority of TOs in the performance of stability analyses for CIP-014 risk assessments. The DT has determined, however, that there may be specific locations or scenarios that merit the use of a different Fault type (or a sequence or progression of multiple Faults) more consistent with the occurrence of a physical attack for those locations or scenarios.

Rationale for Requirement R3, Part 3.3.1
The applicable Transmission substation or Transmission station is the station that is assumed to be under attack for the purposes of this standard. Any damage to Transmission stations or Transmission substations in proximity is assumed to be collateral damage. The intent of CIP-014 is to cover the case when the applicable Transmission station or Transmission substation becomes inoperable. The SAR refers to the "total loss of communication and protection equipment at the substation." Requirement R3, Part 3.3.1 uses the "prior loss" wording to eliminate difficulties when performing simulations. When exploring possible attack scenarios, it is possible to develop scenarios that allow a fault prior to the loss of communication and protection systems. Protection systems typically operate within a few cycles, so a short delay between the fault and the loss of the protection system could allow breakers to operate. "Prior loss of communication and Protection Systems" eliminates this possibility, so the fault should be studied without the availability of local communications or Protection Systems. The use of delayed clearing times, typically Zone 2, is necessary because the applicable substation has lost local protection and all communications with other substations.

Rationale for Requirement R3, Part 3.3.2
The relative locations of the applicable Transmission station or Transmission substation and the neighboring substation will determine the best way to evaluate and study the combinations of substations. Every substation identified in Requirement R2 must be studied in at least one combination with its applicable Transmission station or Transmission substation. For example, if there is a single neighboring substation near the applicable substation, then the applicable and neighboring substation should be studied together. If there are two or more neighboring substations that are close together and both within 1,500 feet of the applicable substation, then the responsible entity may study the applicable substation with the combination of the two neighbors. If there are two or more neighboring substations on different sides of the applicable substation, then it can make more sense to study the applicable substation with each proximity substation individually. For purposes of the simulations, the faults should be applied at the same time or after the faults applied to the applicable Transmission station or

Transmission substation depending on the simulated event and any restrictions of the simulation software. Not all software packages allow for multiple simultaneous faults. The protection and communication systems at the proximate substations are expected to operate normally, so delayed clearing is not necessary.

Rationale for Requirement R3, Part 3.3.3
The DT believes that requiring documented justification for Faults being selected, without specifying Fault type, allows TOs to determine on a location-by-location basis what is a credible high-severity scenario for a physical attack and furthermore how to appropriately model the associated stability simulations. The DT also believes that a single justification may be used for multiple locations. Requirement 3 Part 3.3.3 allows the TOs to determine the type of fault with documented justification. If a fault type and justification is relevant to multiple Transmission stations or Transmission substations, there is no need to repeatedly document the same justification.

Rationale for Requirement R3, Part 3.3.4
Each simulation should include the removal of all Elements that Protection Systems and other controls are expected to automatically disconnect for the event. After the prior loss of communication and Protection Systems at the applicable Transmission station or Transmission substation, other Protection Systems should operate as expected for the event considered. The accurate simulation of Protection System actions is essential for correctly identifying the risk of instability, uncontrolled separation, or Cascading within an Interconnection.

Rationale for Requirement R3, Part 3.3.5
While there are commonly used generic clearing times for remote clearing that are consistent across the industry, actual clearing times can be shorter or longer depending on conditions and design considerations at an individual TO. The difference of a few cycles can have a significant impact on the transient behavior of generating units, therefore, it is required that the risk analysis use actual or more conservative clearing times.

Rationale for Requirement R4
Joint ownership of Transmission substations and Transmission stations was discussed in the Guidelines and Technical Basis of previous versions of the CIP-014-3 standard, but because ownership was not addressed in the standard language, the CIP-014-4 Risk Assessment Refinement SAR required clarification which resulted in the new requirement R4. TOs that have applicable jointly owned Transmission substations and Transmission stations should coordinate and document their individual and joint responsibilities for CIP-014-4 Requirements R3 and R5. TOs should be able to demonstrate sole or joint ownership through one-line diagrams with ownership demarcations and/or a letter of attestation stating which stations are solely or jointly owned.

Rationale for Requirement R5
An objective of the CIP-014-3 Risk Assessment Refinement SAR was to align study periods, frequency of studies, and the powerflow models used for the studies. A 36-month periodicity was chosen for the Requirement R5 risk assessment to reduce the periodicity options from previous versions of the standard.

Additionally, a single study periodicity is more easily aligned with project in-service date considerations and model choices. As called for in Project Scope item 3 of the CIP-014-3 Risk Assessment Refinement SAR, the risk assessment must comply with the methodology developed in Requirement R3, so this language was explicitly added to Requirement R5.

TOs shall review and, if necessary, update the list of applicable Transmission station(s) or Transmission substation(s) per Attachment 1 at least once every 36 months. The list of applicable Transmission station(s) and Transmission substation(s) shall include existing or planned to be in service within 36 months Transmission station(s) and Transmission substation(s). The 36-month cycle for updating the list of applicable Transmission station(s) or Transmission substation(s) per Attachment 1 aligns with the annual cycle for performing Planning Assessments per NERC Standard TPL-001. The 36-month risk assessment study cycle aligns with the 36-month planned-to-be-in-service date.

In addition to the performance of the risk assessment using Transmission station(s) and Transmission substation(s) identified in Requirement R1, any proximate Transmission station(s) and Transmission substation(s) identified in Requirement R2 should also be included in the risk assessment. Furthermore, any Transmission station(s) and Transmission substation(s) assessed due to having been identified per Requirement R1 should also be run as part of a proximate Transmission station(s) and Transmission substation(s) group per Requirement R2 if such an identification is made.

Rationale for Requirement R5, Part 5.1
If a TO performs a steady state analysis and identifies a Transmission station or substation that, if rendered inoperable or damaged, could result in instability, uncontrolled separation, or Cascading within an Interconnection, then dynamic analysis is not required for that Transmission station or substation. If a TO performs a dynamic analysis and identifies a Transmission station or substation that, if rendered inoperable or damaged, could result in instability, uncontrolled separation, or Cascading within an Interconnection, then steady state analysis is not required for that Transmission station or substation.

Rationale for Requirement R5, Part 5.2
The intent of this Requirement is that TOs do not have to reassess already identified and protected Transmission stations or substations (Requirement R5 Part 5.3 and Requirements R7 through R10 still apply to those Transmission stations or substations). A new risk assessment will need to be performed if the TO wishes to determine whether or not a Transmission station or substation can be removed from identification and protection as outlined in Requirement R7 Part 7.1.

Rationale for Requirement R5, Part 5.3
Identification of Primary Control Centers: After completing the risk assessment under Requirement R5 and verified under Requirement R6, it is important to additionally identify the primary control center that operationally controls each Transmission station or Transmission substation, that if rendered inoperable or damaged could result in instability, uncontrolled separation, or Cascading within an Interconnection. A primary control center “operationally controls” a Transmission station or Transmission substation when the control center’s electronic actions can cause direct physical actions at the identified Transmission station and Transmission substation, such as opening a breaker.

Rationale for Implementation Plan

In developing the Implementation Plan, the DT has determined that 24 calendar months for the CIP-014-4 implementation plan would allow adequate time for TOs and Transmission Operators (TOPs) to determine applicability, develop criteria, write or revise methodologies, perform assessments, and procure unaffiliated third parties for risk assessment verification (which some TOs have performed concurrently with their risk assessment analyses.

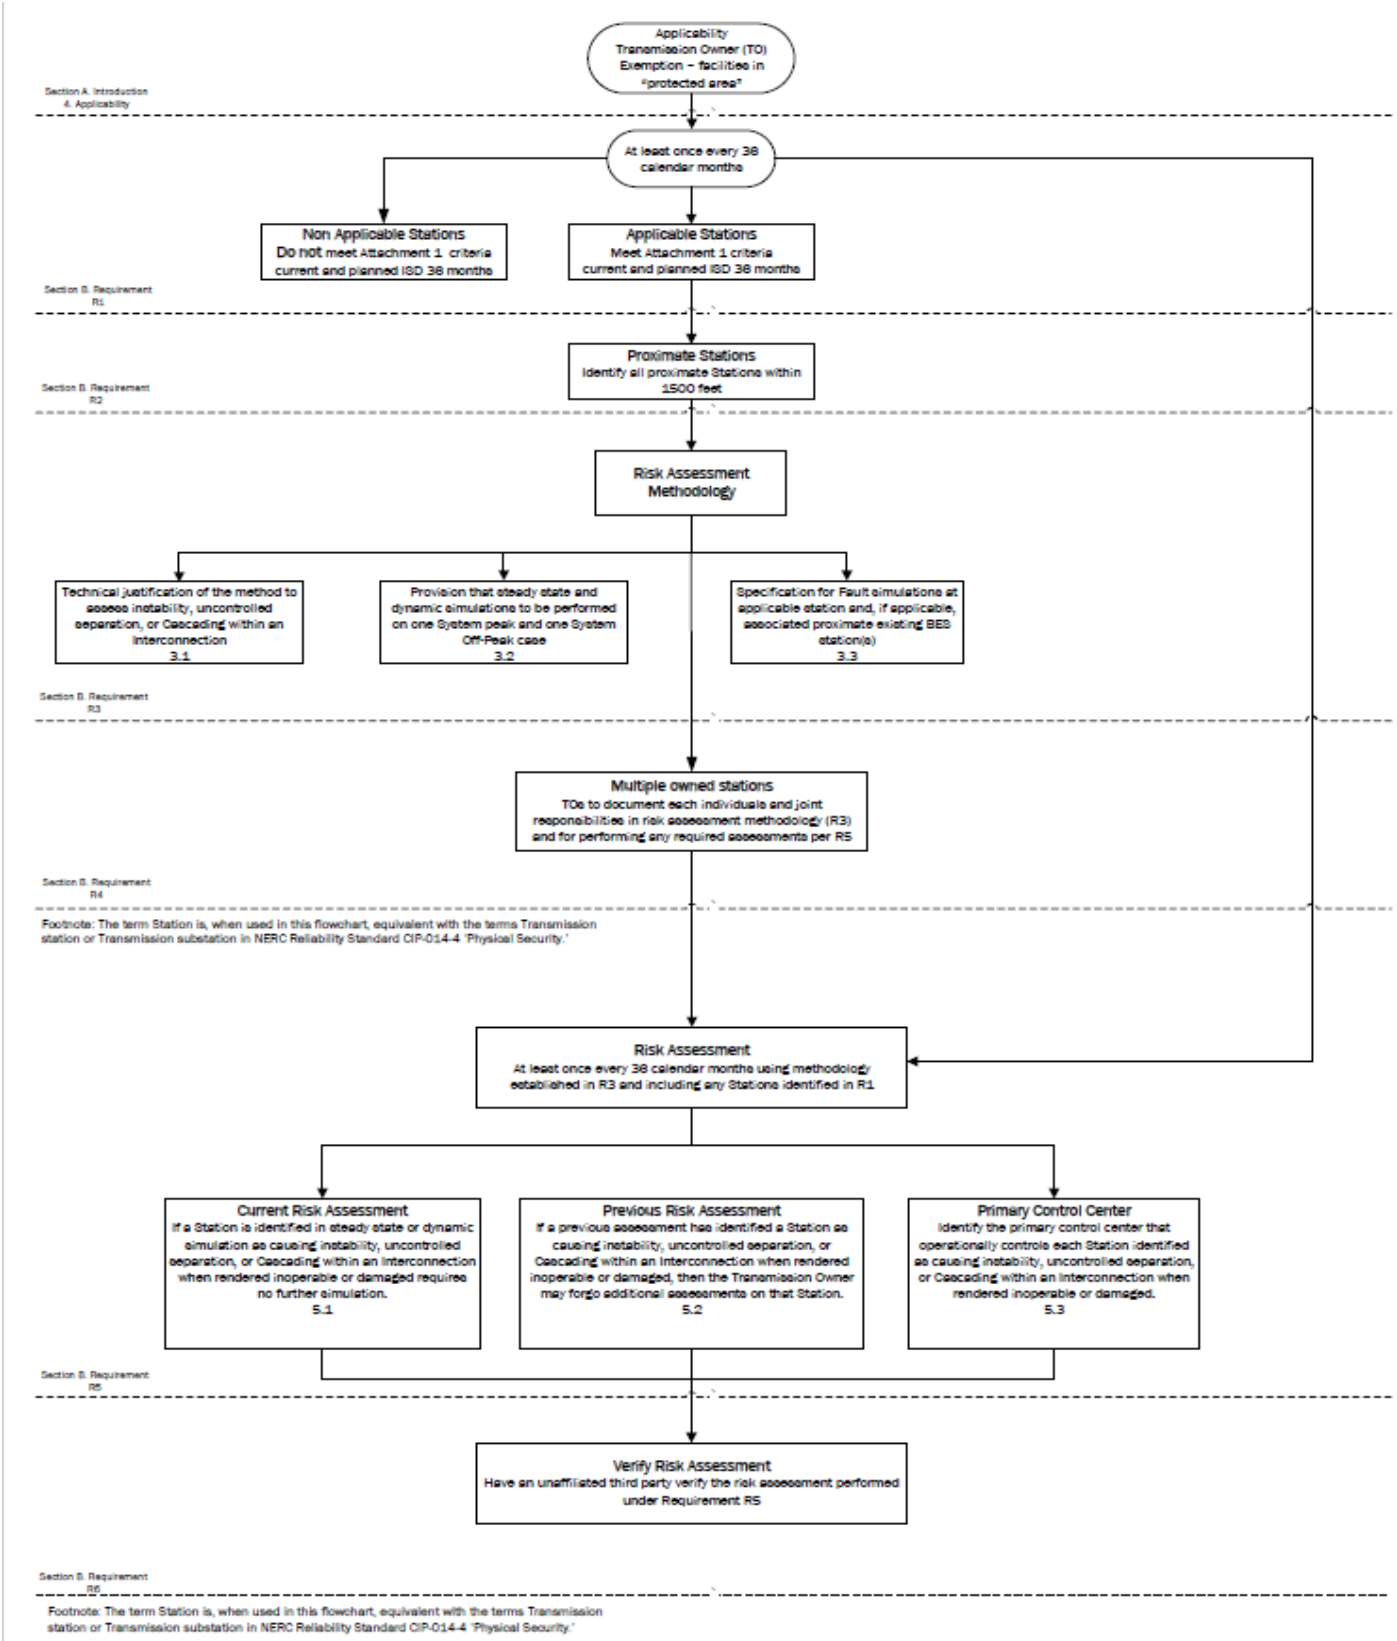
Furthermore, given a) FERC's sense of urgency stated in their December 2022 order,[2] which directed NERC to evaluate the effectiveness of CIP-014-3 in mitigating the risks to the bulk power system associated with physical attacks, b) the findings of NERC's report to FERC on April 14, 2023 (Evaluation of the Physical Security Reliability Standard and Physical Security Attacks to the Bulk-Power System)[3], and c) the designation of Project 2023-06 as High Priority, the DT has determined that an Implementation Plan schedule of greater than 24 calendar months would not be responsive to the risks identified with sufficient urgency, and thus 24 calendar months is an appropriate timeframe. While the DT understands the time and resources required of entities to respond to this Implementation Plan, the DT believes that 24 calendar months properly balances the need to address the reliability risk and the time needed by entities to determine applicability, develop criteria, write or revise methodologies, perform assessments, and procure unaffiliated third parties for risk assessment verification.

CIP-014-4 Flowchart

The flowchart is a concise outline that guides through the steps for completing the risk assessment at least once every 36 calendar months, based on the Applicability in Attachment 1 and Requirements R1-R5.

[2] *N. Am. Elec. Reliability Corp.*, 181 FERC ¶ 61,230 (2022).

[3] *See* NERC Report on CIP-014-3.pdf, filed with FERC on April 14, 2023).



Applicability
Transmission Owner (TO) Exemption – facilities in "protected area"
Section A. Introduction 4. Applicability
At least once every 38 calendar months
Non Applicable Stations
Do not meet Attachment 1 criteria current and planned ISD 38 months
Applicable Stations
Meet Attachment 1 criteria current and planned ISD 38 months
Section B. Requirement R1
Proximate Stations
Identify all proximate Stations within 1500 feet
Section B. Requirement R2
Risk Assessment Methodology
Technical justification of the method to assess instability, uncontrolled separation, or Cascading within an Interconnection 3.1
Provision that steady state and dynamic simulations to be performed on one System peak and one System Off-Peak case 3.2
Specification for Fault simulations at applicable station and, if applicable, associated proximate existing BES station(s) 3.3
Section B. Requirement R3
Multiple owned stations
TOs to document each individuals and joint responsibilities in risk assessment methodology (R3) and for performing any required assessments per R5
Section B. Requirement R4
Footnote: The term Station is, when used in this flowchart, equivalent with the terms Transmission station or Transmission substation in NERC Reliability Standard CIP-014-4 'Physical Security.'
Risk Assessment
At least once every 38 calendar months using methodology established in R3 and including any Stations identified in R1
Current Risk Assessment
If a Station is identified in steady state or dynamic simulation as causing instability, uncontrolled separation, or Cascading within an Interconnection when rendered inoperable or damaged requires no further simulation. 5.1
Previous Risk Assessment
If a previous assessment has identified a Station as causing instability, uncontrolled separation, or Cascading within an Interconnection when rendered inoperable or damaged, then the Transmission Owner may forgo additional assessments on that Station. 5.2
Primary Control Center
Identify the primary control center that operationally controls each Station identified as causing instability, uncontrolled separation, or Cascading within an Interconnection when rendered inoperable or damaged. 5.3
Section B. Requirement R5
Verify Risk Assessment
Have an unaffiliated third party verify the risk assessment performed under Requirement R5
Section B. Requirement R6
Footnote: The term Station is, when used in this flowchart, equivalent with the terms Transmission station or Transmission substation in NERC Reliability Standard CIP-014-4 'Physical Security.'

Technical Rationale for Reliability Standard CIP-014-3

This section contains a "cut and paste" of the former Guidelines and Technical Basis (GTB) as-is of from CIP-014-3 standard to preserve any historical references. No modifications have been made.

Requirement R2 (This is Requirement R6 in CIP-014-4)
This requirement specifies verification of the risk assessment performed under Requirement R1 by an entity other than the owner or operator of the Requirement R1 risk assessment.

A verification of the risk assessment by an unaffiliated third party, as specified in Requirement R2, could consist of:

1. Certifying that the Requirement R1 risk assessment considers the Transmission stations and Transmission substations identified in Applicability Section 4.1.1.
2. Review of the model used to conduct the risk assessment to ensure it contains sufficient system topology to identify Transmission stations and Transmission substations that if rendered inoperable or damaged could cause instability, uncontrolled separation, or Cascading within an Interconnection.
3. Review of the Requirement R1 risk assessment methodology.

This requirement provides the flexibility for a TO to select from unaffiliated registered and non-registered entities with transmission planning or analysis experience to perform the verification of the Requirement R1 risk assessment. The term unaffiliated means that the selected verifying entity cannot be a corporate affiliate (i.e., the verifying or third party reviewer cannot be an entity that corporately controls, is controlled by, or is under common control with the TO). The verifying entity also cannot be a division of the TO that operates as a functional unit.

The prohibition on registered entities using a corporate affiliate to conduct the verification, however, does not prohibit a governmental entity (e.g., a city, a municipality, a U.S. federal power marketing agency, or any other political subdivision of U.S. or Canadian federal, state, or provincial governments) from selecting as the verifying entity another governmental entity within the same political subdivision. For instance, a U.S. federal power marketing agency may select as its verifier another U.S. federal agency to conduct its verification so long as the selected entity has transmission planning or analysis experience. Similarly, a TO owned by a Canadian province can use a separate agency of that province to perform the verification. The verifying entity, however, must still be a third party and cannot be a division of the registered entity that operates as a functional unit.

Requirement R2 also provides that the "verification may occur concurrent with or after the risk assessment performed under Requirement R1." This provision is designed to provide the TO the flexibility to work with the verifying entity throughout (i.e., concurrent with) the risk assessment, which for some TOs may be more efficient and effective. In other words, a TO could collaborate with their unaffiliated verifying entity to perform the risk assessment under Requirement R1 such that both Requirement R1 and

Requirement R2 are satisfied concurrently. The intent of Requirement R2 is to have an entity other than the owner or operator of the facility to be involved in the risk assessment process and have an opportunity to provide input. Accordingly, Requirement R2 is designed to allow entities the discretion to have a two-step process, where the TO performs the risk assessment and subsequently has a third party review that assessment, or a one-step process, where the entity collaborates with a third party to perform the risk assessment.

Characteristics to consider in selecting a third party reviewer could include:

- Registered Entity with applicable planning and reliability functions.
- Experience in power system studies and planning.
- The entity's understanding of the MOD standards, TPL standards, and facility ratings as they pertain to planning studies.
- The entity's familiarity with the Interconnection within which the TO is located.

With respect to the requirement that TO develop and implement procedures for protecting confidential and sensitive information, the TO could have a method for identifying documents that require confidential treatment. One mechanism for protecting confidential or sensitive information is to prohibit removal of sensitive or confidential information from the TO's site. TOs could include such a prohibition in a non-disclosure agreement with the verifying entity.

A Technical feasibility study is not required in the Requirement R2 documentation of the technical basis for not modifying the identification in accordance with the recommendation.

On the issue of the difference between a verifier in Requirement R2 and a reviewer in Requirement R6, the DT indicates that the verifier will confirm that the risk assessment was completed in accordance with Requirement R1, including the number of Transmission stations and substations identified, while the reviewer in Requirement R6 is providing expertise on the manner in which the evaluation of threats was conducted in accordance with Requirement R4, and the physical security plan in accordance with Requirement R5. In the latter situation there is no verification of a technical analysis, rather an application of experience and expertise to provide guidance or recommendations, if needed.

Parts 2.4 and 6.4 require the entities to have procedures to protect the confidentiality of sensitive or confidential information. Those procedures may include the following elements:

1. Control and retention of information on site for third party verifiers/reviewers.
2. Only "need to know" employees, etc., get the information.
3. Marking documents as confidential
4. Securely storing and destroying information when no longer needed.
5. Not releasing information outside the entity without, for example, General Counsel sign-off.

Requirement R3 (This is now Requirement R7 in CIP-014-4)
Some TOPs will have obligations under this standard for certain primary control centers. Those obligations, however, are contingent upon a Transmission Owner(TO) first completing the risk assessment specified by Requirement R1 and the verification specified by Requirement R2. Requirement R3 is intended to ensure that a TOP that has operational control of a primary control center identified in Requirement R1 receive notice so that the TOP may fulfill the rest of the obligations required in Requirements R4 through R6. Since the timing obligations in Requirements R4 through R6 are based upon completion of Requirement R2, the TO must also include within the notice the date of completion of Requirement R2. Similarly, the TO must notify the TOP of any removals from identification that result from a subsequent risk assessment under Requirement R1 or as a result of the verification process under Requirement R2.

Requirement R4 (This is now Requirement R8 in CIP-014-4)
This requirement requires owners and operators of facilities identified by the Requirement R1 risk assessment and that are verified under Requirement R2 to conduct an assessment of potential threats and vulnerabilities to those Transmission stations, Transmission substations, and primary control centers using a tailored evaluation process. Threats and vulnerabilities may vary from facility to facility based on any number of factors that include, but are not limited to, location, size, function, existing physical security protections, and attractiveness as a target.

In order to effectively conduct a threat and vulnerability assessment, the asset owner may be the best source to determine specific site vulnerabilities, but current and evolving threats may best be determined by others in the intelligence or law enforcement communities. A number of resources have been identified in the standard, but many others exist and asset owners are not limited to where they may turn for assistance. Additional resources may include state or local fusion centers, U.S. Department of Homeland Security, Federal Bureau of Investigations (FBI), Public Safety Canada, Royal Canadian Mounted Police, and InfraGard chapters coordinated by the FBI.

The Responsible Entity is required to take a number of factors into account in Parts 4.1 to 4.3 in order to make a risk-based evaluation under Requirement R4.

To assist in determining the current threat for a facility, the prior history of attacks on similarly protected facilities should be considered when assessing probability and likelihood of occurrence at the facility in question.

Resources that may be useful in conducting threat and vulnerability assessments include:

- NERC Security Guideline for the Electricity Sector: Physical Security.
- NERC Security Guideline: Physical Security Response.
- ASIS International General Risk Assessment Guidelines.
- ASIS International Facilities Physical Security Measure Guideline.
- ASIS International Security Management Standard: Physical Asset Protection.

- Whole Building Design Guide - Threat/Vulnerability Assessments.

Requirement R5 (This is now Requirement R9 in CIP-014-4)
This requirement specifies development and implementation of a security plan(s) designed to protect against attacks to the facilities identified in Requirement R1 based on the assessment performed under Requirement R4.

Requirement R5 specifies the following attributes for the physical security plan:

- *Resiliency or security measures designed collectively to deter, detect, delay, assess, communicate, and respond to potential physical threats and vulnerabilities identified during the evaluation conducted in Requirement R4.*

  Resiliency may include, among other things:

  a. System topology changes,

  b. Spare equipment,

  c. Construction of a new Transmission station or Transmission substation.

  While most security measures will work together to collectively harden the entire site, some may be allocated to protect specific critical components. For example, if protection from gunfire is considered necessary, the entity may only install ballistic protection for critical components, not the entire site.

- *Law enforcement contact and coordination information.*

  Examples of such information may be posting 9-1-1 for emergency calls and providing substation safety and familiarization training for local and federal law enforcement, fire department, and Emergency Medical Services.

- *A timeline for executing the physical security enhancements and modifications specified in the physical security plan.*

  Entities have the flexibility to prioritize the implementation of the various resiliency or security enhancements and modifications in their security plan according to risk, resources, or other factors. The requirement to include a timeline in the physical security plan for executing the actual physical security enhancements and modifications does not also require that the enhancements and modifications be completed within 120 days. The actual timeline may extend beyond the 120 days, depending on the amount of work to be completed.

- *Provisions to evaluate evolving physical threats, and their corresponding security measures, to the Transmission station(s), Transmission substation(s), or primary control center(s).*

  A registered entity's physical security plan should include processes and responsibilities for obtaining and handling alerts, intelligence, and threat warnings from various sources. Some of these sources could include the ERO, E-ISAC, and US and/or Canadian federal agencies. This information should be used to reevaluate or consider changes in the security plan and corresponding security measures of the security plan found in R5.

Incremental changes made to the physical security plan prior to the next required third party review do not require additional third party reviews.

Requirement R6 (This is now Requirement R10 in CIP-014-4)
This requirement specifies review by an entity other than the TO or TOP with appropriate expertise for the evaluation performed according to Requirement R4 and the security plan(s) developed according to Requirement R5. As with Requirement R2, the term unaffiliated means that the selected third party reviewer cannot be a corporate affiliate (*i.e.,* the third party reviewer cannot be an entity that corporately controls, is controlled by or is under common control with, the TOP). A third party reviewer also cannot be a division of the TOP that operates as a functional unit.

As noted in the guidance for Requirement R2, the prohibition on registered entities using a corporate affiliate to conduct the review, however, does not prohibit a governmental entity from selecting as the third party reviewer another governmental entity within the same political subdivision. For instance, a city or municipality may use its local enforcement agency, so long as the local law enforcement agency satisfies the criteria in Requirement R6. The third party reviewer, however, must still be a third party and cannot be a division of the registered entity that operates as a functional unit.

The Responsible Entity can select from several possible entities to perform the review:

- *An entity or organization with electric industry physical security experience and whose review staff has at least one member who holds either a Certified Protection Professional or Physical Security Professional certification.*

  In selecting Certified Protection Professional and Physical Security Professional for use in this standard, the DT believed it was important that if a private entity such as a consulting or security firm was engaged to conduct the third party review, they must tangibly demonstrate competence to conduct the review. This includes electric industry physical security experience and either of the premier security industry certifications sponsored by ASIS International. The ASIS certification program was initiated in 1977, and those that hold the Certified Protection Professional certification are board certified in security management. Those that hold the Physical Security Professional certification are board certified in physical security.
- *An entity or organization approved by the ERO.*
- *A governmental agency with physical security expertise.*
- *An entity or organization with demonstrated law enforcement, government, or military physical security expertise.*

As with the verification under Requirement R2, Requirement R6 provides that the "review may occur concurrently with or after completion of the evaluation performed under Requirement R4 and the security plan development under Requirement R5." This provision is designed to provide applicable TOs and TOPs the flexibility to work with the third party reviewer throughout (*i.e.,* concurrent with) the evaluation performed according to Requirement R4 and the security plan(s) developed according to Requirement R5, which for some Responsible Entities may be more efficient and effective. In other

words, a TO or TOP could collaborate with their unaffiliated third party reviewer to perform an evaluation of potential threats and vulnerabilities (Requirement R4) and develop a security plan (Requirement R5) to satisfy Requirements R4 through R6 simultaneously. The intent of Requirement R6 is to have an entity other than the owner or operator of the facility to be involved in the Requirement R4 evaluation and the development of the Requirement R5 security plans and have an opportunity to provide input on the evaluation and the security plan. Accordingly, Requirement R6 is designed to allow entities the discretion to have a two-step process, where the TO performs the evaluation and develops the security plan itself and then has a third party review that assessment, or a one-step process, where the entity collaborates with a third party to perform the evaluation and develop the security plan.

Rationale for Attachment 1

The drafting team moved the applicability language from CIP-014-3 to Attachment 1 to make the standard easier to read.

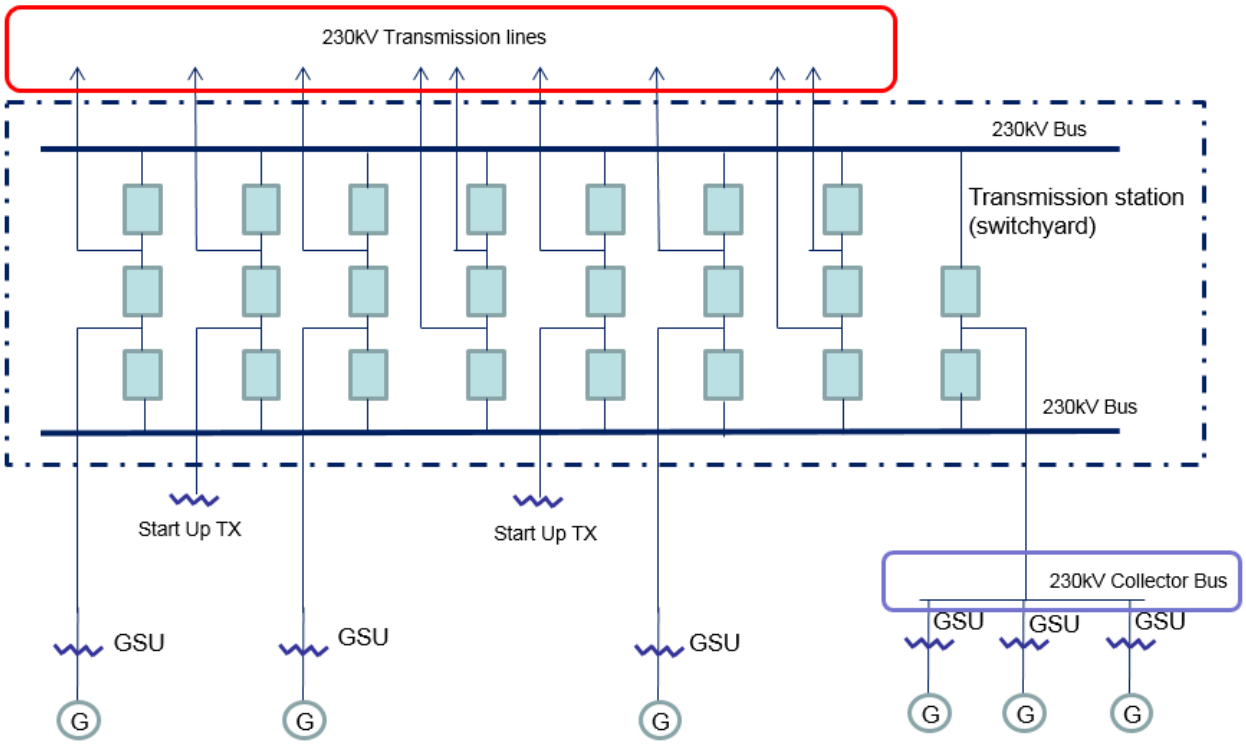
The purpose of Reliability Standard CIP-014 is to protect Transmission stations and Transmission substations, and their associated primary control centers that if rendered inoperable or damaged as a result of a physical attack could result in instability, uncontrolled separation, or Cascading within an Interconnection. To properly include those entities that own or operate such Facilities, the Reliability Standard CIP-014 first applies to TOs that own Transmission Facilities that meet the specific criteria in Applicability Section 4.1.1.1 through 4.1.1.4. The Facilities described in Applicability Section 4.1.1.1 through 4.1.1.4 mirror those Transmission Facilities that meet the bright line criteria for "Medium Impact" Transmission Facilities under Attachment 1 of Reliability Standard CIP-002-5.1a. Each TO that owns Transmission Facilities that meet the criteria in Section 4.1.1.1 through 4.1.1.4 is required to perform a risk assessment as specified in Requirement R1 to identify its Transmission stations and Transmission substations, and their associated primary control centers, that if rendered inoperable or damaged as a result of a physical attack could result in instability, uncontrolled separation, or Cascading within an Interconnection. The DT expects this population will be small and that many TOs that meet the applicability of this standard will not actually identify any such Facilities. Only those TOs with Transmission stations or Transmission substations identified in the risk assessment (and verified under Requirement R2) have performance obligations under Requirements R3 through R6.

This standard also applies to TOPs. A TOP's obligations under the standard, however, are only triggered if the TOP is notified by an applicable TO under Requirement R3 that the TOP operates a primary control center that operationally controls a Transmission station(s) or Transmission substation(s) identified in the Requirement R1 risk assessment. A primary control center operationally controls a Transmission station or Transmission substation when the control center's electronic actions can cause direct physical action at the identified Transmission station or Transmission substation, such as opening a breaker, as opposed to a control center that only has information from the Transmission station or Transmission substation and must coordinate direct action through another entity. Only TOPs who are notified that they have primary control centers under this standard have performance obligations under Requirements R4 through R6. In other words, primary control center for purposes of this Standard is the control center that the TO or TOP, respectively, uses as its primary, permanently-manned site to physically operate a Transmission station or Transmission substation that is identified in Requirement R1 and verified in Requirement R2. Control

centers that provide back-up capability are not applicable, as they are a form of resiliency and intentionally redundant.

The DT considered several options for bright line criteria that could be used to determine applicability and provide an initial threshold that defines the set of Transmission stations and Transmission substations that would meet the directives of the FERC order on physical security (*i.e.*, those that could cause instability, uncontrolled separation, or Cascading within an Interconnection). The DT determined that using the criteria for Medium Impact Transmission Facilities in Attachment 1 of CIP-002-5.1a would provide a conservative threshold for defining which Transmission stations and Transmission substations must be included in the risk assessment in Requirement R1 of CIP-014. Additionally, the DT concluded that using the CIP-002-5.1a Medium Impact criteria was appropriate because it has been approved by stakeholders, NERC, and FERC, and its use provides a technically sound basis to determine which TOs should conduct the risk assessment. As described in CIP-002-5.1a, the failure of a Transmission station or Transmission substation that meets the Medium Impact criteria could have the capability to result in exceeding one or more Interconnection Reliability Operating Limits (IROLs). The DT understands that using this bright line criteria to determine applicability may require some TOs to perform risk assessments under Requirement R1 that will result in a finding that none of their Transmission stations or Transmission substations would pose a risk of instability, uncontrolled separation, or Cascading within an Interconnection. However, the DT determined that higher bright lines could not be technically justified to ensure inclusion of all Transmission stations and Transmission substations, and their associated primary control centers that, if rendered inoperable or damaged as a result of a physical attack could result in instability, uncontrolled separation, or Cascading within an Interconnection. Further guidance and technical basis for the bright line criteria for Medium Impact Facilities can be found in the Guidelines and Technical Basis section of CIP-002-5.1a.

Additionally, the DT determined that it was not necessary to include Generator Operators and Generator Owners in the Reliability Standard. First, Transmission stations or Transmission substations interconnecting generation facilities are considered when determining applicability. TOs will consider those Transmission stations and Transmission substations that include a Transmission station on the high side of the Generator Step-up transformer using Applicability Section 4.1.1.1 and 4.1.1.2. As an example, a Transmission station or Transmission substation identified as a TO facility that interconnects generation will be subject to the Requirement R1 risk assessment if it operates at 500kV or greater or if it is connected at 200 kV – 499kV to three or more other Transmission stations or Transmission substations and has an "aggregate weighted value" exceeding 3,000 according to the table in Applicability Section 4.1.1.2. Second, the Transmission analysis or analyses conducted under Requirement R1 should take into account the impact of the loss of generation connected to applicable Transmission stations or Transmission substations. Additionally, the FERC order does not explicitly mention generation assets and is reasonably understood to focus on the most critical Transmission Facilities. The diagram below shows an example of a station.

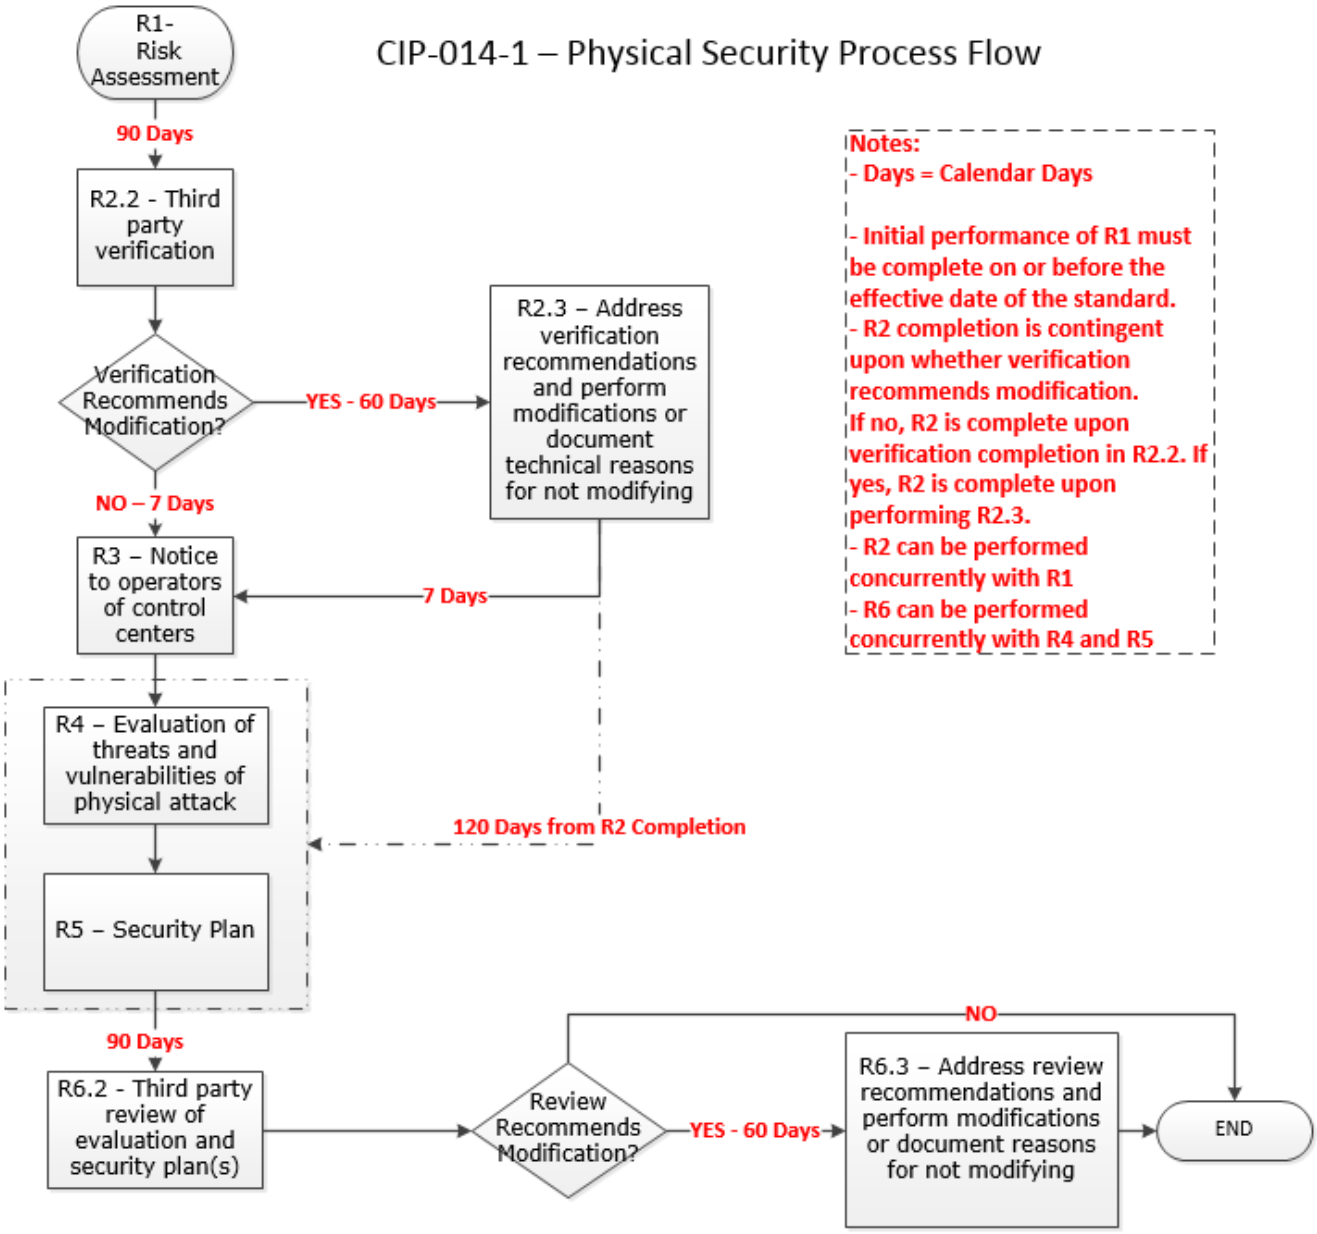


Also, the DT uses the phrase "Transmission stations or Transmission substations" to recognize the existence of both stations and substations. Many entities in industry consider a substation to be a location with physical borders (i.e., fence, wall, etc.) that contains at least an autotransformer. Locations also exist that do not contain autotransformers, and many entities in industry refer to those locations as stations (switching stations or switchyards). Therefore, the DT chose to use both "station" and "substation" to refer to the locations where groups of Transmission Facilities exist.

On the issue of joint ownership, the DT recognizes that this issue is not unique to CIP-014, and expects that the applicable TOs and TOPs will develop memorandums of understanding, agreements, Coordinated Functional Registrations, or procedures, etc., to designate responsibilities under CIP-014 when joint ownership is at issue, which is similar to what many entities have completed for other Reliability Standards.

The language contained in the applicability section regarding the collector bus is directly copied from CIP-002-5.1a, Attachment 1, and has no additional meaning within the CIP-014 standard.

Timeline



CIP-014-1 – Physical Security Process Flow
R1- Risk Assessment
90 Days
R2.2 - Third party verification
Verification Recommends Modification?
YES - 60 Days
R2.3 – Address verification recommendations and perform modifications or document technical reasons for not modifying
NO – 7 Days
R3 – Notice to operators of control centers
7 Days
R4 – Evaluation of threats and vulnerabilities of physical attack
120 Days from R2 Completion
R5 – Security Plan
90 Days
R6.2 - Third party review of evaluation and security plan(s)
Review Recommends Modification?
YES - 60 Days
NO
R6.3 – Address review recommendations and perform modifications or document reasons for not modifying
END
Notes:
- Days = Calendar Days
- Initial performance of R1 must be complete on or before the effective date of the standard.
- R2 completion is contingent upon whether verification recommends modification. If no, R2 is complete upon verification completion in R2.2. If yes, R2 is complete upon performing R2.3.
- R2 can be performed concurrently with R1
- R6 can be performed concurrently with R4 and R5

Rationale

During development of this standard, text boxes were embedded within the standard to explain the rationale for various parts of the standard. Upon Board of Trustees approval, the text from the rationale text boxes was moved to this section.

Rationale for Requirement R1 (This is for the old Requirement R1 in CIP-014-3):
This requirement meets the FERC directive from paragraph 6 of its March 7, 2014 order on physical security to perform a risk assessment to identify which facilities if rendered inoperable or damaged could impact an Interconnection through instability, uncontrolled separation, or cascading failures. The requirement is not intended to bring within the scope of the standard a Transmission station or Transmission substation unless the applicable TO determines through technical studies and analyses based on objective analysis, technical expertise, operating experience and experienced judgment that the loss of such facility would have a critical impact on the operation of the Interconnection in the event the asset is rendered inoperable or damaged. In the November 20, 2014 Order, FERC reiterated that "only an instability that has a "critical impact on the operation of the interconnection" warrants finding that the facility causing the instability is critical under Requirement R1." The TO may determine the criteria for critical impact by considering, among other criteria, any of the following:

- Criteria or methodology used by Transmission Planners or Planning Coordinators in TPL-001-4, Requirement R6
- NERC EOP-004-4 reporting criteria
- Area or magnitude of potential impact

Requirement R1 also meets the FERC directive for periodic reevaluation of the risk assessment by requiring the risk assessment to be performed every 30 months (or 60 months for an entity that has not identified in a previous risk assessment any Transmission stations or Transmission substations that if rendered inoperable or damaged could result in instability, uncontrolled separation, or Cascading within an Interconnection).

After identifying each Transmission station and Transmission substation that meets the criteria in Requirement R1, it is important to additionally identify the primary control center that operationally controls that Transmission station or Transmission substation (i.e., the control center whose electronic actions can cause direct physical actions at the identified Transmission station and Transmission substation, such as opening a breaker, compared to a control center that only has the ability to monitor the Transmission station and Transmission substation and, therefore, must coordinate direct physical action through another entity).

Rationale for Requirement R2 (This is now Requirement R6 in CIP-014-4):
This requirement meets the FERC directive from paragraph 11 in the order on physical security requiring verification by an entity other than the owner or operator of the risk assessment performed under Requirement R1.

This requirement provides the flexibility for a TO to select registered and non-registered entities with transmission planning or analysis experience to perform the verification of the Requirement R1 risk assessment. The term "unaffiliated" means that the selected verifying entity cannot be a corporate affiliate (i.e., the verifying entity cannot be an entity that controls, is controlled by, or is under common control with, the TO). The verifying entity also cannot be a division of the TO that operates as a functional unit. The term "unaffiliated" is not intended to prohibit a governmental entity from using another government entity to be a verifier under Requirement R2.

Requirement R2 also provides the TO the flexibility to work with the verifying entity throughout the Requirement R1 risk assessment, which for some TO may be more efficient and effective. In other words, a TO could coordinate with their unaffiliated verifying entity to perform a Requirement R1 risk assessment to satisfy both Requirement R1 and Requirement R2 concurrently.

Planning Coordinator is a functional entity listed in Part 2.1. The Planning Coordinator and Planning Authority are the same entity as shown in the NERC Glossary of Terms Used in NERC Reliability Standards.

Rationale for Requirement R3 (This is now Requirement R7 in CIP-014-4):
Some TOPs will have obligations under this standard for certain primary control centers. Those obligations, however, are contingent upon a TO first identifying which Transmission stations and Transmission substations meet the criteria specified by Requirement R1, as verified according to Requirement R2. This requirement is intended to ensure that a TOP that has operational control of a primary control center identified in Requirement R1, Part 1.2 of a Transmission station or Transmission substation verified according to Requirement R2 receives notice of such identification so that the TOP may timely fulfill its resulting obligations under Requirements R4 through R6. Since the timing obligations in Requirements R4 through R6 are based upon completion of Requirement R2, the TO must also include notice of the date of completion of Requirement R2. Similarly, the TO must notify the TOP of any removals from identification that result from a subsequent risk assessment under Requirement R1 or the verification process under Requirement R2.

Rationale for Requirement R4 (This is now Requirement R8 in CIP-014-4):
This requirement meets the FERC directive from paragraph 8 in the order on physical security that the reliability standard must require tailored evaluation of potential threats and vulnerabilities to facilities identified in Requirement R1 and verified according to Requirement R2. Threats and vulnerabilities may vary from facility to facility based on factors such as the facility's location, size, function, existing protections, and attractiveness of the target. As such, the requirement does not mandate a one-size-fits-all approach but requires entities to account for the unique characteristics of their facilities.

Requirement R4 does not explicitly state when the evaluation of threats and vulnerabilities must occur or be completed. However, Requirement R5 requires that the entity's security plan(s), which is dependent on the Requirement R4 evaluation, must be completed within 120 calendar days following completion of Requirement R2. Thus, an entity has the flexibility when to complete the Requirement R4 evaluation, provided that it is completed in time to comply with the requirement in Requirement R5 to develop a physical security plan 120 calendar days following completion of Requirement R2.

Rationale for Requirement R5 (This is now Requirement R9 in CIP-014-4):
This requirement meets the FERC directive from paragraph 9 in the order on physical security requiring the development and implementation of a security plan(s) designed to protect against attacks to the facilities identified in Requirement R1 based on the assessment performed under Requirement R4.

Rationale for Requirement R6 (This is now Requirement R10 in CIP-014-4):
This requirement meets the FERC directive from paragraph 11 in the order on physical security requiring review by an entity other than the owner or operator with appropriate expertise of the evaluation performed according to Requirement R4 and the security plan(s) developed according to Requirement R5.

As with the verification required by Requirement R2, Requirement R6 provides TOs and TOPs the flexibility to work with the third party reviewer throughout the Requirement R4 evaluation and the development of the Requirement R5 security plan(s). This would allow entities to satisfy their obligations under Requirement R6 concurrent with the satisfaction of their obligations under Requirements R4 and R5.

NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

Technical Rationale

Project 2023-06 CIP-014 Risk Assessment Refinement
Reliability Standard CIP-014-4 | ~~March~~ May 2026

CIP-014-4 – Physical Security

In performing the risk assessment, the Transmission Owner (TO) should first identify their population of Transmission stations and Transmission substations that meet the criteria contained in Attachment 1. The Standard requires the TO to perform a risk assessment, consisting of transmission analyses to determine which of those Transmission stations and Transmission substations, if rendered inoperable or damaged, could result in instability, uncontrolled separation, or Cascading within an Interconnection.

The purpose of Reliability Standard CIP-014 is to protect Transmission stations and Transmission substations, and their associated primary control centers, that if rendered inoperable or damaged, due to a physical attack, could cause instability, uncontrolled separation, or Cascading within an Interconnection. To properly identify candidates for such Transmission station(s) and Transmission substation(s), the TO shall evaluate the criteria listed in Attachment 1.

Rationale for Requirement R1

The Standard Authorization Request (SAR) directed the drafting team (DT) to clarify the in-service window. It also directed the DT to correct any discrepancies between the study period, frequency of study, and the base case(s) a TO uses. In the previous version of CIP-014, the 30-month time frame and the 24-month planned-to-be-in-service date could, if not carefully applied, lead to gaps between models and study horizons. Per the SAR, CIP-014-4 has consolidated these multiple timelines into one.

Requirement R1 is revised to ensure that each TO establishes a list of applicable Transmission station(s) or Transmission substation(s) in accordance with Attachment 1. Aligning the 36 calendar months look ahead in Requirement R1 with the 36 calendar months risk assessment cycle ensures that system topology of the cases used to assess applicability is consistent with the system topology in the risk assessment models.

TOs shall review and, if necessary, update the list of applicable Transmission station(s) or Transmission substation(s) per Attachment 1 at least once every 36 calendar months. The list of applicable Transmission station(s) or Transmission substation(s) shall include existing Facilities and Transmission station(s) and Transmission substation(s) planned to be in service within 36 calendar months. The 36 calendar months risk assessment study cycle aligns with the 36 calendar months planned-to-be-in-service date. "Planned to be in-service" should be taken to mean all Transmission station(s) and Transmission substation(s) as modeled in the base cases ~~for the Near-Term Transmission Planning Horizon~~.

Rationale for Requirement R2

The distance chosen in ~~r~~Requirement R2 is based on guidelines that considered a variety of plausible attack scenarios capable of rendering a substation inoperable.

The DT chose 1,500 feet or 457 meters (the shortest distance, measured substation fence line to substation fence line) in Requirement R2 after review of the Department of Homeland Security (DHS)-Department of Justice (DOJ) Bomb Threat Stand-Off Card. The Bomb Threat Stand-Off Card is a quick reference guide providing recommended evacuation and shelter-in-place distances for various types and sizes of Improvised Explosive Devices (IED), based on version of August~~,~~ 2025.[1]

The guidance above allowed the DT to draft language that clarified what study scenario(s) and other study assumptions are appropriate and reasonable considering the intent of CIP-014 and the potential range of issues during a physical attack. Simulations should incorporate the loss of station elements without the reliance on local system protection. Clarifying how to account for adjacent Transmission stations or Transmission substations of differing ownership as well as for those Transmission stations or Transmission substations within line-of-sight to each other. These provide limits to what the TO must study and avoid including an explicit representation of the physical event in the standard.

Accurate simulation of the event was deemed a priority of the DT. The DT felt that ownership of proximate substations, as identified in Requirement R2, was irrelevant to Bulk Electric System impact.

The Transmission station(s) or Transmission substation(s) identified in Requirement R2 are only intended for use in the Requirement R5 risk assessment and the Requirement R6 third-party verification to properly account for additional equipment that, if also damaged during an event, could lead to loss of additional Facilities. They are not intended to be subject to Requirements R7 through R10. Requirements R7 through R10 are only relevant for the Transmission ~~sub~~station(s) or Transmission substation(s) identified in Requirement R1.

Rationale for Requirement R3
The new Requirement R3 fulfills the first item in the SAR to "clarify the risk assessment methods" and that the "methods should account for dynamic studies." Requirement R3 also fulfills other items in the SAR around case selection, technically supported rationales, the loss of communications, and local protection within the affected station. The previous Requirement R3 is now Requirement R7 of CIP-014-4.

Per Requirement R3, each TO is required to have a risk assessment methodology, including the criteria by which analytical results will be examined to identify Transmission station(s) or Transmission substation(s) that if rendered inoperable or damaged as a result of a physical attack could result in instability, uncontrolled separation, or Cascading within an Interconnection. The TO is not required to develop its own methodology and is free to use a methodology developed elsewhere, such as in coordination with neighboring TOs or Independent System Operators (ISOs).

Rationale for Requirement R3, Part 3.1
TOs should determine the amount of unacceptable load loss and generation loss within an Interconnection when determining the impact of an event to the Transmission system. The thresholds

[1] https://www.cisa.gov/resources-tools/resources/dhs-doj-bomb-threat-stand-card

identifying unacceptable generation and load losses should be the total of the losses within the TO's footprint and losses external to the TO's footprint. Criteria for measures such as load loss or generation loss should consider the impact to the Interconnection.

While the use of Recommended Interconnection Resource Loss Protection Criteria (RLPC) provides one approach to generation loss—setting these thresholds based on the two largest potential resource losses in an Interconnection as detailed in Attachment A of NERC Reliability Standard BAL-003-2—other methods may also be appropriate, as determined by the TO. The RLPC values should be taken from the latest approved version of NERC's annual 'Frequency Response Annual Analysis' report.

Use of the RLPC recommendations in accordance with the latest version of NERC's 'Frequency Response Annual Analysis' report is an example of technically justified thresholds for unacceptable generation and load loss within an Interconnection. Use of lower values than the RLPC recommendations is also technically justifiable. Use of higher values than the RLPC recommendations would require additional technical justification.

Large loss of generation or load due to the evaluated disturbance could result in severe System impacts. The documented risk assessment methodology shall include the amount of unacceptable load loss and generation loss, that could result in instability, uncontrolled separation, or Cascading within an Interconnection. Conditions and thresholds used for determining critical Transmission station(s) or Transmission substation(s), i.e., those that if rendered inoperable or damaged as a result of a physical attack could result in instability, uncontrolled separation, or Cascading within an Interconnection, should be part of the documented risk assessment methodology.

It is up to the TO to identify post-event measures that can be used to assess the criticality of a Transmission station or Transmission substation. Suggested measures are listed below. A TO can decide that one or more of the items are not applicable to their location within the interconnection and if any additional items should be included.

The following parameters can be used to evaluate the steady-state and/or dynamic analysis:

- Steady state voltages
- Transient voltage response
- Thermal loading of Facilities
- Relay loadability
- Rotor angle stability
- Frequency exceeding generator limits
- Frequency stability
- Acceptable damping of oscillations
- Cascading line tripping

- Steady-state voltage stability

Rationale for Requirement R3, Part 3.2
The performance of both steady state and dynamics simulations is required for all applicable Transmission station(s) and substation(s). Dynamic simulations are required by the standard because exclusively performing steady-state simulations is insufficient for determining whether the loss of a Transmission station or Transmission substation could result in instability, uncontrolled separation, or Cascading within an Interconnection.

Rationale for Requirement R3, Part 3.3
Historically, simulation of a three-phase Fault at applicable Transmission station(s) and Transmission substation(s) appears to be the prevalent assumption used by the majority of TOs in the performance of stability analyses for CIP-014 risk assessments. The DT has determined, however, that there may be specific locations or scenarios that merit the use of a different Fault type (or a sequence or progression of multiple Faults) more consistent with the occurrence of a physical attack for those locations or scenarios.

Rationale for Requirement R3, Part 3.3.1
The applicable Transmission substation or Transmission station is the station that is assumed to be under attack for the purposes of this standard. Any damage to Transmission sStations or Transmission sSubstations in proximity is assumed to be collateral damage. The intent of CIP-014 is to cover the case when the applicable Transmission sStation or Transmission sSubstation becomes inoperable. The SAR refers to the "total loss of communication and protection equipment at the substation." Requirement R3, Part 3.3.1 uses the "prior loss" wording to eliminate difficulties when performing simulations. When exploring possible attack scenarios, it is possible to develop scenarios that allow a fault prior to the loss of communication and protection systems. Protection systems typically operate within a few cycles, so a short delay between the fault and the loss of the protection system could allow breakers to operate. "Prior loss of communication and Protection Systems" eliminates this possibility, so the fault should be studied without the availability of local communications or Protection Systems. The use of delayed clearing times, typically Zone 2, is necessary because the applicable substation has lost local protection and all communications with other substations.

Rationale for Requirement R3, Part 3.3.2
The relative locations of the applicable Transmission SStation or Transmission sSubstation and the neighboring substation will determine the best way to evaluate and study the combinations of substations. Every substation identified in Requirement R2 must be studied in at least one combination with its applicable Transmission sStation or Transmission sSubstation. For example, if there is a single neighboring substation near the applicable substation, then the applicable and neighboring substation should be studied together. If there are two or more neighboring substations that are close together and both within 1,500 feet of the applicable substation, then the responsible entity may study the applicable substation with the combination of the two neighbors. If there are two or more neighboring substations on different sides of the applicable substation, then it can make more sense to study the applicable substation with each proximity substation individually. For purposes of the simulations, the faults should be applied at the same time or after the faults applied to the applicable Transmission sStation or

Transmission sSubstation depending on the simulated event and any restrictions of the simulation software. Not all software packages allow for multiple simultaneous faults. The protection and communication systems at the proximate substations are expected to operate normally, so delayed clearing is not necessary.

Rationale for Requirement R3, Part 3.3.3
The DT believes that requiring documented justification for Faults being selected, without specifying Fault type, allows TOs to determine on a location-by-location basis what is a credible high-severity scenario for a physical attack and furthermore how to appropriately model the associated stability simulations. The DT also believes that a single justification may be used for multiple locations. Requirement 3 Part 3.3.3 allows the TOs to determine the type of fault with documented justification. If a fault type and justification is relevant to multiple Transmission sStations or Transmission sSubstations, there is no need to repeatedly document the same justification.

Rationale for Requirement R3, Part 3.3.4
Each simulation should include the removal of all Elements that Protection Systems and other controls are expected to automatically disconnect for the event. After the prior loss of communication and Protection Systems at the applicable Transmission station or Transmission substation, other Protection Systems should operate as expected for the event considered. The accurate simulation of Protection System actions is essential for correctly identifying the risk of instability, uncontrolled separation, or Cascading within an Interconnection.

Rationale for Requirement R3, Part 3.3.5
While there are commonly used generic clearing times for remote clearing that are consistent across the industry, actual clearing times can be shorter or longer depending on conditions and design considerations at an individual TO. The difference of a few cycles can have a significant impact on the transient behavior of generating units, therefore, it is required that the risk analysis use actual or more conservative clearing times.

Rationale for Requirement R4
Joint ownership of Transmission substations and Transmission stations was discussed in the Guidelines and Technical Basis of previous versions of the CIP-014-3 standard, but because ownership was not addressed in the standard language, the CIP-014-4 Risk Assessment Refinement SAR required clarification which resulted in the new requirement R4. TOs that have applicable jointly owned Transmission substations and Transmission stations should coordinate and document their individual and joint responsibilities for CIP-014-4 Requirements R3 and R5. TOs should be able to demonstrate sole or joint ownership through one-line diagrams with ownership demarcations and/or a letter of attestation stating which stations are solely or jointly owned.

Rationale for Requirement R5
An objective of the CIP-014-3 Risk Assessment Refinement SAR was to align study periods, frequency of studies, and the powerflow models used for the studies. A 36-month periodicity was chosen for the Requirement R5 risk assessment to reduce the periodicity options from previous versions of the standard.

Additionally, a single study periodicity is more easily aligned with project in-service date considerations and model choices. As called for in Project Scope item 3 of the CIP-014-3 Risk Assessment Refinement SAR, the risk assessment must comply with the methodology developed in Requirement R3, so this language was explicitly added to Requirement R5.

TOs shall review and, if necessary, update the list of applicable Transmission station(s) or Transmission substation(s) per Attachment 1 at least once every 36 months. The list of applicable Transmission station(s) and Transmission substation(s) shall include existing or planned to be in service within 36 months Transmission station(s) and Transmission substation(s). The 36-month cycle for updating the list of applicable Transmission station(s) or Transmission substation(s) per Attachment 1 aligns with the annual cycle for performing Planning Assessments per NERC Standard TPL-001. The 36-month risk assessment study cycle aligns with the 36-month planned-to-be-in-service date.

In addition to the performance of the risk assessment using Transmission station(s) and Transmission substation(s) identified in Requirement R1, any proximate Transmission station(s) and Transmission substation(s) identified in Requirement R2 should also be included in the risk assessment. Furthermore, any Transmission station(s) and Transmission substation(s) assessed due to having been identified per Requirement R1 should also be run as part of a proximate Transmission station(s) and Transmission substation(s) group per Requirement R2 if such an identification is made.

Rationale for Requirement R5, Part 5.1
If a TO performs a steady state analysis and identifies a Transmission station or substation that, if rendered inoperable or damaged, could result in instability, uncontrolled separation, or Cascading within an Interconnection, then dynamic analysis is not required for that Transmission station or substation. If a TO performs a dynamic analysis and identifies a Transmission station or substation that, if rendered inoperable or damaged, could result in instability, uncontrolled separation, or Cascading within an Interconnection, then steady state analysis is not required for that Transmission station or substation.

Rationale for Requirement R5, Part 5.2
The intent of this Requirement is that TOs do not have to reassess already identified and protected Transmission stations or substations (Requirement R5 Part 5.3 and Requirements R7 through R10 still apply to those Transmission stations or substations). A new risk assessment will need to be performed if the TO wishes to determine whether or not a Transmission station or substation can be removed from identification and protection as outlined in Requirement R7 Part 7.1.

Rationale for Requirement R5, Part 5.3
Identification of Primary Control Centers: After completing the risk assessment under Requirement R5 and verified under Requirement R6, it is important to additionally identify the primary control center that operationally controls each Transmission station or Transmission substation, that if rendered inoperable or damaged could result in instability, uncontrolled separation, or Cascading within an Interconnection. A primary control center “operationally controls” a Transmission station or Transmission substation when the control center’s electronic actions can cause direct physical actions at the identified Transmission station and Transmission substation, such as opening a breaker.

Rationale for Implementation Plan

In developing the Implementation Plan, the DT has determined that 24 calendar months for the CIP-014-4 implementation plan would allow adequate time for TOs and Transmission Operators (TOPs) to determine applicability, develop criteria, write or revise methodologies, perform assessments, and procure unaffiliated third parties for risk assessment verification (which some TOs have performed concurrently with their risk assessment analyses.

Furthermore, given a) FERC's sense of urgency stated in their December 2022 order,[2] which directed NERC to evaluate the effectiveness of CIP-014-3 in mitigating the risks to the bulk power system associated with physical attacks~~original Order to revise CIP-014 (Docket No. RD23-2-000, issued December 15, 2022)~~, b) the findings of NERC's report to FERC on April 14, 2023 (Evaluation of the Physical Security Reliability Standard and Physical Security Attacks to the Bulk-Power System)[3], and c) the designation of Project 2023-06 as High Priority, the DT has determined that an Implementation Plan schedule of greater than 24 calendar months would not be responsive to the risks identified~~FERC's concerns~~ with sufficient urgency, and thus 24 calendar months is an appropriate timeframe. While the DT understands the time and resources required of entities to respond to this Implementation Plan, the DT believes that 24 calendar months properly balances the need to address the reliability risk and the time needed by entities to determine applicability, develop criteria, write or revise methodologies, perform assessments, and procure unaffiliated third parties for risk assessment verification.

CIP-014-4 Flowchart

The flowchart is a concise outline that guides through the steps for completing the risk assessment at least once every 36 calendar months, based on the Applicability in Attachment 1 and Requirements R1-R5.

Section B. Requirement R2
Risk Assessment Methodology
Technical justification of the method to assess instability, uncontrolled separation, or Cascading within an Interconnection 3.1
Provision that steady state and dynamic simulations to be performed on one System peak and one System Off-Peak case 3.2
Specification for Fault simulations at applicable station and, if applicable, associated proximate existing BES station(s) 3.3
Section B. Requirement R3
Multiple owned stations
TOs to document each individuals and joint responsibilities in risk assessment methodology (R3) and for performing any required assessments per R5
Section B. Requirement R4
Footnote: The term Station is, when used in this flowchart, equivalent with the terms Transmission station or Transmission substation in NERC Reliability Standard CIP-014-4 'Physical Security.'
Risk Assessment
At least once every 36 calendar months using methodology established in R3 and including any Stations identified in R1
Current Risk Assessment
If a Station is identified in steady state or dynamic simulation as causing instability, uncontrolled separation, or Cascading within an Interconnection when rendered inoperable or damaged requires no further simulation. 5.1
Previous Risk Assessment
If a previous assessment has identified a Station as causing instability, uncontrolled separation, or Cascading within an Interconnection when rendered inoperable or damaged, then the Transmission Owner may forgo additional assessments on that Station. 5.2
Primary Control Center
Identify the primary control center that operationally controls each Station identified as causing instability, uncontrolled separation, or Cascading within an Interconnection when rendered inoperable or damaged. 5.3
Section B. Requirement R5
Verify Risk Assessment
Have an unaffiliated third party verify the risk assessment performed under Requirement R5
Section B. Requirement R6
Footnote: The term Station is, when used in this flowchart, equivalent with the terms Transmission station or Transmission substation in NERC Reliability Standard CIP-014-4 'Physical Security.'

Technical Rationale for Reliability Standard CIP-014-3

This section contains a "cut and paste" of the former Guidelines and Technical Basis (GTB) as-is of from CIP-014-3 standard to preserve any historical references. No modifications have been made.

Requirement R2 (This is Requirement R6 in CIP-014-4)
This requirement specifies verification of the risk assessment performed under Requirement R1 by an entity other than the owner or operator of the Requirement R1 risk assessment.

A verification of the risk assessment by an unaffiliated third party, as specified in Requirement R2, could consist of:

1. Certifying that the Requirement R1 risk assessment considers the Transmission stations and Transmission substations identified in Applicability Section 4.1.1.
2. Review of the model used to conduct the risk assessment to ensure it contains sufficient system topology to identify Transmission stations and Transmission substations that if rendered inoperable or damaged could cause instability, uncontrolled separation, or Cascading within an Interconnection.
3. Review of the Requirement R1 risk assessment methodology.

This requirement provides the flexibility for a TO to select from unaffiliated registered and non-registered entities with transmission planning or analysis experience to perform the verification of the Requirement R1 risk assessment. The term unaffiliated means that the selected verifying entity cannot be a corporate affiliate (i.e., the verifying or third party reviewer cannot be an entity that corporately controls, is controlled by, or is under common control with the TO). The verifying entity also cannot be a division of the TO that operates as a functional unit.

The prohibition on registered entities using a corporate affiliate to conduct the verification, however, does not prohibit a governmental entity (e.g., a city, a municipality, a U.S. federal power marketing agency, or any other political subdivision of U.S. or Canadian federal, state, or provincial governments) from selecting as the verifying entity another governmental entity within the same political subdivision. For instance, a U.S. federal power marketing agency may select as its verifier another U.S. federal agency to conduct its verification so long as the selected entity has transmission planning or analysis experience. Similarly, a TO owned by a Canadian province can use a separate agency of that province to perform the verification. The verifying entity, however, must still be a third party and cannot be a division of the registered entity that operates as a functional unit.

Requirement R2 also provides that the "verification may occur concurrent with or after the risk assessment performed under Requirement R1." This provision is designed to provide the TO the flexibility to work with the verifying entity throughout (i.e., concurrent with) the risk assessment, which for some TOs may be more efficient and effective. In other words, a TO could collaborate with their unaffiliated verifying entity to perform the risk assessment under Requirement R1 such that both Requirement R1 and

Requirement R2 are satisfied concurrently. The intent of Requirement R2 is to have an entity other than the owner or operator of the facility to be involved in the risk assessment process and have an opportunity to provide input. Accordingly, Requirement R2 is designed to allow entities the discretion to have a two-step process, where the TO performs the risk assessment and subsequently has a third party review that assessment, or a one-step process, where the entity collaborates with a third party to perform the risk assessment.

Characteristics to consider in selecting a third party reviewer could include:

- Registered Entity with applicable planning and reliability functions.
- Experience in power system studies and planning.
- The entity's understanding of the MOD standards, TPL standards, and facility ratings as they pertain to planning studies.
- The entity's familiarity with the Interconnection within which the TO is located.

With respect to the requirement that TO develop and implement procedures for protecting confidential and sensitive information, the TO could have a method for identifying documents that require confidential treatment. One mechanism for protecting confidential or sensitive information is to prohibit removal of sensitive or confidential information from the TO's site. TOs could include such a prohibition in a non-disclosure agreement with the verifying entity.

A Technical feasibility study is not required in the Requirement R2 documentation of the technical basis for not modifying the identification in accordance with the recommendation.

On the issue of the difference between a verifier in Requirement R2 and a reviewer in Requirement R6, the DT indicates that the verifier will confirm that the risk assessment was completed in accordance with Requirement R1, including the number of Transmission stations and substations identified, while the reviewer in Requirement R6 is providing expertise on the manner in which the evaluation of threats was conducted in accordance with Requirement R4, and the physical security plan in accordance with Requirement R5. In the latter situation there is no verification of a technical analysis, rather an application of experience and expertise to provide guidance or recommendations, if needed.

Parts 2.4 and 6.4 require the entities to have procedures to protect the confidentiality of sensitive or confidential information. Those procedures may include the following elements:

1. Control and retention of information on site for third party verifiers/reviewers.
2. Only "need to know" employees, etc., get the information.
3. Marking documents as confidential
4. Securely storing and destroying information when no longer needed.
5. Not releasing information outside the entity without, for example, General Counsel sign-off.

Requirement R3 (This is now Requirement R7 in CIP-014-4)
Some TOPs will have obligations under this standard for certain primary control centers. Those obligations, however, are contingent upon a Transmission Owner(TO) first completing the risk assessment specified by Requirement R1 and the verification specified by Requirement R2. Requirement R3 is intended to ensure that a TOP that has operational control of a primary control center identified in Requirement R1 receive notice so that the TOP may fulfill the rest of the obligations required in Requirements R4 through R6. Since the timing obligations in Requirements R4 through R6 are based upon completion of Requirement R2, the TO must also include within the notice the date of completion of Requirement R2. Similarly, the TO must notify the TOP of any removals from identification that result from a subsequent risk assessment under Requirement R1 or as a result of the verification process under Requirement R2.

Requirement R4 (This is now Requirement R8 in CIP-014-4)
This requirement requires owners and operators of facilities identified by the Requirement R1 risk assessment and that are verified under Requirement R2 to conduct an assessment of potential threats and vulnerabilities to those Transmission stations, Transmission substations, and primary control centers using a tailored evaluation process. Threats and vulnerabilities may vary from facility to facility based on any number of factors that include, but are not limited to, location, size, function, existing physical security protections, and attractiveness as a target.

In order to effectively conduct a threat and vulnerability assessment, the asset owner may be the best source to determine specific site vulnerabilities, but current and evolving threats may best be determined by others in the intelligence or law enforcement communities. A number of resources have been identified in the standard, but many others exist and asset owners are not limited to where they may turn for assistance. Additional resources may include state or local fusion centers, U.S. Department of Homeland Security, Federal Bureau of Investigations (FBI), Public Safety Canada, Royal Canadian Mounted Police, and InfraGard chapters coordinated by the FBI.

The Responsible Entity is required to take a number of factors into account in Parts 4.1 to 4.3 in order to make a risk-based evaluation under Requirement R4.

To assist in determining the current threat for a facility, the prior history of attacks on similarly protected facilities should be considered when assessing probability and likelihood of occurrence at the facility in question.

Resources that may be useful in conducting threat and vulnerability assessments include:

- NERC Security Guideline for the Electricity Sector: Physical Security.
- NERC Security Guideline: Physical Security Response.
- ASIS International General Risk Assessment Guidelines.
- ASIS International Facilities Physical Security Measure Guideline.
- ASIS International Security Management Standard: Physical Asset Protection.

- Whole Building Design Guide - Threat/Vulnerability Assessments.

Requirement R5 (This is now Requirement R9 in CIP-014-4)
This requirement specifies development and implementation of a security plan(s) designed to protect against attacks to the facilities identified in Requirement R1 based on the assessment performed under Requirement R4.

Requirement R5 specifies the following attributes for the physical security plan:

- *Resiliency or security measures designed collectively to deter, detect, delay, assess, communicate, and respond to potential physical threats and vulnerabilities identified during the evaluation conducted in Requirement R4.*

  Resiliency may include, among other things:

  a. System topology changes,

  b. Spare equipment,

  c. Construction of a new Transmission station or Transmission substation.

  While most security measures will work together to collectively harden the entire site, some may be allocated to protect specific critical components. For example, if protection from gunfire is considered necessary, the entity may only install ballistic protection for critical components, not the entire site.

- *Law enforcement contact and coordination information.*

  Examples of such information may be posting 9-1-1 for emergency calls and providing substation safety and familiarization training for local and federal law enforcement, fire department, and Emergency Medical Services.

- *A timeline for executing the physical security enhancements and modifications specified in the physical security plan.*

  Entities have the flexibility to prioritize the implementation of the various resiliency or security enhancements and modifications in their security plan according to risk, resources, or other factors. The requirement to include a timeline in the physical security plan for executing the actual physical security enhancements and modifications does not also require that the enhancements and modifications be completed within 120 days. The actual timeline may extend beyond the 120 days, depending on the amount of work to be completed.

- *Provisions to evaluate evolving physical threats, and their corresponding security measures, to the Transmission station(s), Transmission substation(s), or primary control center(s).*

  A registered entity's physical security plan should include processes and responsibilities for obtaining and handling alerts, intelligence, and threat warnings from various sources. Some of these sources could include the ERO, E-ISAC, and US and/or Canadian federal agencies. This information should be used to reevaluate or consider changes in the security plan and corresponding security measures of the security plan found in R5.

Incremental changes made to the physical security plan prior to the next required third party review do not require additional third party reviews.

Requirement R6 (This is now Requirement R10 in CIP-014-4)
This requirement specifies review by an entity other than the TO or TOP with appropriate expertise for the evaluation performed according to Requirement R4 and the security plan(s) developed according to Requirement R5. As with Requirement R2, the term unaffiliated means that the selected third party reviewer cannot be a corporate affiliate (*i.e.,* the third party reviewer cannot be an entity that corporately controls, is controlled by or is under common control with, the TOP). A third party reviewer also cannot be a division of the TOP that operates as a functional unit.

As noted in the guidance for Requirement R2, the prohibition on registered entities using a corporate affiliate to conduct the review, however, does not prohibit a governmental entity from selecting as the third party reviewer another governmental entity within the same political subdivision. For instance, a city or municipality may use its local enforcement agency, so long as the local law enforcement agency satisfies the criteria in Requirement R6. The third party reviewer, however, must still be a third party and cannot be a division of the registered entity that operates as a functional unit.

The Responsible Entity can select from several possible entities to perform the review:

- *An entity or organization with electric industry physical security experience and whose review staff has at least one member who holds either a Certified Protection Professional or Physical Security Professional certification.*

  In selecting Certified Protection Professional and Physical Security Professional for use in this standard, the DT believed it was important that if a private entity such as a consulting or security firm was engaged to conduct the third party review, they must tangibly demonstrate competence to conduct the review. This includes electric industry physical security experience and either of the premier security industry certifications sponsored by ASIS International. The ASIS certification program was initiated in 1977, and those that hold the Certified Protection Professional certification are board certified in security management. Those that hold the Physical Security Professional certification are board certified in physical security.
- *An entity or organization approved by the ERO.*
- *A governmental agency with physical security expertise.*
- *An entity or organization with demonstrated law enforcement, government, or military physical security expertise.*

As with the verification under Requirement R2, Requirement R6 provides that the "review may occur concurrently with or after completion of the evaluation performed under Requirement R4 and the security plan development under Requirement R5." This provision is designed to provide applicable TOs and TOPs the flexibility to work with the third party reviewer throughout (*i.e.,* concurrent with) the evaluation performed according to Requirement R4 and the security plan(s) developed according to Requirement R5, which for some Responsible Entities may be more efficient and effective. In other

words, a TO or TOP could collaborate with their unaffiliated third party reviewer to perform an evaluation of potential threats and vulnerabilities (Requirement R4) and develop a security plan (Requirement R5) to satisfy Requirements R4 through R6 simultaneously. The intent of Requirement R6 is to have an entity other than the owner or operator of the facility to be involved in the Requirement R4 evaluation and the development of the Requirement R5 security plans and have an opportunity to provide input on the evaluation and the security plan. Accordingly, Requirement R6 is designed to allow entities the discretion to have a two-step process, where the TO performs the evaluation and develops the security plan itself and then has a third party review that assessment, or a one-step process, where the entity collaborates with a third party to perform the evaluation and develop the security plan.

Rationale for Attachment 1

The drafting team moved the applicability language from CIP-014-3 to Attachment 1 to make the standard easier to read.

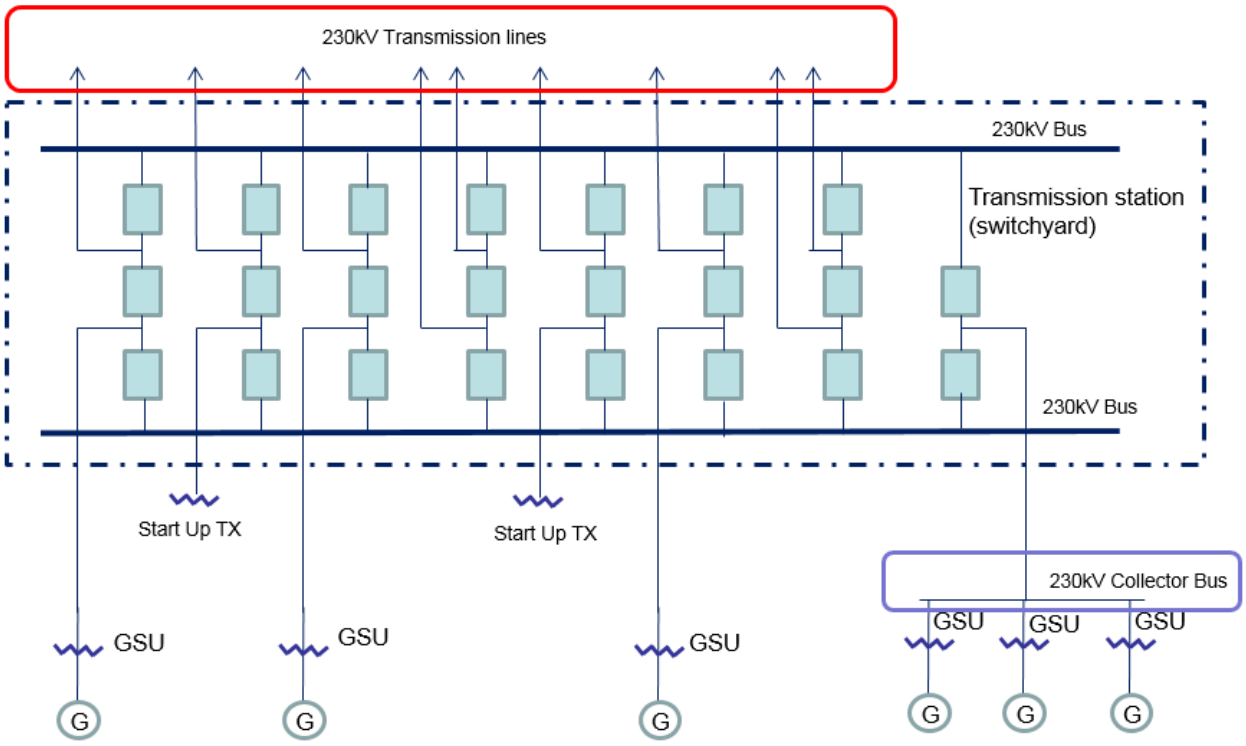
The purpose of Reliability Standard CIP-014 is to protect Transmission stations and Transmission substations, and their associated primary control centers that if rendered inoperable or damaged as a result of a physical attack could result in instability, uncontrolled separation, or Cascading within an Interconnection. To properly include those entities that own or operate such Facilities, the Reliability Standard CIP-014 first applies to TOs that own Transmission Facilities that meet the specific criteria in Applicability Section 4.1.1.1 through 4.1.1.4. The Facilities described in Applicability Section 4.1.1.1 through 4.1.1.4 mirror those Transmission Facilities that meet the bright line criteria for "Medium Impact" Transmission Facilities under Attachment 1 of Reliability Standard CIP-002-5.1a. Each TO that owns Transmission Facilities that meet the criteria in Section 4.1.1.1 through 4.1.1.4 is required to perform a risk assessment as specified in Requirement R1 to identify its Transmission stations and Transmission substations, and their associated primary control centers, that if rendered inoperable or damaged as a result of a physical attack could result in instability, uncontrolled separation, or Cascading within an Interconnection. The DT expects this population will be small and that many TOs that meet the applicability of this standard will not actually identify any such Facilities. Only those TOs with Transmission stations or Transmission substations identified in the risk assessment (and verified under Requirement R2) have performance obligations under Requirements R3 through R6.

This standard also applies to TOPs. A TOP's obligations under the standard, however, are only triggered if the TOP is notified by an applicable TO under Requirement R3 that the TOP operates a primary control center that operationally controls a Transmission station(s) or Transmission substation(s) identified in the Requirement R1 risk assessment. A primary control center operationally controls a Transmission station or Transmission substation when the control center's electronic actions can cause direct physical action at the identified Transmission station or Transmission substation, such as opening a breaker, as opposed to a control center that only has information from the Transmission station or Transmission substation and must coordinate direct action through another entity. Only TOPs who are notified that they have primary control centers under this standard have performance obligations under Requirements R4 through R6. In other words, primary control center for purposes of this Standard is the control center that the TO or TOP, respectively, uses as its primary, permanently-manned site to physically operate a Transmission station or Transmission substation that is identified in Requirement R1 and verified in Requirement R2. Control

centers that provide back-up capability are not applicable, as they are a form of resiliency and intentionally redundant.

The DT considered several options for bright line criteria that could be used to determine applicability and provide an initial threshold that defines the set of Transmission stations and Transmission substations that would meet the directives of the FERC order on physical security (*i.e.*, those that could cause instability, uncontrolled separation, or Cascading within an Interconnection). The DT determined that using the criteria for Medium Impact Transmission Facilities in Attachment 1 of CIP-002-5.1a would provide a conservative threshold for defining which Transmission stations and Transmission substations must be included in the risk assessment in Requirement R1 of CIP-014. Additionally, the DT concluded that using the CIP-002-5.1a Medium Impact criteria was appropriate because it has been approved by stakeholders, NERC, and FERC, and its use provides a technically sound basis to determine which TOs should conduct the risk assessment. As described in CIP-002-5.1a, the failure of a Transmission station or Transmission substation that meets the Medium Impact criteria could have the capability to result in exceeding one or more Interconnection Reliability Operating Limits (IROLs). The DT understands that using this bright line criteria to determine applicability may require some TOs to perform risk assessments under Requirement R1 that will result in a finding that none of their Transmission stations or Transmission substations would pose a risk of instability, uncontrolled separation, or Cascading within an Interconnection. However, the DT determined that higher bright lines could not be technically justified to ensure inclusion of all Transmission stations and Transmission substations, and their associated primary control centers that, if rendered inoperable or damaged as a result of a physical attack could result in instability, uncontrolled separation, or Cascading within an Interconnection. Further guidance and technical basis for the bright line criteria for Medium Impact Facilities can be found in the Guidelines and Technical Basis section of CIP-002-5.1a.

Additionally, the DT determined that it was not necessary to include Generator Operators and Generator Owners in the Reliability Standard. First, Transmission stations or Transmission substations interconnecting generation facilities are considered when determining applicability. TOs will consider those Transmission stations and Transmission substations that include a Transmission station on the high side of the Generator Step-up transformer using Applicability Section 4.1.1.1 and 4.1.1.2. As an example, a Transmission station or Transmission substation identified as a TO facility that interconnects generation will be subject to the Requirement R1 risk assessment if it operates at 500kV or greater or if it is connected at 200 kV – 499kV to three or more other Transmission stations or Transmission substations and has an "aggregate weighted value" exceeding 3,000 according to the table in Applicability Section 4.1.1.2. Second, the Transmission analysis or analyses conducted under Requirement R1 should take into account the impact of the loss of generation connected to applicable Transmission stations or Transmission substations. Additionally, the FERC order does not explicitly mention generation assets and is reasonably understood to focus on the most critical Transmission Facilities. The diagram below shows an example of a station.

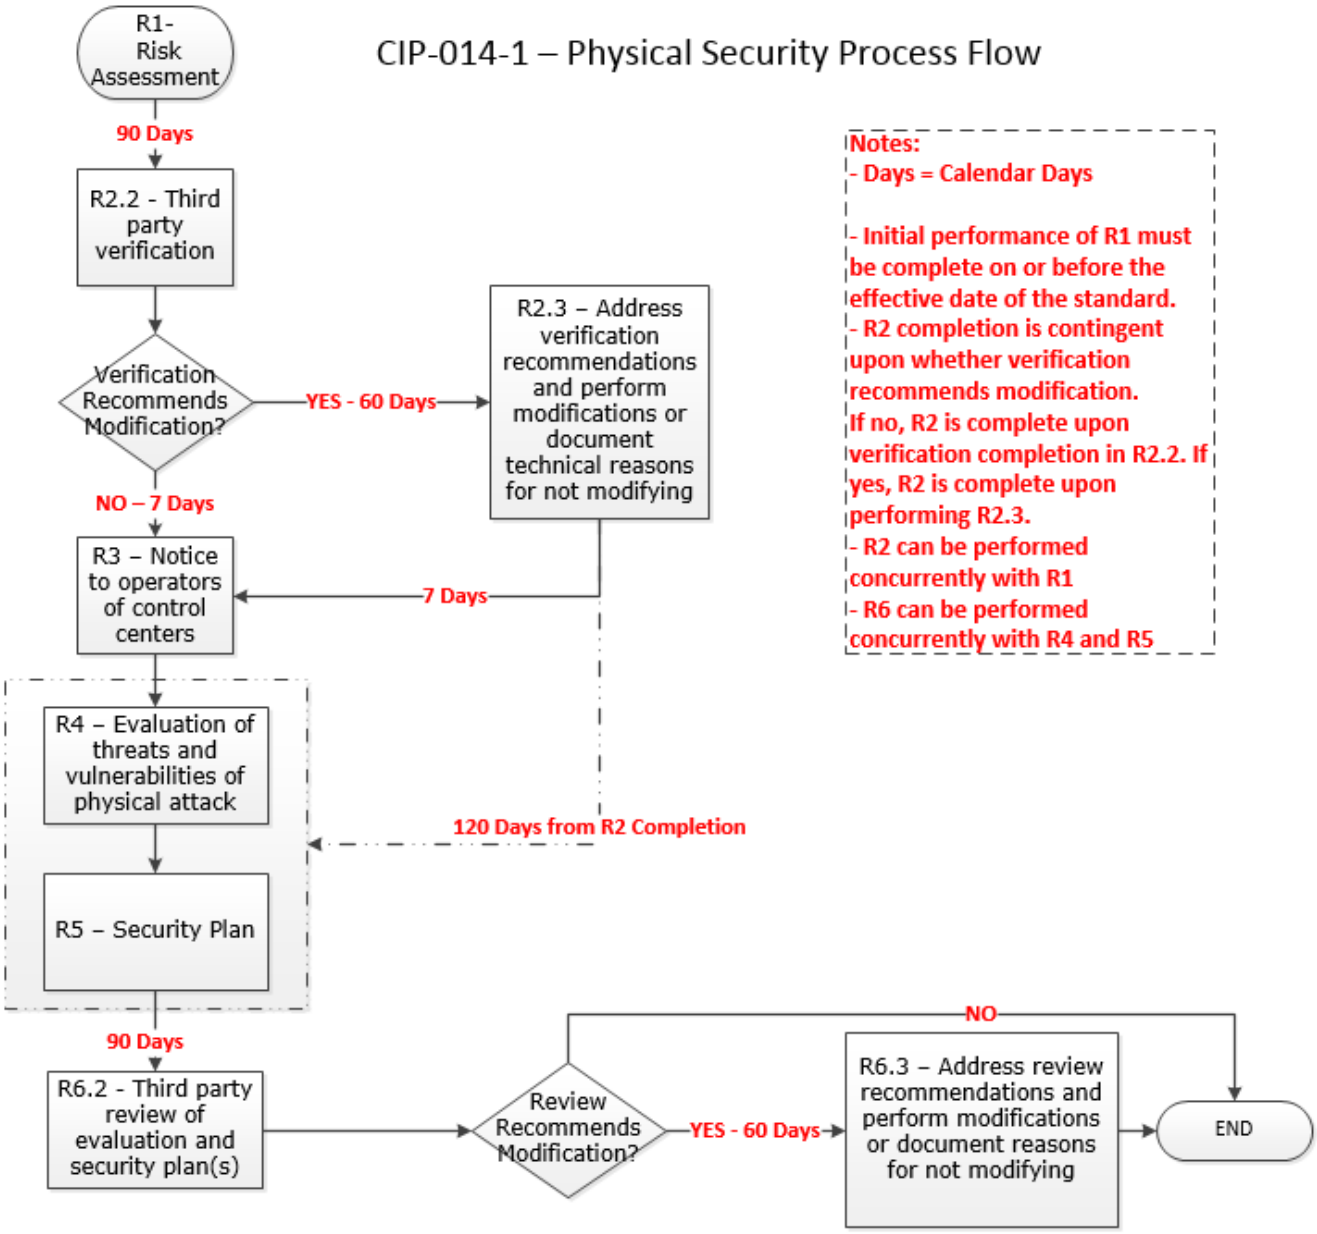


Also, the DT uses the phrase "Transmission stations or Transmission substations" to recognize the existence of both stations and substations. Many entities in industry consider a substation to be a location with physical borders (i.e., fence, wall, etc.) that contains at least an autotransformer. Locations also exist that do not contain autotransformers, and many entities in industry refer to those locations as stations (switching stations or switchyards). Therefore, the DT chose to use both "station" and "substation" to refer to the locations where groups of Transmission Facilities exist.

On the issue of joint ownership, the DT recognizes that this issue is not unique to CIP-014, and expects that the applicable TOs and TOPs will develop memorandums of understanding, agreements, Coordinated Functional Registrations, or procedures, etc., to designate responsibilities under CIP-014 when joint ownership is at issue, which is similar to what many entities have completed for other Reliability Standards.

The language contained in the applicability section regarding the collector bus is directly copied from CIP-002-5.1a, Attachment 1, and has no additional meaning within the CIP-014 standard.

Timeline



CIP-014-1 – Physical Security Process Flow
R1- Risk Assessment
90 Days
R2.2 - Third party verification
Verification Recommends Modification?
YES - 60 Days
R2.3 – Address verification recommendations and perform modifications or document technical reasons for not modifying
NO – 7 Days
R3 – Notice to operators of control centers
7 Days
R4 – Evaluation of threats and vulnerabilities of physical attack
120 Days from R2 Completion
R5 – Security Plan
90 Days
R6.2 - Third party review of evaluation and security plan(s)
Review Recommends Modification?
YES - 60 Days
NO
R6.3 – Address review recommendations and perform modifications or document reasons for not modifying
END
Notes:
- Days = Calendar Days
- Initial performance of R1 must be complete on or before the effective date of the standard.
- R2 completion is contingent upon whether verification recommends modification. If no, R2 is complete upon verification completion in R2.2. If yes, R2 is complete upon performing R2.3.
- R2 can be performed concurrently with R1
- R6 can be performed concurrently with R4 and R5

Rationale

During development of this standard, text boxes were embedded within the standard to explain the rationale for various parts of the standard. Upon Board of Trustees approval, the text from the rationale text boxes was moved to this section.

Rationale for Requirement R1 (This is for the old Requirement R1 in CIP-014-3):
This requirement meets the FERC directive from paragraph 6 of its March 7, 2014 order on physical security to perform a risk assessment to identify which facilities if rendered inoperable or damaged could impact an Interconnection through instability, uncontrolled separation, or cascading failures. The requirement is not intended to bring within the scope of the standard a Transmission station or Transmission substation unless the applicable TO determines through technical studies and analyses based on objective analysis, technical expertise, operating experience and experienced judgment that the loss of such facility would have a critical impact on the operation of the Interconnection in the event the asset is rendered inoperable or damaged. In the November 20, 2014 Order, FERC reiterated that "only an instability that has a "critical impact on the operation of the interconnection" warrants finding that the facility causing the instability is critical under Requirement R1." The TO may determine the criteria for critical impact by considering, among other criteria, any of the following:

- Criteria or methodology used by Transmission Planners or Planning Coordinators in TPL-001-4, Requirement R6
- NERC EOP-004-4~~2~~ reporting criteria
- Area or magnitude of potential impact

Requirement R1 also meets the FERC directive for periodic reevaluation of the risk assessment by requiring the risk assessment to be performed every 30 months (or 60 months for an entity that has not identified in a previous risk assessment any Transmission stations or Transmission substations that if rendered inoperable or damaged could result in instability, uncontrolled separation, or Cascading within an Interconnection).

After identifying each Transmission station and Transmission substation that meets the criteria in Requirement R1, it is important to additionally identify the primary control center that operationally controls that Transmission station or Transmission substation (i.e., the control center whose electronic actions can cause direct physical actions at the identified Transmission station and Transmission substation, such as opening a breaker, compared to a control center that only has the ability to monitor the Transmission station and Transmission substation and, therefore, must coordinate direct physical action through another entity).

Rationale for Requirement R2 (This is now Requirement R6 in CIP-014-4):
This requirement meets the FERC directive from paragraph 11 in the order on physical security requiring verification by an entity other than the owner or operator of the risk assessment performed under Requirement R1.

This requirement provides the flexibility for a TO to select registered and non-registered entities with transmission planning or analysis experience to perform the verification of the Requirement R1 risk assessment. The term "unaffiliated" means that the selected verifying entity cannot be a corporate affiliate (i.e., the verifying entity cannot be an entity that controls, is controlled by, or is under common control with, the TO). The verifying entity also cannot be a division of the TO that operates as a functional unit. The term "unaffiliated" is not intended to prohibit a governmental entity from using another government entity to be a verifier under Requirement R2.

Requirement R2 also provides the TO the flexibility to work with the verifying entity throughout the Requirement R1 risk assessment, which for some TO may be more efficient and effective. In other words, a TO could coordinate with their unaffiliated verifying entity to perform a Requirement R1 risk assessment to satisfy both Requirement R1 and Requirement R2 concurrently.

Planning Coordinator is a functional entity listed in Part 2.1. The Planning Coordinator and Planning Authority are the same entity as shown in the NERC Glossary of Terms Used in NERC Reliability Standards.

Rationale for Requirement R3 (This is now Requirement R7 in CIP-014-4):
Some TOPs will have obligations under this standard for certain primary control centers. Those obligations, however, are contingent upon a TO first identifying which Transmission stations and Transmission substations meet the criteria specified by Requirement R1, as verified according to Requirement R2. This requirement is intended to ensure that a TOP that has operational control of a primary control center identified in Requirement R1, Part 1.2 of a Transmission station or Transmission substation verified according to Requirement R2 receives notice of such identification so that the TOP may timely fulfill its resulting obligations under Requirements R4 through R6. Since the timing obligations in Requirements R4 through R6 are based upon completion of Requirement R2, the TO must also include notice of the date of completion of Requirement R2. Similarly, the TO must notify the TOP of any removals from identification that result from a subsequent risk assessment under Requirement R1 or the verification process under Requirement R2.

Rationale for Requirement R4 (This is now Requirement R8 in CIP-014-4):
This requirement meets the FERC directive from paragraph 8 in the order on physical security that the reliability standard must require tailored evaluation of potential threats and vulnerabilities to facilities identified in Requirement R1 and verified according to Requirement R2. Threats and vulnerabilities may vary from facility to facility based on factors such as the facility's location, size, function, existing protections, and attractiveness of the target. As such, the requirement does not mandate a one-size-fits-all approach but requires entities to account for the unique characteristics of their facilities.

Requirement R4 does not explicitly state when the evaluation of threats and vulnerabilities must occur or be completed. However, Requirement R5 requires that the entity's security plan(s), which is dependent on the Requirement R4 evaluation, must be completed within 120 calendar days following completion of Requirement R2. Thus, an entity has the flexibility when to complete the Requirement R4 evaluation, provided that it is completed in time to comply with the requirement in Requirement R5 to develop a physical security plan 120 calendar days following completion of Requirement R2.

Rationale for Requirement R5 (This is now Requirement R9 in CIP-014-4):
This requirement meets the FERC directive from paragraph 9 in the order on physical security requiring the development and implementation of a security plan(s) designed to protect against attacks to the facilities identified in Requirement R1 based on the assessment performed under Requirement R4.

Rationale for Requirement R6 (This is now Requirement R10 in CIP-014-4):
This requirement meets the FERC directive from paragraph 11 in the order on physical security requiring review by an entity other than the owner or operator with appropriate expertise of the evaluation performed according to Requirement R4 and the security plan(s) developed according to Requirement R5.

As with the verification required by Requirement R2, Requirement R6 provides TOs and TOPs the flexibility to work with the third party reviewer throughout the Requirement R4 evaluation and the development of the Requirement R5 security plan(s). This would allow entities to satisfy their obligations under Requirement R6 concurrent with the satisfaction of their obligations under Requirements R4 and R5.

NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

Violation Risk Factor and Violation Severity Level Justifications

Project 2023-06 CIP-014 Risk Assessment Refinement (CIP-014-4)

This document provides the drafting team's justification for assignment of violation risk factors (VRFs) and violation severity levels (VSLs) for each requirement in CIP-014-4 Physical Security. Each requirement is assigned a VRF and a VSL. These elements support the determination of an initial value range for the Base Penalty Amount regarding violations of requirements in FERC-approved Reliability Standards, as defined in the Electric Reliability Organizations (ERO) Sanction Guidelines. The drafting team applied the following NERC criteria and FERC Guidelines when developing the VRFs and VSLs for the requirements.

NERC Criteria for Violation Risk Factors

High Risk Requirement

A requirement that, if violated, could directly cause or contribute to Bulk Electric System instability, separation, or a cascading sequence of failures, or could place the Bulk Electric System at an unacceptable risk of instability, separation, or cascading failures; or, a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly cause or contribute to Bulk Electric System instability, separation, or a cascading sequence of failures, or could place the Bulk Electric System at an unacceptable risk of instability, separation, or cascading failures, or could hinder restoration to a normal condition.

Medium Risk Requirement

A requirement that, if violated, could directly affect the electrical state or the capability of the Bulk Electric System, or the ability to effectively monitor and control the Bulk Electric System. However, violation of a medium risk requirement is unlikely to lead to Bulk Electric System instability, separation, or cascading failures; or, a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or capability of the Bulk Electric System, or the ability to effectively monitor, control, or restore the Bulk Electric System. However, violation of a medium risk requirement is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to Bulk Electric System instability, separation, or cascading failures, nor to hinder restoration to a normal condition.

Lower Risk Requirement
A requirement that is administrative in nature and a requirement that, if violated, would not be expected to adversely affect the electrical state or capability of the Bulk Electric System, or the ability to effectively monitor and control the Bulk Electric System; or, a requirement that is administrative in nature and a requirement in a planning time frame that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to adversely affect the electrical state or capability of the Bulk Electric System, or the ability to effectively monitor, control, or restore the Bulk Electric System.

FERC Guidelines for Violation Risk Factors

Guideline (1) – Consistency with the Conclusions of the Final Blackout Report

FERC seeks to ensure that VRFs assigned to Requirements of Reliability Standards in these identified areas appropriately reflect their historical critical impact on the reliability of the Bulk-Power System. In the VSL Order, FERC listed critical areas (from the Final Blackout Report) where violations could severely affect the reliability of the Bulk-Power System:

- Emergency operations
- Vegetation management
- Operator personnel training
- Protection systems and their coordination
- Operating tools and backup facilities
- Reactive power and voltage control
- System modeling and data exchange
- Communication protocol and facilities
- Requirements to determine equipment ratings
- Synchronized data recorders
- Clearer criteria for operationally critical facilities
- Appropriate use of transmission loading relief.

Guideline (2) – Consistency within a Reliability Standard
FERC expects a rational connection between the sub-Requirement VRF assignments and the main Requirement VRF assignment.

Guideline (3) – Consistency among Reliability Standards
FERC expects the assignment of VRFs corresponding to Requirements that address similar reliability goals in different Reliability Standards would be treated comparably.

Guideline (4) – Consistency with NERC's Definition of the Violation Risk Factor Level
Guideline (4) was developed to evaluate whether the assignment of a particular VRF level conforms to NERC's definition of that risk level.

Guideline (5) – Treatment of Requirements that Co-mingle More Than One Obligation
Where a single Requirement co-mingles a higher risk reliability objective and a lesser risk reliability objective, the VRF assignment for such Requirements must not be watered down to reflect the lower risk level associated with the less important objective of the Reliability Standard.

NERC Criteria for Violation Severity Levels

VSLs define the degree to which compliance with a requirement was not achieved. Each requirement must have at least one VSL. While it is preferable to have four VSLs for each requirement, some requirements do not have multiple "degrees" of non-compliant performance and may have only one, two, or three VSLs.

VSLs should be based on NERC's overarching criteria shown in the table below:

Lower VSL	Moderate VSL	High VSL	Severe VSL
The performance or product measured almost meets the full intent of the requirement.	The performance or product measured meets the majority of the intent of the requirement.	The performance or product measured does not meet the majority of the intent of the requirement, but does meet some of the intent.	The performance or product measured does not substantively meet the intent of the requirement.

FERC Order of Violation Severity Levels

The FERC VSL guidelines are presented below, followed by an analysis of whether the VSLs proposed for each requirement in the standard meet the FERC Guidelines for assessing VSLs:

Guideline (1) – Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance

Compare the VSLs to any prior levels of non-compliance and avoid significant changes that may encourage a lower level of compliance than was required when levels of non-compliance were used.

Guideline (2) – Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties

A violation of a "binary" type requirement must be a "Severe" VSL.
Do not use ambiguous terms such as "minor" and "significant" to describe non-compliant performance.

Guideline (3) – Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement

VSLs should not expand on what is required in the requirement.

Guideline (4) – Violation Severity Level Assignment Should Be Based on a Single Violation, Not on a Cumulative Number of Violations

Unless otherwise stated in the requirement, each instance of non-compliance with a requirement is a separate violation. Section 4 of the Sanction Guidelines states that assessing penalties on a per violation per day basis is the "default" for penalty calculations.

VRF Justifications for CIP-014-4, Requirement R1	
Proposed VRF	**High**
NERC VRF Discussion	A VRF of higher is appropriate because the requirement, if violated, could directly cause or contribute to Bulk Electric System (BES) instability, separation, or a cascading sequence of failures, or could place the BES at an unacceptable risk of instability, separation, or cascading failures. The VRF is revised and unchanged from the last FERC approved version.
FERC VRF G1 Discussion Guideline 1- Consistency with Blackout Report	This VRF is consistent with the identified areas from the FERC list of critical areas in the Final Blackout Report.
FERC VRF G2 Discussion Guideline 2- Consistency within a Reliability Standard	The VRF for Requirement R1 is consistent with those connections between the sub-Requirement VRF assignments and the main Requirement VRF assignment.
FERC VRF G3 Discussion Guideline 3- Consistency among Reliability Standards	This VRF is consistent with other VRFs that address similar reliability goals in different Reliability Standards.
FERC VRF G4 Discussion Guideline 4- Consistency with NERC Definitions of VRFs	This VRF is consistent with the definition of a High VRF requirement per the criteria filed with FERC as part of the ERO's Sanctions Guidelines.
FERC VRF G5 Discussion Guideline 5- Treatment of Requirements that Co-mingle More	This requirement does not mingle a higher risk reliability objective and a lesser risk reliability objective. Therefore, the VRF reflects the risk of the whole requirement.

VRF Justifications for CIP-014-4, Requirement R1	
Proposed VRF	**High**
than One Obligation	

VSLs for CIP-014-4, Requirement R1			
Lower	**Moderate**	**High**	**Severe**
The Transmission Owner identified each applicable Transmission station(s) and Transmission substation(s) per Attachment 1, but did so after 36 calendar months, but less than or equal to 38 calendar months. OR The Transmission Owner identified each applicable Transmission station(s) and Transmission substation(s), but failed to identify less than or equal to 10% of the applicable Transmission station(s) and Transmission substation(s) per Attachment 1.	The Transmission Owner identified each applicable Transmission station(s) and Transmission substation(s) per Attachment 1, but did so after 38 calendar months, but less than or equal to 40 calendar months. OR The Transmission Owner identified each applicable Transmission station(s) and Transmission substation(s), but failed to identify more than 10% and less than or equal to 20% of the applicable Transmission station(s) and Transmission substation(s) per Attachment 1.	The Transmission Owner identified each applicable Transmission station(s) and Transmission substation(s) per Attachment 1, but did so after 40 calendar months, but less than or equal to 42 calendar months. OR The Transmission Owner identified each applicable Transmission station(s) and Transmission substation(s), but failed to identify more than 20% and less than or equal to 30% of the applicable Transmission station(s) and Transmission substation(s) per Attachment 1.	The Transmission Owner failed to identify each applicable Transmission station(s) and Transmission substation(s) per Attachment 1. OR The Transmission Owner identified each applicable Transmission station(s) and Transmission substation(s) per Attachment 1, but did so after more than 42 calendar months. OR The Transmission Owner identified each applicable Transmission station(s) and Transmission substation(s), but failed to identify more than 30% of the applicable Transmission station(s) and Transmission substation(s) per Attachment 1.

VSL Justifications for CIP-014-4, Requirement R1	
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	The proposed VSLs do not have the unintended consequence of lowering the level of compliance.
FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	The proposed VSLs are not binary and do not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.
FERC VSL G3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	The proposed VSLs use the same terminology as used in the associated requirement and are, therefore, consistent with the requirement.
FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	Each VSL is based on a single violation and not cumulative violations.

VRF Justifications for CIP-014-4, Requirement R2	
Proposed VRF	**Medium**
NERC VRF Discussion	A VRF of Medium is appropriate because, if violated, it could directly affect the electrical state or the capability of the BES, or the ability to effectively monitor and control the BES; however, a violation is unlikely to lead to BES instability, separation, or cascading failures.
FERC VRF G1 Discussion Guideline 1- Consistency with Blackout Report	This VRF is consistent with the identified areas from the FERC list of critical areas in the Final Blackout Report.
FERC VRF G2 Discussion Guideline 2- Consistency within a Reliability Standard	The VRF for Requirement R2 is consistent with those connections between the sub-Requirement VRF assignments and the main Requirement VRF assignment.
FERC VRF G3 Discussion Guideline 3- Consistency among Reliability Standards	This VRF is consistent with other VRFs that address similar reliability goals in different Reliability Standards.
FERC VRF G4 Discussion Guideline 4- Consistency with NERC Definitions of VRFs	This VRF is consistent with the definition of a Medium VRF requirement per the criteria filed with FERC as part of the ERO's Sanctions Guidelines.
FERC VRF G5 Discussion Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation	This requirement does not mingle a higher risk reliability objective and a lesser risk reliability objective. Therefore, the VRF reflects the risk of the whole requirement.

VSLs for CIP-014-4, Requirement R2			
Lower	**Moderate**	**High**	**Severe**
N/A	N/A	N/A	The Transmission Owner with applicable Transmission station(s) or Transmission substation(s) identified in Requirement R1 did not identify existing Bulk Electric System Transmission station(s) and Bulk Electric System Transmission substation(s), irrespective of ownership, within 1500 feet or 457 meters (the shortest distance, measured substation fence line to substation fence line) of an applicable Transmission station or Transmission substation identified in Requirement R1.

VSL Justifications for CIP-014-4, Requirement R2	
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	This is a new Requirement and does not have the unintended consequence of lowering the current level of compliance.
FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties	The proposed VSLs are binary and do not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations. The new Requirement R2 is a binary requirement and thus only assigned a Severe VSL because the Transmission Owners either have or have not identified proximate Transmission station(s) and Transmission substation(s), irrespective of ownership, within 1,500 feet or 457 meters (the shortest distance, measured substation fence line to substation fence line) of an applicable Transmission station or Transmission substation identified in Requirement R1.

VSL Justifications for CIP-014-4, Requirement R2	
Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	
FERC VSL G3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	The proposed VSLs use the same terminology as used in the associated requirement and are, therefore, consistent with the requirement.
FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	Each VSL is based on a single violation and not cumulative violations.

VRF Justifications for CIP-014-4, Requirement R3	
Proposed VRF	**High**
NERC VRF Discussion	A VRF of higher is appropriate because the requirement, if violated, could directly cause or contribute to BES instability, separation, or a cascading sequence of failures, or could place the BES at an unacceptable risk of instability, separation, or cascading failures.
FERC VRF G1 Discussion Guideline 1- Consistency with	This VRF is consistent with the identified areas from the FERC list of critical areas in the Final Blackout Report.

VRF Justifications for CIP-014-4, Requirement R3	
Proposed VRF	**High**
Blackout Report	
FERC VRF G2 Discussion Guideline 2- Consistency within a Reliability Standard	The VRF for Requirement R3 is consistent with those connections between the sub-Requirement VRF assignments and the main Requirement VRF assignment.
FERC VRF G3 Discussion Guideline 3- Consistency among Reliability Standards	This VRF is consistent with other VRFs that address similar reliability goals in different Reliability Standards.
FERC VRF G4 Discussion Guideline 4- Consistency with NERC Definitions of VRFs	This VRF is consistent with the definition of a High VRF requirement per the criteria filed with FERC as part of the ERO's Sanctions Guidelines.
FERC VRF G5 Discussion Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation	This requirement does mingle a higher risk reliability objective and risk reliability objective. Therefore, the VRF reflects the risk of the whole requirement.

VSLs for CIP-014-4, Requirement R3			
Lower	**Moderate**	**High**	**Severe**
N/A	The Transmission Owner has a risk assessment methodology that failed to include one of the requirements listed in Parts 3.1 through 3.3.	The Transmission Owner has a risk assessment methodology that failed to include two of the requirements listed in Parts 3.1 through 3.3.	The Transmission Owner has a risk assessment methodology that failed to include all three of the requirements listed in Parts 3.1 through 3.3. OR The Transmission Owner does not

			have a risk assessment methodology.

VSL Justifications for CIP-014-4, Requirement R3	
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	The proposed VSLs do not have the unintended consequence of lowering the level of compliance.
FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	The proposed VSLs are not binary and do not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.
FERC VSL G3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	The proposed VSLs use the same terminology as used in the associated requirement and are, therefore, consistent with the requirement.
FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single	Each VSL is based on a single violation and not cumulative violations.

VSL Justifications for CIP-014-4, Requirement R3	
Violation, Not on A Cumulative Number of Violations	

VRF Justifications for CIP-014-4, Requirement R4	
Proposed VRF	**Medium**
NERC VRF Discussion	A VRF of Medium is appropriate because, if violated, it could directly affect the electrical state or the capability of the BES, or the ability to effectively monitor and control the BES; however, a violation is unlikely to lead to BES instability, separation, or cascading failures.
FERC VRF G1 Discussion Guideline 1- Consistency with Blackout Report	This VRF is consistent with the identified areas from the FERC list of critical areas in the Final Blackout Report.
FERC VRF G2 Discussion Guideline 2- Consistency within a Reliability Standard	The VRF for Requirement R4 is consistent with those connections between the sub-Requirement VRF assignments and the main Requirement VRF assignment.
FERC VRF G3 Discussion Guideline 3- Consistency among Reliability Standards	This VRF is consistent with other VRFs that address similar reliability goals in different Reliability Standards.
FERC VRF G4 Discussion Guideline 4- Consistency with NERC Definitions of VRFs	This VRF is consistent with the definition of a Medium VRF requirement per the criteria filed with FERC as part of the ERO's Sanctions Guidelines.
FERC VRF G5 Discussion Guideline 5- Treatment of Requirements that Co-mingle More	This requirement does not mingle a higher risk reliability objective and a lesser risk reliability objective. Therefore, the VRF reflects the risk of the whole requirement.

than One Obligation	

VSLs for CIP-014-4, Requirement R4			
Lower	**Moderate**	**High**	**Severe**
The Transmission Owner with applicable Transmission station(s) and Transmission substation(s) identified in Requirement R1 owned by multiple Transmission Owners failed to coordinate with each appropriate Transmission Owner(s) to determine and document their individual and joint responsibilities for documenting a risk assessment methodology under Requirement R3 and for performing any required risk assessments per Requirement R5 for less than or equal to 25% of jointly owned applicable Transmission station(s) and Transmission substation(s).	The Transmission Owner with applicable Transmission station(s) and Transmission substation(s) identified in Requirement R1 owned by multiple Transmission Owners failed to coordinate with each appropriate Transmission Owner(s) to determine and document their individual and joint responsibilities for documenting a risk assessment methodology under Requirement R3 and for performing any required risk assessments per Requirement R5 for more than 25% and less than or equal to 50% of jointly owned applicable Transmission station(s) and Transmission substation(s).	The Transmission Owner with applicable Transmission station(s) and Transmission substation(s) identified in Requirement owned by multiple Transmission Owners failed to coordinate with each appropriate Transmission Owner(s) to determine and document their individual and joint responsibilities for documenting a risk assessment methodology under Requirement R3 and for performing any required risk assessments per Requirement R5 for more than 50% and less than or equal to 75% of jointly owned applicable Transmission station(s) and Transmission substation(s).	The Transmission Owner with applicable Transmission station(s) and Transmission substation(s) identified in Requirement R1 owned by multiple Transmission Owners failed to coordinate with each appropriate Transmission Owner(s) to determine and document their individual and joint responsibilities for documenting a risk assessment methodology under Requirement R3 and for performing any required risk assessments per Requirement R5 for more than 75% and less than or equal to 100% of jointly owned applicable Transmission station(s) and Transmission substation(s).

VSL Justifications for CIP-014-4, Requirement R4	
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	The proposed VSLs do not have the unintended consequence of lowering the level of compliance.
FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	The proposed VSLs are not binary and do not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.
FERC VSL G3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	The proposed VSLs use the same terminology as used in the associated requirement and are, therefore, consistent with the requirement.
FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	Each VSL is based on a single violation and not cumulative violations.

VRF Justifications for CIP-014-4, Requirement R5	
Proposed VRF	**High**
NERC VRF Discussion	The VRF for this new Requirement R5 remains High because it is one of the two sub-Requirements of Requirement R1 from the previously FERC approved CIP-014-3 Reliability Standard.
FERC VRF G1 Discussion Guideline 1- Consistency with Blackout Report	This VRF is consistent with the identified areas from the FERC list of critical areas in the Final Blackout Report.
FERC VRF G2 Discussion Guideline 2- Consistency within a Reliability Standard	The VRF for Requirement R5 is consistent with those connections between the sub-Requirement VRF assignments and the main Requirement VRF assignment.
FERC VRF G3 Discussion Guideline 3- Consistency among Reliability Standards	This VRF is consistent with other VRFs that address similar reliability goals in different Reliability Standards.
FERC VRF G4 Discussion Guideline 4- Consistency with NERC Definitions of VRFs	This VRF is consistent with the definition of a High VRF requirement per the criteria filed with FERC as part of the ERO's Sanctions Guidelines.
FERC VRF G5 Discussion Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation	This requirement does mingle a higher risk reliability objective and risk reliability objective. Therefore, the VRF reflects the risk of the whole requirement.

VSLs for CIP-014-4, Requirement R5			
Lower	**Moderate**	**High**	**Severe**
The Transmission Owner performed a risk assessment, but did so after 36 calendar months, but less than or equal to 38 calendar months.	The Transmission Owner performed a risk assessment, but did so after 38 calendar months, but less than or equal to 40 calendar months. OR The Transmission Owner performed a risk assessment inconsistent with one of the methodology requirements listed in Requirement R3, Parts 3.1 through 3.3.	The Transmission Owner performed a risk assessment, but did so after 40 calendar months, but less than or equal to 42 calendar months. OR The Transmission Owner performed a risk assessment inconsistent with two of the methodology requirements listed in Requirement R3, Parts 3.1 through 3.3. OR The Transmission Owner performed a risk assessment, but failed to include the primary control center identified in Part 5.2.	The Transmission Owner performed a risk assessment, but did so after more than 42 calendar months. OR The Transmission Owner performed a risk assessment inconsistent with all three of the methodology requirements listed in Requirement R3, Parts 3.1 through 3.3.

VSL Justifications for CIP-014-4, Requirement R5	
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	The proposed VSLs do not have the unintended consequence of lowering the level of compliance.
FERC VSL G2 Violation Severity Level Assignments	The proposed VSLs are not binary and do not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.

VSL Justifications for CIP-014-4, Requirement R5	
Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	
FERC VSL G3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	The proposed VSLs use the same terminology as used in the associated requirement and are, therefore, consistent with the requirement.
FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	Each VSL is based on a single violation and not cumulative violations.

VRF Justification for CIP-014-4, Requirement R6

This Requirement is the same as Requirement R2 in CIP-014-3. The VRF did not change from the previously FERC approved CIP-014-3 Reliability Standard.

VSL Justification for CIP-014-4, Requirement R6

The Requirement is the same as Requirement R2 in the previously FERC approved CIP-014-3 Reliability Standard. The VSL did not have material changes except for the reference Requirement numbers because 5 (five) new Requirements were added.

VRF Justification for CIP-014-4, Requirement R7

This Requirement is the same as Requirement R3 in CIP-014-3. The VRF did not change from the previously FERC approved CIP-014-3 Reliability Standard.

VSL Justification for CIP-014-4, Requirement R7

The Requirement is the same as Requirement R3 in the previously FERC approved CIP-014-3 Reliability Standard. The VSL did not have material changes except for the reference Requirement numbers because 5 (five) new Requirements were added.

VRF Justification for CIP-014-4, Requirement R8

This Requirement is the same as Requirement R4 in CIP-014-3. The VRF did not change from the previously FERC approved CIP-014-3 Reliability Standard.

VSL Justification for CIP-014-4, Requirement R8

The Requirement is the same as Requirement R4 in CIP-014-3. The VSL did not have material changes from the previously FERC approved CIP-014-3 Reliability Standard except changed “Responsible Entity” to “responsible entity” and the reference Requirement numbers because 5 (five) new Requirements were added.

VRF Justification for CIP-014-4, Requirement R9

This Requirement is the same as Requirement R5 in CIP-014-3. The VRF did not change from the previously FERC approved CIP-014-3 Reliability Standard.

VSL Justification for CIP-014-4, Requirement R9

The Requirement is the same as Requirement R5 in CIP-014-3. The VSL did not have material change from the previously FERC approved CIP-014-3 Reliability Standard except changed “Responsible Entity” to “responsible entity” and the reference Requirement numbers because 5 (five) new Requirements were added.

VRF Justification for CIP-014-4, Requirement R10

This Requirement is the same as Requirement R6 in CIP-014-3. The VRF did not change from the previously FERC approved CIP-014-3 Reliability Standard.

VSL Justification for CIP-014-4, Requirement R10

VSLs for CIP-014-4, Requirement R10			
Lower	**Moderate**	**High**	**Severe**
The responsible entity had an unaffiliated third party review the evaluation performed under Requirement R8 and the security plan(s) developed under Requirement R9, but did so in more than 90 calendar days, but less than or equal to 100 calendar days. OR The responsible entity had an unaffiliated third party review the evaluation performed under Requirement R8 and the security plan(s) developed under Requirement R9 and modified or documented the reason for not modifying the security plan(s) as specified in Part 10.3, but did so more than 70 calendar days and less than or equal to 80 calendar days following completion of the third party review.	The responsible entity had an unaffiliated third party review the evaluation performed under Requirement R8 and the security plan(s) developed under Requirement R9, but did so in more than 100 calendar days, but less than or equal to 110 calendar days. OR The responsible entity had an unaffiliated third party review the evaluation performed under Requirement R8 and the security plan(s) developed under Requirement R9 and modified or documented the reason for not modifying the security plan(s) as specified in Part 10.3, but did so more than 80 calendar days following completion of the third party review. OR The responsible entity had an unaffiliated third party review the evaluation performed under Requirement R8 and the security plan(s) developed under Requirement R9, but did not document the reason for not	The responsible entity had an unaffiliated third party review the evaluation performed under Requirement R8 and the security plan(s) developed under Requirement R9, but did so more than 110 calendar days, but less than or equal to 120 calendar days. OR The responsible entity failed to have an unaffiliated third party review the evaluation performed under Requirement R8 and the security plan(s) developed under Requirement R9. OR The responsible entity had an unaffiliated third party review the evaluation performed under Requirement R8 and the security plan(s) developed under Requirement R9, but failed to implement procedures for protecting information per Part 10.4.	The responsible entity failed to have an unaffiliated third party review the evaluation performed under Requirement R8 and the security plan(s) developed under Requirement R9 in more than 120 calendar days.

	modifying the security plan(s) as specified in Part 10.3.		

VSL Justifications for CIP-014-4, Requirement R10	
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	This is an existing Requirement. The drafting team revised the VSL language for consistency with the proposed revisions to the standard. All of the violation severity levels stayed the same from the previously FERC-approved version
FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	The proposed VSLs are not binary and do not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.
FERC VSL G3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	The proposed VSLs use the same terminology as used in the associated requirement and are, therefore, consistent with the requirement.
FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative	Each VSL is based on a single violation and not cumulative violations.

Number of Violations

NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

Violation Risk Factor and Violation Severity Level Justifications

Project 2023-06 CIP-014 Risk Assessment Refinement (CIP-014-4)

This document provides the drafting team's justification for assignment of violation risk factors (VRFs) and violation severity levels (VSLs) for each requirement in CIP-014-4 Physical Security. Each requirement is assigned a VRF and a VSL. These elements support the determination of an initial value range for the Base Penalty Amount regarding violations of requirements in FERC-approved Reliability Standards, as defined in the Electric Reliability Organizations (ERO) Sanction Guidelines. The drafting team applied the following NERC criteria and FERC Guidelines when developing the VRFs and VSLs for the requirements.

NERC Criteria for Violation Risk Factors

High Risk Requirement

A requirement that, if violated, could directly cause or contribute to Bulk Electric System instability, separation, or a cascading sequence of failures, or could place the Bulk Electric System at an unacceptable risk of instability, separation, or cascading failures; or, a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly cause or contribute to Bulk Electric System instability, separation, or a cascading sequence of failures, or could place the Bulk Electric System at an unacceptable risk of instability, separation, or cascading failures, or could hinder restoration to a normal condition.

Medium Risk Requirement

A requirement that, if violated, could directly affect the electrical state or the capability of the Bulk Electric System, or the ability to effectively monitor and control the Bulk Electric System. However, violation of a medium risk requirement is unlikely to lead to Bulk Electric System instability, separation, or cascading failures; or, a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or capability of the Bulk Electric System, or the ability to effectively monitor, control, or restore the Bulk Electric System. However, violation of a medium risk requirement is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to Bulk Electric System instability, separation, or cascading failures, nor to hinder restoration to a normal condition.

Lower Risk Requirement
A requirement that is administrative in nature and a requirement that, if violated, would not be expected to adversely affect the electrical state or capability of the Bulk Electric System, or the ability to effectively monitor and control the Bulk Electric System; or, a requirement that is administrative in nature and a requirement in a planning time frame that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to adversely affect the electrical state or capability of the Bulk Electric System, or the ability to effectively monitor, control, or restore the Bulk Electric System.

FERC Guidelines for Violation Risk Factors

Guideline (1) – Consistency with the Conclusions of the Final Blackout Report

FERC seeks to ensure that VRFs assigned to Requirements of Reliability Standards in these identified areas appropriately reflect their historical critical impact on the reliability of the Bulk-Power System. In the VSL Order, FERC listed critical areas (from the Final Blackout Report) where violations could severely affect the reliability of the Bulk-Power System:

- Emergency operations
- Vegetation management
- Operator personnel training
- Protection systems and their coordination
- Operating tools and backup facilities
- Reactive power and voltage control
- System modeling and data exchange
- Communication protocol and facilities
- Requirements to determine equipment ratings
- Synchronized data recorders
- Clearer criteria for operationally critical facilities
- Appropriate use of transmission loading relief.

Guideline (2) – Consistency within a Reliability Standard
FERC expects a rational connection between the sub-Requirement VRF assignments and the main Requirement VRF assignment.

Guideline (3) – Consistency among Reliability Standards
FERC expects the assignment of VRFs corresponding to Requirements that address similar reliability goals in different Reliability Standards would be treated comparably.

Guideline (4) – Consistency with NERC's Definition of the Violation Risk Factor Level
Guideline (4) was developed to evaluate whether the assignment of a particular VRF level conforms to NERC's definition of that risk level.

Guideline (5) – Treatment of Requirements that Co-mingle More Than One Obligation
Where a single Requirement co-mingles a higher risk reliability objective and a lesser risk reliability objective, the VRF assignment for such Requirements must not be watered down to reflect the lower risk level associated with the less important objective of the Reliability Standard.

NERC Criteria for Violation Severity Levels

VSLs define the degree to which compliance with a requirement was not achieved. Each requirement must have at least one VSL. While it is preferable to have four VSLs for each requirement, some requirements do not have multiple "degrees" of non-compliant performance and may have only one, two, or three VSLs.

VSLs should be based on NERC's overarching criteria shown in the table below:

Lower VSL	Moderate VSL	High VSL	Severe VSL
The performance or product measured almost meets the full intent of the requirement.	The performance or product measured meets the majority of the intent of the requirement.	The performance or product measured does not meet the majority of the intent of the requirement, but does meet some of the intent.	The performance or product measured does not substantively meet the intent of the requirement.

FERC Order of Violation Severity Levels

The FERC VSL guidelines are presented below, followed by an analysis of whether the VSLs proposed for each requirement in the standard meet the FERC Guidelines for assessing VSLs:

Guideline (1) – Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance

Compare the VSLs to any prior levels of non-compliance and avoid significant changes that may encourage a lower level of compliance than was required when levels of non-compliance were used.

Guideline (2) – Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties

A violation of a "binary" type requirement must be a "Severe" VSL.
Do not use ambiguous terms such as "minor" and "significant" to describe non-compliant performance.

Guideline (3) – Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement

VSLs should not expand on what is required in the requirement.

Guideline (4) – Violation Severity Level Assignment Should Be Based on a Single Violation, Not on a Cumulative Number of Violations

Unless otherwise stated in the requirement, each instance of non-compliance with a requirement is a separate violation. Section 4 of the Sanction Guidelines states that assessing penalties on a per violation per day basis is the "default" for penalty calculations.

VRF Justifications for CIP-014-4, Requirement R1	
Proposed VRF	**High**
NERC VRF Discussion	A VRF of higher is appropriate because the requirement, if violated, could directly cause or contribute to Bulk Electric System (BES) instability, separation, or a cascading sequence of failures, or could place the BES at an unacceptable risk of instability, separation, or cascading failures. The VRF is revised and unchanged from the last FERC approved version.
FERC VRF G1 Discussion Guideline 1- Consistency with Blackout Report	This VRF is consistent with the identified areas from the FERC list of critical areas in the Final Blackout Report.
FERC VRF G2 Discussion Guideline 2- Consistency within a Reliability Standard	The VRF for Requirement R1 is consistent with those connections between the sub-Requirement VRF assignments and the main Requirement VRF assignment.
FERC VRF G3 Discussion Guideline 3- Consistency among Reliability Standards	This VRF is consistent with other VRFs that address similar reliability goals in different Reliability Standards.
FERC VRF G4 Discussion Guideline 4- Consistency with NERC Definitions of VRFs	This VRF is consistent with the definition of a High VRF requirement per the criteria filed with FERC as part of the ERO's Sanctions Guidelines.
FERC VRF G5 Discussion Guideline 5- Treatment of Requirements that Co-mingle More	This requirement does not mingle a higher risk reliability objective and a lesser risk reliability objective. Therefore, the VRF reflects the risk of the whole requirement.

VRF Justifications for CIP-014-4, Requirement R1	
Proposed VRF	**High**
than One Obligation	

VSLs for CIP-014-4, Requirement R1			
Lower	**Moderate**	**High**	**Severe**
The Transmission Owner identified each applicable Transmission station(s) and Transmission substation(s) per Attachment 1, but did so after 36 calendar months, but less than or equal to 38 calendar months. OR The Transmission Owner identified each applicable Transmission station(s) and Transmission substation(s), but failed to identify less than or equal to 10% of the applicable Transmission station(s) and Transmission substation(s) per Attachment 1.	The Transmission Owner identified each applicable Transmission station(s) and Transmission substation(s) per Attachment 1, but did so after 38 calendar months, but less than or equal to 40 calendar months. OR The Transmission Owner identified each applicable Transmission station(s) and Transmission substation(s), but failed to identify more than 10% and less than or equal to 20% of the applicable Transmission station(s) and Transmission substation(s) per Attachment 1.	The Transmission Owner identified each applicable Transmission station(s) and Transmission substation(s) per Attachment 1, but did so after 40 calendar months, but less than or equal to 42 calendar months. OR The Transmission Owner identified each applicable Transmission station(s) and Transmission substation(s), but failed to identify more than 20% and less than or equal to 30% of the applicable Transmission station(s) and Transmission substation(s) per Attachment 1.	The Transmission Owner failed to identify each applicable Transmission station(s) and Transmission substation(s) per Attachment 1. OR The Transmission Owner identified each applicable Transmission station(s) and Transmission substation(s) per Attachment 1, but did so after more than 42 calendar months. OR The Transmission Owner identified each applicable Transmission station(s) and Transmission substation(s), but failed to identify more than 30% of the applicable Transmission station(s) and Transmission substation(s) per Attachment 1.

VSL Justifications for CIP-014-4, Requirement R1	
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	The proposed VSLs do not have the unintended consequence of lowering the level of compliance.
FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	The proposed VSLs are not binary and do not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.
FERC VSL G3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	The proposed VSLs use the same terminology as used in the associated requirement and are, therefore, consistent with the requirement.
FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	Each VSL is based on a single violation and not cumulative violations.

VRF Justifications for CIP-014-4, Requirement R2	
Proposed VRF	**Medium**
NERC VRF Discussion	A VRF of Medium is appropriate because, if violated, it could directly affect the electrical state or the capability of the BES, or the ability to effectively monitor and control the BES; however, a violation is unlikely to lead to BES instability, separation, or cascading failures.
FERC VRF G1 Discussion Guideline 1- Consistency with Blackout Report	This VRF is consistent with the identified areas from the FERC list of critical areas in the Final Blackout Report.
FERC VRF G2 Discussion Guideline 2- Consistency within a Reliability Standard	The VRF for Requirement R2 is consistent with those connections between the sub-Requirement VRF assignments and the main Requirement VRF assignment.
FERC VRF G3 Discussion Guideline 3- Consistency among Reliability Standards	This VRF is consistent with other VRFs that address similar reliability goals in different Reliability Standards.
FERC VRF G4 Discussion Guideline 4- Consistency with NERC Definitions of VRFs	This VRF is consistent with the definition of a Medium VRF requirement per the criteria filed with FERC as part of the ERO's Sanctions Guidelines.
FERC VRF G5 Discussion Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation	This requirement does not mingle a higher risk reliability objective and a lesser risk reliability objective. Therefore, the VRF reflects the risk of the whole requirement.

VSLs for CIP-014-4, Requirement R2			
Lower	**Moderate**	**High**	**Severe**
N/A	N/A	N/A	The Transmission Owner with applicable Transmission station(s) or Transmission substation(s) identified in Requirement R1 did not identify existing Bulk Electric System Transmission station(s) and Bulk Electric System Transmission substation(s), irrespective of ownership, within 1500 feet or 457 meters (the shortest distance, measured substation fence line to substation fence line) of an applicable Transmission station or Transmission substation identified in Requirement R1.

VSL Justifications for CIP-014-4, Requirement R2	
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	This is a new Requirement and does not have the unintended consequence of lowering the current level of compliance.
FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties	The proposed VSLs are binary and do not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations. The new Requirement R2 is a binary requirement and thus only assigned a Severe VSL because the Transmission Owners either have or have not identified proximate Transmission station(s) and Transmission substation(s), irrespective of ownership, within 1,500 feet or 457 meters (the shortest distance, measured substation fence line to substation fence line) of an applicable Transmission station or Transmission substation identified in Requirement R1.

VSL Justifications for CIP-014-4, Requirement R2	
Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	
FERC VSL G3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	The proposed VSLs use the same terminology as used in the associated requirement and are, therefore, consistent with the requirement.
FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	Each VSL is based on a single violation and not cumulative violations.

VRF Justifications for CIP-014-4, Requirement R3	
Proposed VRF	**High**
NERC VRF Discussion	A VRF of higher is appropriate because the requirement, if violated, could directly cause or contribute to BES instability, separation, or a cascading sequence of failures, or could place the BES at an unacceptable risk of instability, separation, or cascading failures.
FERC VRF G1 Discussion Guideline 1- Consistency with	This VRF is consistent with the identified areas from the FERC list of critical areas in the Final Blackout Report.

VRF Justifications for CIP-014-4, Requirement R3	
Proposed VRF	**High**
Blackout Report	
FERC VRF G2 Discussion Guideline 2- Consistency within a Reliability Standard	The VRF for Requirement R3 is consistent with those connections between the sub-Requirement VRF assignments and the main Requirement VRF assignment.
FERC VRF G3 Discussion Guideline 3- Consistency among Reliability Standards	This VRF is consistent with other VRFs that address similar reliability goals in different Reliability Standards.
FERC VRF G4 Discussion Guideline 4- Consistency with NERC Definitions of VRFs	This VRF is consistent with the definition of a High VRF requirement per the criteria filed with FERC as part of the ERO's Sanctions Guidelines.
FERC VRF G5 Discussion Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation	This requirement does mingle a higher risk reliability objective and risk reliability objective. Therefore, the VRF reflects the risk of the whole requirement.

VSLs for CIP-014-4, Requirement R3			
Lower	**Moderate**	**High**	**Severe**
N/A	The Transmission Owner has a risk assessment methodology that failed to include one of the requirements listed in Parts 3.1 through 3.3.	The Transmission Owner has a risk assessment methodology that failed to include two of the requirements listed in Parts 3.1 through 3.3.	The Transmission Owner has a risk assessment methodology that failed to include all three of the requirements listed in Parts 3.1 through 3.3. OR The Transmission Owner does not

			have a risk assessment methodology.

VSL Justifications for CIP-014-4, Requirement R3	
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	The proposed VSLs do not have the unintended consequence of lowering the level of compliance.
FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	The proposed VSLs are not binary and do not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.
FERC VSL G3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	The proposed VSLs use the same terminology as used in the associated requirement and are, therefore, consistent with the requirement.
FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single	Each VSL is based on a single violation and not cumulative violations.

VSL Justifications for CIP-014-4, Requirement R3	
Violation, Not on A Cumulative Number of Violations	

VRF Justifications for CIP-014-4, Requirement R4	
Proposed VRF	**Medium**
NERC VRF Discussion	A VRF of Medium is appropriate because, if violated, it could directly affect the electrical state or the capability of the BES, or the ability to effectively monitor and control the BES; however, a violation is unlikely to lead to BES instability, separation, or cascading failures.
FERC VRF G1 Discussion Guideline 1- Consistency with Blackout Report	This VRF is consistent with the identified areas from the FERC list of critical areas in the Final Blackout Report.
FERC VRF G2 Discussion Guideline 2- Consistency within a Reliability Standard	The VRF for Requirement R4 is consistent with those connections between the sub-Requirement VRF assignments and the main Requirement VRF assignment.
FERC VRF G3 Discussion Guideline 3- Consistency among Reliability Standards	This VRF is consistent with other VRFs that address similar reliability goals in different Reliability Standards.
FERC VRF G4 Discussion Guideline 4- Consistency with NERC Definitions of VRFs	This VRF is consistent with the definition of a Medium VRF requirement per the criteria filed with FERC as part of the ERO's Sanctions Guidelines.
FERC VRF G5 Discussion Guideline 5- Treatment of Requirements that Co-mingle More	This requirement does not mingle a higher risk reliability objective and a lesser risk reliability objective. Therefore, the VRF reflects the risk of the whole requirement.

VRF Justifications for CIP-014-4, Requirement R4	
Proposed VRF	**Medium**
than One Obligation	

VSLs for CIP-014-4, Requirement R4			
Lower	**Moderate**	**High**	**Severe**
The Transmission Owner with applicable Transmission station(s) and Transmission substation(s) identified in Requirement R1 owned by multiple Transmission Owners failed to coordinate with each appropriate Transmission Owner(s) to determine and document their individual and joint responsibilities for documenting a risk assessment methodology under Requirement R3 and for performing any required risk assessments per Requirement R5 for less than or equal to 25% of jointly owned applicable Transmission station(s) and Transmission substation(s).	The Transmission Owner with applicable Transmission station(s) and Transmission substation(s) identified in Requirement R1 owned by multiple Transmission Owners failed to coordinate with each appropriate Transmission Owner(s) to determine and document their individual and joint responsibilities for documenting a risk assessment methodology under Requirement R3 and for performing any required risk assessments per Requirement R5 for more than 25% and less than or equal to 50% of jointly owned applicable Transmission station(s) and Transmission substation(s).	The Transmission Owner with applicable Transmission station(s) and Transmission substation(s) identified in Requirement owned by multiple Transmission Owners failed to coordinate with each appropriate Transmission Owner(s) to determine and document their individual and joint responsibilities for documenting a risk assessment methodology under Requirement R3 and for performing any required risk assessments per Requirement R5 for more than 50% and less than or equal to 75% of jointly owned applicable Transmission station(s) and Transmission substation(s).	The Transmission Owner with applicable Transmission station(s) and Transmission substation(s) identified in Requirement R1 owned by multiple Transmission Owners failed to coordinate with each appropriate Transmission Owner(s) to determine and document their individual and joint responsibilities for documenting a risk assessment methodology under Requirement R3 and for performing any required risk assessments per Requirement R5 for more than 75% and less than or equal to 100% of ~~any evidence for~~ jointly owned applicable Transmission station(s) and Transmission substation(s).

VSL Justifications for CIP-014-4, Requirement R4	
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	The proposed VSLs do not have the unintended consequence of lowering the level of compliance.
FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	The proposed VSLs are not binary and do not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.
FERC VSL G3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	The proposed VSLs use the same terminology as used in the associated requirement and are, therefore, consistent with the requirement.
FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	Each VSL is based on a single violation and not cumulative violations.

VRF Justifications for CIP-014-4, Requirement R5	
Proposed VRF	**High**
NERC VRF Discussion	The VRF for this new Requirement R5 remains High because it is one of the two sub-Requirements of Requirement R1 from the previously FERC approved CIP-014-3 Reliability Standard.
FERC VRF G1 Discussion Guideline 1- Consistency with Blackout Report	This VRF is consistent with the identified areas from the FERC list of critical areas in the Final Blackout Report.
FERC VRF G2 Discussion Guideline 2- Consistency within a Reliability Standard	The VRF for Requirement R5 is consistent with those connections between the sub-Requirement VRF assignments and the main Requirement VRF assignment.
FERC VRF G3 Discussion Guideline 3- Consistency among Reliability Standards	This VRF is consistent with other VRFs that address similar reliability goals in different Reliability Standards.
FERC VRF G4 Discussion Guideline 4- Consistency with NERC Definitions of VRFs	This VRF is consistent with the definition of a High VRF requirement per the criteria filed with FERC as part of the ERO's Sanctions Guidelines.
FERC VRF G5 Discussion Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation	This requirement does mingle a higher risk reliability objective and risk reliability objective. Therefore, the VRF reflects the risk of the whole requirement.

VSLs for CIP-014-4, Requirement R5			
Lower	**Moderate**	**High**	**Severe**
The Transmission Owner performed a risk assessment, but did so after 36 calendar months, but less than or equal to 38 calendar months.	The Transmission Owner performed a risk assessment, but did so after 38 calendar months, but less than or equal to 40 calendar months. OR The Transmission Owner performed a risk assessment inconsistent with one of the methodology requirements listed in Requirement R3, Parts 3.1 through 3.3.	The Transmission Owner performed a risk assessment, but did so after 40 calendar months, but less than or equal to 42 calendar months. OR The Transmission Owner performed a risk assessment inconsistent with two of the methodology requirements listed in Requirement R3, Parts 3.1 through 3.3. OR The Transmission Owner performed a risk assessment, but failed to include the primary control center identified in Part 5.2.	The Transmission Owner performed a risk assessment, but did so after more than 42 calendar months. OR The Transmission Owner performed a risk assessment inconsistent with all three of the methodology requirements listed in Requirement R3, Parts 3.1 through 3.3.

VSL Justifications for CIP-014-4, Requirement R5	
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	The proposed VSLs do not have the unintended consequence of lowering the level of compliance.
FERC VSL G2 Violation Severity Level Assignments	The proposed VSLs are not binary and do not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.

VSL Justifications for CIP-014-4, Requirement R5	
Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	
FERC VSL G3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	The proposed VSLs use the same terminology as used in the associated requirement and are, therefore, consistent with the requirement.
FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	Each VSL is based on a single violation and not cumulative violations.

VRF Justification for CIP-014-4, Requirement R6

This Requirement is the same as Requirement R2 in CIP-014-3. The VRF did not change from the previously FERC approved CIP-014-3 Reliability Standard.

VSL Justification for CIP-014-4, Requirement R6

The Requirement is the same as Requirement R2 in the previously FERC approved CIP-014-3 Reliability Standard. The VSL did not have material changes except for the reference Requirement numbers because 5 (five) new Requirements were added.

VRF Justification for CIP-014-4, Requirement R7

This Requirement is the same as Requirement R3 in CIP-014-3. The VRF did not change from the previously FERC approved CIP-014-3 Reliability Standard.

VSL Justification for CIP-014-4, Requirement R7

The Requirement is the same as Requirement R3 in the previously FERC approved CIP-014-3 Reliability Standard. The VSL did not have material changes except for the reference Requirement numbers because 5 (five) new Requirements were added.

VRF Justification for CIP-014-4, Requirement R8

This Requirement is the same as Requirement R4 in CIP-014-3. The VRF did not change from the previously FERC approved CIP-014-3 Reliability Standard.

VSL Justification for CIP-014-4, Requirement R8

The Requirement is the same as Requirement R4 in CIP-014-3. The VSL did not have material changes from the previously FERC approved CIP-014-3 Reliability Standard except changed “Responsible Entity” to “responsible entity” and the reference Requirement numbers because 5 (five) new Requirements were added.

VRF Justification for CIP-014-4, Requirement R9

This Requirement is the same as Requirement R5 in CIP-014-3. The VRF did not change from the previously FERC approved CIP-014-3 Reliability Standard.

VSL Justification for CIP-014-4, Requirement R9

The Requirement is the same as Requirement R5 in CIP-014-3. The VSL did not have material change from the previously FERC approved CIP-014-3 Reliability Standard except changed “Responsible Entity” to “responsible entity” and the reference Requirement numbers because 5 (five) new Requirements were added.

VRF Justification for CIP-014-4, Requirement R10

This Requirement is the same as Requirement R6 in CIP-014-3. The VRF did not change from the previously FERC approved CIP-014-3 Reliability Standard.

VSL Justification for CIP-014-4, Requirement R10

VSLs for CIP-014-4, Requirement R10			
Lower	**Moderate**	**High**	**Severe**
The responsible entity had an unaffiliated third party review the evaluation performed under Requirement R8 and the security plan(s) developed under Requirement R9, but did so in more than 90 calendar days, but less than or equal to 100 calendar days. OR The responsible entity had an unaffiliated third party review the evaluation performed under Requirement R8 and the security plan(s) developed under Requirement R9 and modified or documented the reason for not modifying the security plan(s) as specified in Part 10.3, but did so more than 70 calendar days and less than or equal to 80 calendar days following completion of the third party review.	The responsible entity had an unaffiliated third party review the evaluation performed under Requirement R8 and the security plan(s) developed under Requirement R9, but did so in more than 100 calendar days, but less than or equal to 110 calendar days. OR The responsible entity had an unaffiliated third party review the evaluation performed under Requirement R8 and the security plan(s) developed under Requirement R9 and modified or documented the reason for not modifying the security plan(s) as specified in Part 10.3, but did so more than 80 calendar days following completion of the third party review. OR The responsible entity had an unaffiliated third party review the evaluation performed under Requirement R8 and the security plan(s) developed under Requirement R9, but did not document the reason for not	The responsible entity had an unaffiliated third party review the evaluation performed under Requirement R8 and the security plan(s) developed under Requirement R9, but did so more than 110 calendar days, but less than or equal to 120 calendar days. OR The responsible entity failed to have an unaffiliated third party review the evaluation performed under Requirement R8 and the security plan(s) developed under Requirement R9. OR The responsible entity had an unaffiliated third party review the evaluation performed under Requirement R8 and the security plan(s) developed under Requirement R9, but failed to implement procedures for protecting information per Part 10.4.	The responsible entity failed to have an unaffiliated third party review the evaluation performed under Requirement R8 and the security plan(s) developed under Requirement R9 in more than 120 calendar days.

	modifying the security plan(s) as specified in Part 10.3.		

VSL Justifications for CIP-014-4, Requirement R10	
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	This is an existing Requirement. The drafting team revised the VSL language for consistency with the proposed revisions to the standard. All of the violation severity levels stayed the same from the previously FERC-approved version
FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	The proposed VSLs are not binary and do not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.
FERC VSL G3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	The proposed VSLs use the same terminology as used in the associated requirement and are, therefore, consistent with the requirement.
FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative	Each VSL is based on a single violation and not cumulative violations.

[1] NERC developed this Reliability Standard Audit Worksheet (RSAW) language in order to facilitate NERC's and the Regional Entities' assessment of a registered entity's compliance with this Reliability Standard. The NERC RSAW language is written to specific versions of each NERC Reliability Standard. Entities using this RSAW should choose the version of the RSAW applicable to the Reliability Standard being assessed. While the information included in this RSAW provides some of the methodology that NERC has elected to use to assess compliance with the requirements of the Reliability Standard, this document should not be treated as a substitute for the Reliability Standard or viewed as additional Reliability Standard requirements. In all cases, the Regional Entity should rely on the language contained in the Reliability Standard itself, and not on the language contained in this RSAW, to determine compliance with the Reliability Standard. NERC's Reliability Standards can be found on NERC's website. Additionally, NERC Reliability Standards are updated frequently, and this RSAW may not necessarily be updated with the same frequency. Therefore, it is imperative that entities treat this RSAW as a reference document only, and not as a substitute or replacement for the Reliability Standard. It is the responsibility of the registered entity to verify its compliance with the latest approved version of the Reliability Standards, by the applicable governmental authority, relevant to its registration status.

The NERC RSAW language contained within this document provides a non-exclusive list, for informational purposes only, of examples of the types of evidence a registered entity may produce or may be asked to produce to demonstrate compliance with the Reliability Standard. A registered entity's adherence to the examples contained within this RSAW does not necessarily constitute compliance with the applicable Reliability Standard, and NERC and the Regional Entity using this RSAW reserves the right to request additional evidence from the registered entity that is not included in this RSAW. Additionally, this RSAW includes excerpts from FERC Orders and other regulatory references. The FERC Order cites are provided for ease of reference only, and this document does not necessarily include all applicable Order provisions. In the event of a discrepancy between FERC Orders, and the language included in this document, FERC Orders shall prevail.

[2] Compliance Assessment Date(s): The date(s) the actual compliance assessment (on-site audit, off-site spot check, etc.) occurs.

Note to Auditors Concerning Third Party Verifications and Reviews

Requirements R6 and R10 prescribe, respectively, unaffiliated third party verifications for Requirement R5 and unaffiliated third party reviews for Requirements R8 and R9. Auditors are encouraged to rely on the verifications and reviews performed in cases where the verifying or reviewing entities are qualified, unaffiliated with the audited entity, and the scope of their verification or review is clear. The concept of reliance means using the work of others to avoid duplication of efforts and is consistent with recognized professional auditing standards, which are required for Compliance Audits per NERC's Rules of Procedure. Reliance in the context of this Reliability Standard means using the Requirement R6 verifications and Requirement R10 reviews to reduce audit risk and the related rigor of audit testing for Requirements R5, R8, and R9. However, in cases where the verifying or reviewing entity lacks the qualifications specified in Requirement R6 for verifications, or Requirement R10 for reviewers, the required non-affiliation from the audited entity, or where the scope of the third-party entity's verification or review is unclear, auditors may need to apply audit testing of Requirements R5, R8, or R9. For this reason, the Evidence Requested and Compliance Assessment Approach Sections are still present in this RSAW for Requirements R5, R8, and R9. We anticipate those sections will also facilitate expectations for entities and their unaffiliated third-party verifiers and reviewers, assist Electric Reliability Organization (ERO) Enterprise auditors to understand the audit procedures applied by unaffiliated third party verifiers and reviewers, and provide transparency between ERO Enterprise auditors and Industry, should circumstances require audit testing of Requirements R5, R8, or R9. Further, it is an objective of the ERO Enterprise (collectively NERC and Regional Entities) to have transparent Evidence Requests and Compliance Assessment Approaches for every enforceable standard, whether they are in audit scope or not.

DRAFT

R1 Supporting Evidence and Documentation

R1. Each Transmission Owner shall, at least once every 36 calendar months, shall identify each applicable Transmission station and Transmission substation meeting any of the criteria in Attachment 1 that is either existing or planned to be in service within 36 calendar months.

M1. Examples of evidence may include, but are not limited to, dated written or electronic documentation of the Transmission station(s) and Transmission substation(s) (existing and those planned to be in service within 36 calendar months) that meet any of the criteria in Attachment 1.

Registered Entity Response (Required):

Compliance Narrative:

Provide a brief explanation, in your own words, of how you comply with this Requirement. References to supplied evidence, including links to the appropriate page, are recommended.

Evidence Requested[i]:

Provide the following evidence, or other evidence to demonstrate compliance.
(R1) List of existing Transmission stations/substations that meet any of the criteria in Attachment 1.
(R1) List of Transmission stations/substations planned in the next 36 calendar months that meet any of the criteria in Attachment 1.

Registered Entity Evidence (Required):

The following information is requested for each document submitted as evidence. Also, evidence submitted should be highlighted and bookmarked, as appropriate, to identify the exact location where evidence of compliance may be found.					
File Name	**Document Title**	**Revision or Version**	**Document Date**	**Relevant Page(s) or Section(s)**	**Description of Applicability of Document**

Audit Team Evidence Reviewed (This section to be completed by the Compliance Enforcement Authority):

Compliance Assessment Approach Specific to CIP-014-4, R1

This section to be completed by the Compliance Enforcement Authority

	(R1) Review entity's process for determining Transmission stations/substations subject to identification in accordance with Requirement R1, including the criteria described in Attachment 1.
	(R1) Verify entity's identification process includes existing Transmission stations/substations.

	(R1) Verify entity's identification process includes Transmission stations/substations planned in the next 36 calendar months.
	(R1) Review evidence that the identification was performed and verify that it occurred within the past 36 calendar months.
Note to Auditor:	

Auditor Notes:

DRAFT

R2 Supporting Evidence and Documentation

R2. Each Transmission Owner with applicable Transmission station(s) or Transmission substation(s) identified in Requirement R1 shall identify proximate existing Bulk Electric System Transmission station(s) and Bulk Electric System Transmission substation(s), irrespective of ownership, within 1500 feet or 457 meters (the shortest distance, measured substation fence line to substation fence line) of an applicable Transmission station or Transmission substation identified in Requirement R1.

M2. Examples of evidence may include, but are not limited to, dated written or electronic documentation of the Bulk Electric System Transmission stations or Bulk Electric System Transmission substations identified in Requirement R2.

Registered Entity Response (Required):

Compliance Narrative:

Provide a brief explanation, in your own words, of how you comply with this Requirement. References to supplied evidence, including links to the appropriate page, are recommended.

Evidence Requested[i]:

Provide the following evidence, or other evidence to demonstrate compliance.
(R2) Dated list of proximate existing Bulk Electric System Transmission station(s), irrespective of ownership, within 1500 feet or 457 meters of an applicable Transmission station or Transmission substation identified in Requirement R1.

Registered Entity Evidence (Required):

The following information is requested for each document submitted as evidence. Also, evidence submitted should be highlighted and bookmarked, as appropriate, to identify the exact location where evidence of compliance may be found.

File Name	Document Title	Revision or Version	Document Date	Relevant Page(s) or Section(s)	Description of Applicability of Document

Audit Team Evidence Reviewed (This section to be completed by the Compliance Enforcement Authority):

Compliance Assessment Approach Specific to CIP-014-4, R2

This section to be completed by the Compliance Enforcement Authority

	(R2) Review entity's process for determining proximate Bulk Electric System Transmission station(s) and substation(s) located within 1500 feet or 457m of an applicable Transmission station or Transmission

	substation identified in Requirement R1.
	(R2) Verify entity's process includes Bulk Electric System Transmission station(s) and substation(s) are identified irrespective of ownership.
	(R2) Verify entity's process includes measuring the shortest distance, measured substation fence line to substation fence line.
Note to Auditor:	

Auditor Notes:

DRAFT

R3 Supporting Evidence and Documentation

R3. Each Transmission Owner shall have a documented risk assessment methodology for evaluating the loss of each applicable Transmission station or Transmission substation identified in Requirement R1. The methodology shall include, at a minimum, the following:

3.1. Documented criteria for assessing instability, uncontrolled separation, or Cascading within an Interconnection. The criteria shall include, at a minimum, technically justified thresholds identifying unacceptable generation and load loss within an Interconnection.

3.2. A provision that steady-state and dynamic simulations shall each be performed using at a minimum one System peak Load case and one System Off-Peak Load case.

3.3. Specifications for simulations at each applicable Transmission station or Transmission substation identified in accordance with Requirement R1 and, if applicable, at each associated proximate existing Bulk Electric System Transmission station(s) and Bulk Electric System Transmission substation(s) identified in accordance with Requirement R2, that include:

3.3.1. At the applicable Transmission station or Transmission substation:

3.3.1.1. Prior loss of communication and Protection Systems;

3.3.1.2. Application of a Fault or Faults; and

3.3.1.3. Delayed (remote) clearing times shall be used unless otherwise technically substantiated.

3.3.2. At each proximate existing Bulk Electric System Transmission station(s) and Bulk Electric System Transmission substation(s), as applicable:

3.3.2.1. Application of a Fault or Faults, either simultaneous with or following the Fault or Faults applied under Part 3.3.1.2; and

3.3.2.2. Normal clearing times shall be used unless otherwise technically substantiated.

3.3.3. A documented justification for the Fault(s) associated with physical attack to be simulated. A single justification may be used for multiple locations. The justification shall include at a minimum:

3.3.3.1. The type of credible high-severity physical attack considered; and

3.3.3.2. The type of Fault(s) selected based upon the attack considered.

3.3.4. Removal of all Elements that Protection Systems and other controls are expected to automatically disconnect.

3.3.5. Actual or more conservative clearing times shall be used.

M3. Each Transmission Owner shall provide dated evidence, such as electronic or hard copies, of a risk assessment methodology satisfying Requirement R3.

DRAFT

Registered Entity Response (Required):

Compliance Narrative:

Provide a brief explanation, in your own words, of how you comply with this Requirement. References to supplied evidence, including links to the appropriate page, are recommended.

Evidence Requested[i]:

Provide the following evidence, or other evidence to demonstrate compliance.
(R3) Provide a dated risk assessment methodology which includes, at a minimum, the requirements of Requirement R3.

Registered Entity Evidence (Required):

The following information is requested for each document submitted as evidence. Also, evidence submitted should be highlighted and bookmarked, as appropriate, to identify the exact location where evidence of compliance may be found.					
File Name	**Document Title**	**Revision or Version**	**Document Date**	**Relevant Page(s) or Section(s)**	**Description of Applicability of Document**

Audit Team Evidence Reviewed (This section to be completed by the Compliance Enforcement Authority):

Compliance Assessment Approach Specific to CIP-014-4, R3

This section to be completed by the Compliance Enforcement Authority

	(R3) Verify entity has a documented risk assessment methodology for evaluating the loss of each applicable Transmission station or Transmission substation identified in Requirement R1.
	(R3 Part 3.1) Verify the entity's risk assessment methodology includes criteria for assessing instability, uncontrolled separation, or Cascading within an Interconnection. This should include thresholds identifying unacceptable generation and load loss within an Interconnection.
	(R3 Part 3.2) Verify the entity's risk assessment methodology includes a provision to perform steady-state and dynamic studies for a minimum of one System peak Load case and one System Off-Peak Load case.
	(R3 Part 3.3) Verify entity documented specifications for simulations at each applicable Transmission station or Transmission substation identified in Requirement R1.
	(R3 Part 3.3) If applicable, verify entity documented specifications for simulations at each associated proximate existing Bulk Electric System Transmissions station(s) and substation(s) identified in Requirement R2.
	Verify entity specifications for simulations at applicable Transmission stations or substations include prior

	loss of communication and Protection Systems (R3 Part 3.3.1.1), application of a Fault or Faults (R3 Part 3.3.1.2), and delayed (remote) clearing times were used unless otherwise technically substantiated (R3 Part 3.3.1.3).
	If applicable, verify entity specifications for simulations at each proximate existing Bulk Electric System Transmission station(s) or substation(s) include application of a Fault or Faults, either simultaneous with or following the Fault or Faults applied under Part 3.3.1.2 (R3 Part 3.3.2.1), and normal clearing times are used unless otherwise technically substantiated (R3 Part 3.3.2.2).
	(R3 Part 3.3.3) Verify the entity's risk assessment methodology includes documenting justification for the Fault(s) associated with the physical attack that was simulated. Justifications should include the type of credible high-severity physical attack considered, and the type of Fault(s) selected based on the attack considered. A single justification may be used for multiple locations.
	(R3 Part 3.3.4) Verify the entity's risk assessment methodology specifications for simulation(s) includes removal of all Elements that Protection Systems and other controls expected to automatically disconnect.
	(R3 Part 3.3.5) Verify the entity's risk assessment methodology specifications for simulation(s) includes using actual or more conservative clearing times.
Note to Auditor:	

Auditor Notes:

R4 Supporting Evidence and Documentation

R4. Each Transmission Owner with applicable Transmission station(s) and Transmission substation(s) identified in Requirement R1 jointly owned by multiple Transmission Owners shall coordinate with each appropriate Transmission Owner(s) to determine and document their individual and joint responsibilities under Requirement R3 and Requirement R5.

M4. Examples of acceptable evidence may include, but are not limited to, dated documentation, such as meeting minutes, agreements, and email correspondence, that identifies that agreement has been reached on individual and joint responsibilities for performing the required risk assessments.

Registered Entity Response (Required):

Compliance Narrative:

Provide a brief explanation, in your own words, of how you comply with this Requirement. References to supplied evidence, including links to the appropriate page, are recommended.

Evidence Requested[i]:

Provide the following evidence, or other evidence to demonstrate compliance.
(R4) For applicable jointly owned Transmission station(s) and Transmission substation(s) identified in R1, dated evidence (e.g., meeting minutes, agreements, emails, etc.) of coordination to determine and document individual and joint responsibilities for Requirement R3 and Requirement R5.

Registered Entity Evidence (Required):

The following information is requested for each document submitted as evidence. Also, evidence submitted should be highlighted and bookmarked, as appropriate, to identify the exact location where evidence of compliance may be found.					
File Name	**Document Title**	**Revision or Version**	**Document Date**	**Relevant Page(s) or Section(s)**	**Description of Applicability of Document**

Audit Team Evidence Reviewed (This section to be completed by the Compliance Enforcement Authority):

Compliance Assessment Approach Specific to CIP-014-4, R4

This section to be completed by the Compliance Enforcement Authority

	(R4) Verify the entity documented evidence of agreements made with Transmission Owners of jointly owned Transmission station(s) and Transmission substation(s) identified in R1 and documents individual and joint responsibilities for Requirement R3 and Requirement R5.

Note to Auditor:

Auditor Notes:

DRAFT

R5 Supporting Evidence and Documentation

R5. At least once every 36 calendar months, each Transmission Owner shall perform a risk assessment to identify applicable Transmission station(s) and Transmission substation(s) identified in Requirement R1, that if rendered inoperable or damaged could result in instability, uncontrolled separation, or Cascading within an Interconnection, using the methodology established in Requirement R3. Jointly owned Transmission station(s) and Transmission substation(s) shall be assessed according to the responsibilities documented under Requirement R4. If proximate Bulk Electric System Transmission station(s) and Bulk Electric System Transmission substation(s) were identified in Requirement R2, they shall be included in the risk assessment according to Requirement R3, Part 3.3.

5.1. If during a risk assessment, a Transmission station or Transmission substation is identified in either the dynamic or steady-state simulation as causing instability, uncontrolled separation, or Cascading within an Interconnection when rendered inoperable or damaged, then no further simulation is required.

5.2. If a previous risk assessment has identified a Transmission station or Transmission substation as causing instability, uncontrolled separation, or Cascading within an Interconnection when rendered inoperable or damaged, then the Transmission Owner may forgo additional assessments on that Transmission station or Transmission substation. Requirement R5, Part 5.3 and Requirement R7 through Requirement R10 still apply to that Transmission station or Transmission substation until a new risk assessment demonstrates otherwise.

5.3. The Transmission Owner shall identify the primary control center that operationally controls each Transmission station or Transmission substation identified as causing instability, uncontrolled separation, or Cascading within an Interconnection when rendered inoperable or damaged in the Requirement R5 risk assessment.

M5. Examples of acceptable evidence may include, but are not limited to, dated written or electronic documentation of the risk assessment satisfying Requirement R5 including the identified Transmission station(s) or Transmission substation(s). For Requirement R5, Part 5.3, examples of acceptable evidence may include, but are not limited to, dated written or electronic documentation of the identification of the primary control center that operationally controls each identified Transmission station or Transmission substation.

Registered Entity Response (Required):

Compliance Narrative:

Provide a brief explanation, in your own words, of how you comply with this Requirement. References to supplied evidence, including links to the appropriate page, are recommended.

Evidence Requested[i]:

Provide the following evidence, or other evidence to demonstrate compliance.
(R5) Dated written or electronic documentation of the current and immediately preceding risk assessment performed.
(R5 Part 5.1) Dated documentation identifying Transmission station(s) or Transmission substation(s) as causing

instability, uncontrolled separation, or Cascading if rendered inoperable or damaged in either dynamic or steady-state simulation.
(R5 Part 5.2) Dated documentation that a previous risk assessment identified Transmission station(s) or Transmission substation(s) as causing instability, uncontrolled separation, or Cascading if rendered inoperable or damaged.
(R5 Part 5.3) Dated documentation identifying the primary control center that operationally controls each Transmission station or Transmission substation identified as causing instability, uncontrolled separation, or Cascading if rendered inoperable or damaged.

Registered Entity Evidence (Required):

The following information is requested for each document submitted as evidence. Also, evidence submitted should be highlighted and bookmarked, as appropriate, to identify the exact location where evidence of compliance may be found.

File Name	Document Title	Revision or Version	Document Date	Relevant Page(s) or Section(s)	Description of Applicability of Document

Audit Team Evidence Reviewed (This section to be completed by the Compliance Enforcement Authority):

Compliance Assessment Approach Specific to CIP-014-4, R5

This section to be completed by the Compliance Enforcement Authority

	(R5) Verify the entity performed a risk assessment at least once every 36 calendar months using the methodology established in Requirement R3 to identify applicable Transmission station(s) and Transmission substation(s) identified in Requirement R1, that if rendered inoperable or damaged could result in instability, uncontrolled separation, or Cascading.
	(R5) Verify jointly owned Transmission station(s) and Transmission substation(s), if any, were assessed according to the responsibilities documented under Requirement R4.
	(R5) Verify proximate Bulk Electric System Transmission station(s) and Bulk Electric System Transmission substation(s) identified in R2, if any, were included in the risk assessment according to Requirement R3, Part 3.3.
	(R5 Part 5.1) Verify the entity identified Transmission station(s) and Transmission substation(s) causing instability, uncontrolled separation, or Cascading when rendered inoperable or damaged in either dynamic or steady-state simulation during a risk assessment.
	(R5 Part 5.2) Verify the entity identified Transmission station(s) or Transmission substation(s) from previous risk assessments as causing instability, uncontrolled separation, or Cascading when rendered inoperable or damaged to forgo additional assessments, if any.
	(R5 Part 5.3) Verify the entity identified primary control center(s) that operationally control each

	Transmission station or Transmission substation identified as causing instability, uncontrolled separation, or Cascading within an Interconnection when rendered inoperable or damaged in the Requirement R5 risk assessment.

Note to Auditor:
If any previous risk assessments were used to forgo additional assessments on Transmission station(s) and Transmission substation(s) using the Requirement R3 risk assessment methodology, the Transmission station(s) and Transmission substation(s) will apply to Requirement R5, Part 5.3, and Requirements R7 through R10 until a new risk assessment demonstrates otherwise.

Auditor Notes:

DRAFT

R6 Supporting Evidence and Documentation

R6. Each Transmission Owner shall have an unaffiliated third party verify the risk assessment performed under Requirement R5. The verification may occur concurrently with or after the risk assessment performed under Requirement R5.

6.1. Each Transmission Owner shall select an unaffiliated verifying entity that is either

- A registered Planning Coordinator, Transmission Planner, or Reliability Coordinator; or
- An entity that has transmission planning or analysis experience.

6.2. The unaffiliated third-party verification shall verify the Transmission Owner's risk assessment performed under Requirement R5, which may include recommendations for the addition or deletion of a Transmission station(s) or Transmission substation(s). The Transmission Owner shall ensure the verification is completed within 90 calendar days following the completion of the Requirement R5 risk assessment.

6.3. If the unaffiliated verifying entity recommends that the Transmission Owner add a Transmission station(s) or Transmission substation(s) to, or remove a Transmission station or Transmission substation from, its identification under Requirement R5, the Transmission Owner shall either, within 60 calendar days of completion of the verification, for each recommended addition or removal of a Transmission station or Transmission substation:

- Modify its identification under Requirement R5 consistent with the recommendation; or
- Document the technical basis for not modifying the identification in accordance with the recommendation.

6.4. Each Transmission Owner shall implement procedures, such as the use of nondisclosure agreements, for protecting sensitive or confidential information made available to the unaffiliated third-party verifier and to protect or exempt sensitive or confidential information developed pursuant to this Reliability Standard from public disclosure.

M6. Examples of acceptable evidence may include, but are not limited to, dated written or electronic documentation that the Transmission Owner completed an unaffiliated third party verification of the Requirement R5 risk assessment and satisfied all of the applicable provisions of Requirement R6, including, if applicable, documenting the technical basis for not modifying the identification in Requirements R1, R2, R3, R4, and R5 as specified under Part 6.3. Additionally, examples of evidence may include, but are not limited to, written or electronic documentation of procedures to protect information under Part 6.4.

Registered Entity Response (Required):

Compliance Narrative:

Provide a brief explanation, in your own words of how you comply with this Requirement. References to supplied evidence, including links to the appropriate page, are recommended.

Evidence Requested[i]:

Provide the following evidence, or other evidence to demonstrate compliance.
(R6) Dated evidence of unaffiliated third-party verification of the entity's risk assessment performed under Requirement R5.
(R6 Part 6.1) Documented qualifications of the verifying party.
(R6 Part 6.3) Recommendations, if any, of the verifying party related to Requirement R5 risk assessments.
(R6 Part 6.3) Documentation of modifications and implementation of recommendations or technical basis for not implementing recommendations of the verifying party.
(R6 Part 6.4) Evidence that procedures were implemented to protect sensitive and confidential information.

Registered Entity Evidence (Required):

The following information is requested for each document submitted as evidence. Also, evidence submitted should be highlighted and bookmarked, as appropriate, to identify the exact location where evidence of compliance may be found.					
File Name	**Document Title**	**Revision or Version**	**Document Date**	**Relevant Page(s) or Section(s)**	**Description of Applicability of Document**

Audit Team Evidence Reviewed (This section to be completed by the Compliance Enforcement Authority):

Compliance Assessment Approach Specific to CIP-014-4, R6

This section to be completed by the Compliance Enforcement Authority

	(R6) Review evidence of third-party verification of the entity's risk assessment and verify the following:
	(R6 Part 6.1) The reviewing entity is registered in accordance with Requirement R6.1 or has transmission planning or analysis experience.
	(R6 Part 6.2) Verification was performed within 90 calendar days of the completion of the Requirement R5 risk assessment.
	(R6 Part 6.3) If the unaffiliated verifying entity provided any recommendations, the entity, within 60 days of the completion of the verification, either documented modifications and implementation of recommendations or documented a technical basis for not implementing recommendations of the verifying party.
	(R6 Part 6.4) Review non-disclosure agreement (or other evidence) to verify procedures for protecting sensitive or confidential information between the entity and third-party were implemented.
Note to Auditor: The third-party verification may occur concurrently with or after the risk assessment performed under Requirement R5.	

Auditor Notes:

DRAFT

R7 Supporting Evidence and Documentation

R7. For a primary control center(s) identified by the Transmission Owner according to Requirement R5, Part 5.3 that a) operationally controls an identified Transmission station or Transmission substation verified according to Requirement R6, and b) is not under the operational control of the Transmission Owner: the Transmission Owner shall, within seven calendar days following completion of Requirement R6, notify the Transmission Operator that has operational control of the primary control center of such identification and the date of completion of Requirement R6.

7.1. If a Transmission station or Transmission substation previously identified under Requirements R1 and R5 and verified according to Requirement R6 is removed from the identification during a subsequent risk assessment performed according to Requirement R5 or a verification according to Requirement R6, then the Transmission Owner shall, within seven calendar days following the verification or the subsequent risk assessment, notify the Transmission Operator that has operational control of the primary control center of the removal.

M7. Examples of acceptable evidence may include, but are not limited to, written or electronic notifications or communications that the Transmission Owner notified each Transmission Operator, as applicable, according to Requirement R7.

Registered Entity Response (Required):

Question: Are there any primary control centers identified in Requirement R5, Part 5.3 that are not under operational control of your NERC registration? ☐ Yes ☐ No

If "Yes," provide details below.

Registered Entity Response (Required):

Compliance Narrative:

Provide a brief explanation, in your own words of how you comply with this Requirement. References to supplied evidence, including links to the appropriate page, are recommended.

Evidence Requested[i]:

Provide the following evidence, or other evidence to demonstrate compliance.
(R7) If applicable, dated communications with Transmission Operators demonstrating notification and the date of completion of Requirement R6.

Registered Entity Evidence (Required):

The following information is requested for each document submitted as evidence. Also, evidence submitted should be highlighted and bookmarked, as appropriate, to identify the exact location where evidence of compliance may be found.

File Name	Document Title	Revision or Version	Document Date	Relevant Page(s) or Section(s)	Description of Applicability of Document

Audit Team Evidence Reviewed (This section to be completed by the Compliance Enforcement Authority):

Compliance Assessment Approach Specific to CIP-014-4, R7

This section to be completed by the Compliance Enforcement Authority

	(R7) For each applicable primary control center identified in Requirement R5 Part 5.3 not under the control of the entity's registration, verify notification exists and contains the date of completion of Requirement R6, and ensure the responsible Transmission Operator was notified within seven calendar days of the completion of R2.
	(R7 Part 7.1) For each Transmission station/substation removed under Part 7.1, ensure the responsible Transmission Operator was notified of the removal within seven calendar days of removal from identification.
Note to Auditor: Note the entity's response to the above Question. If auditor can verify the entity's answer of 'No,' then Requirement R7 is not applicable, and no further audit testing is required.	

Auditor Notes:

R8 Supporting Evidence and Documentation

R8. Each Transmission Owner that identified a Transmission station, Transmission substation, or a primary control center in Requirement R5 and verified according to Requirement R6, and each Transmission Operator notified by a Transmission Owner according to Requirement R7, shall conduct an evaluation of the potential threats and vulnerabilities of a physical attack to each of their respective Transmission station(s), Transmission substation(s), and primary control center(s) identified in Requirement R5 and verified according to Requirement R6. The evaluation shall consider the following:

8.1. Unique characteristics of the identified and verified Transmission station(s), Transmission substation(s), and primary control center(s);

8.2. Prior history of attack(s) on similar facilities taking into account the frequency, geographic proximity, and severity of past physical security related events; and

8.3. Intelligence or threat warnings received from sources such as law enforcement, the Electric Reliability Organization (ERO), the Electricity Sector Information Sharing and Analysis Center (E-ISAC), U.S. federal and/or Canadian governmental agencies, or their successors.

M8. Examples of evidence may include, but are not limited to, dated written or electronic documentation that the Transmission Owner or Transmission Operator conducted an evaluation of the potential threats and vulnerabilities of a physical attack to their respective Transmission station(s), Transmission substation(s), and primary control center(s) as specified in Requirement R8.

Registered Entity Response (Required):

Compliance Narrative:

Provide a brief explanation, in your own words of how you comply with this Requirement. References to supplied evidence, including links to the appropriate page, are recommended.

Evidence Requested[i]:

Provide the following evidence, or other evidence to demonstrate compliance.
(R8) A description of the entity's process for executing the evaluation prescribed in Requirement R8.
(R8) Dated documentation that the Transmission Owner or Transmission Operator conducted an evaluation of the potential threats and vulnerabilities of a physical attack to their respective Transmission station(s), Transmission substation(s), and primary control center(s) as specified in Requirement R8.

Registered Entity Evidence (Required):

The following information is requested for each document submitted as evidence. Also, evidence submitted should be highlighted and bookmarked, as appropriate, to identify the exact location where evidence of compliance may be found.					
File Name	**Document Title**	**Revision or Version**	**Document Date**	**Relevant Page(s) or Section(s)**	**Description of Applicability of Document**

Audit Team Evidence Reviewed (This section to be completed by the Compliance Enforcement Authority):

Compliance Assessment Approach Specific to CIP-014-4, R8

This section to be completed by the Compliance Enforcement Authority

	(R8) Review evidence of evaluation and verify it considers the following:
	(R8) Potential threats and vulnerabilities as described in Requirement R8.
	(R8 Part 8.1) Unique characteristics as described in Requirement R8 Part 8.1.
	(R8 Part 8.2) Prior history of attack on similar facilities taking into account the frequency, geographic proximity, and severity of past physical security related events
	(R8 Part 8.3) Intelligence or warnings as described in Requirement R8 Part 8.3.
Note to Auditor: See above Note concerning Third Party Verifications for important details regarding audit risk assessment and related rigor of audit procedures to be applied for this Requirement. Auditor should cross reference the Transmission stations/substations and primary control centers identified in the risk assessment performed under Requirement R5 to the evaluation prescribed in Requirement R8 to ensure it is complete.	

Auditor Notes:

R9 Supporting Evidence and Documentation

R9. Each Transmission Owner that identified a Transmission station, Transmission substation, or primary control center in Requirement R5 and verified according to Requirement R6, and each Transmission Operator notified by a Transmission Owner according to Requirement R7, shall develop and implement a documented physical security plan(s) that covers their respective Transmission station(s), Transmission substation(s), and primary control center(s). The physical security plan(s) shall be developed within 120 calendar days following the completion of Requirement R6 and executed according to the timeline specified in the physical security plan(s). The physical security plan(s) shall include the following attributes:

9.1. Resiliency or security measures designed collectively to deter, detect, delay, assess, communicate, and respond to potential physical threats and vulnerabilities identified during the evaluation conducted in Requirement R8.

9.2. Law enforcement contact and coordination information.

9.3. A timeline for executing the physical security enhancements and modifications specified in the physical security plan.

9.4. Provisions to evaluate evolving physical threats, and their corresponding security measures, to the Transmission station(s), Transmission substation(s), or primary control center(s).

M9. Examples of evidence may include, but are not limited to, dated written or electronic documentation of its physical security plan(s) that covers their respective identified and verified Transmission station(s), Transmission substation(s), and primary control center(s) as specified in Requirement R6, and additional evidence demonstrating execution of the physical security plan according to the timeline specified in the physical security plan.

Registered Entity Response (Required):

Compliance Narrative:

Provide a brief explanation, in your own words of how you comply with this Requirement. References to supplied evidence, including links to the appropriate page, are recommended.

Evidence Requested[i]:

Provide the following evidence, or other evidence to demonstrate compliance.
(R9) Dated physical security plan(s).

Registered Entity Evidence (Required):

The following information is requested for each document submitted as evidence. Also, evidence submitted should be highlighted and bookmarked, as appropriate, to identify the exact location where evidence of compliance may be found.					
File Name	**Document Title**	**Revision or Version**	**Document Date**	**Relevant Page(s)**	**Description of Applicability of Document**

				or Section(s)	

Audit Team Evidence Reviewed (This section to be completed by the Compliance Enforcement Authority):

Compliance Assessment Approach Specific to CIP-014-4, R9

This section to be completed by the Compliance Enforcement Authority

Note to Auditor:	
	(R9) Review evidence and verify the physical security plan(s) covers the Transmission stations/substations and primary controls identified in Requirements R5 and/or R6, and verify plan was developed within 120 calendar days following the completion of Requirement R6 and executed according to the timeline specified in the physical security plan(s). In addition, verify the plan includes the following attributes:
	(R9 Part 9.1) Resiliency or security measures designed collectively to deter, detect, delay, assess, communicate, and respond to potential physical threats and vulnerabilities identified during the evaluation conducted in Requirement R8.
	(R9 Part 9.2) Law enforcement contact and coordination information.
	(R9 Part 9.3) A timeline for executing physical security enhancements and modifications specified in the physical security plan.
	(R9 Part 9.4) Provisions to evaluate evolving physical threats, and their corresponding security measures in accordance with Requirement R9 Part 9.4.
	(R9) Verify implementation of physical security plan(s). See 'Note to Auditor' for details

Note to Auditor: See above Note concerning Third Party Verifications for important details regarding audit risk assessment and related rigor of audit procedures to be applied for this Requirement.

Auditor should cross reference the Transmission stations/substations and primary control centers identified in the risk assessment performed under Requirement R5 to the evaluation prescribed in Requirement R8 and the security plan(s) prescribed in Requirement R9 to ensure the plan addresses vulnerabilities to physical attacks per the evaluation conducted in Requirement R8.

Requirement R9 includes implementation of the security plan(s), which is not within the scope of the third-party review described in Requirement R10. Auditors can gain reasonable assurance security plan(s) was/were implemented by determining if specific actions prescribed by the plan(s) have taken place within the timelines established by the plan(s). For example, if the plan calls for certain procedures to occur, then auditors could ask for evidence demonstrating that the procedure has been implemented within the timeline established in the security plan. Also, if the plan calls for construction of a barrier, an auditor could verify evidence that such a barrier was constructed in accordance with the entity's timeline. As auditors should obtain reasonable, not absolute, assurance the plan(s) was/were implemented, testing implementation on a

sample basis may be appropriate.

Auditor Notes:

DRAFT

R10 Supporting Evidence and Documentation

R10. Each Transmission Owner that identified a Transmission station, Transmission substation, or primary control center in Requirement R5 and verified according to Requirement R6, and each Transmission Operator notified by a Transmission Owner according to Requirement R7, shall have an unaffiliated third party review the evaluation performed under Requirement R8 and the security plan(s) developed under Requirement R9. The review may occur concurrently with or after completion of the evaluation performed under Requirement R8 and the security plan development under Requirement R9.

10.1. Each Transmission Owner and Transmission Operator shall select an unaffiliated third-party reviewer from the following:

- An entity or organization with electric industry physical security experience and whose review staff has at least one member who holds either a Certified Protection Professional (CPP) or Physical Security Professional (PSP) certification;
- An entity or organization approved by the ERO;
- A governmental agency with physical security expertise; or
- An entity or organization with demonstrated law enforcement, government, or military physical security expertise.

10.2. The Transmission Owner or Transmission Operator, respectively, shall ensure that the unaffiliated third-party review is completed within 90 calendar days of completing the security plan(s) developed in Requirement R9. The unaffiliated third-party review may, but is not required to, include recommended changes to the evaluation performed under Requirement R8 or the security plan(s) developed under Requirement R9.

10.3. If the unaffiliated third-party reviewer recommends changes to the evaluation performed under Requirement R8 or security plan(s) developed under Requirement R9, the Transmission Owner or Transmission Operator shall, within 60 calendar days of the completion of the unaffiliated third party review, for each recommendation:

- Modify its evaluation or security plan(s) consistent with the recommendation; or
- Document the reason(s) for not modifying the evaluation or security plan(s) consistent with the recommendation.

10.4. Each Transmission Owner and Transmission Operator shall implement procedures, such as the use of non-disclosure agreements, for protecting sensitive or confidential information made available to the unaffiliated third-party reviewer and to protect or exempt sensitive or confidential information developed pursuant to this Reliability Standard from public disclosure.

M10. Examples of evidence may include, but are not limited to, written or electronic documentation that the Transmission Owner or Transmission Operator had an unaffiliated third party review the evaluation performed under Requirement R8 and the security plan(s) developed under Requirement R9 as specified in Requirement R10 including, if applicable, documenting the reasons for not modifying the evaluation or security plan(s) in accordance with a recommendation under Part 10.3. Additionally,

examples of evidence may include, but are not limited to, written or electronic documentation of procedures to protect information under Part 10.4.

Registered Entity Response (Required):

Compliance Narrative:

Provide a brief explanation, in your own words of how you comply with this Requirement. References to supplied evidence, including links to the appropriate page, are recommended.

Evidence Requested[i]:

Provide the following evidence, or other evidence to demonstrate compliance.
(R10) Dated Evidence of unaffiliated third-party review of entity's Requirement R8 evaluation and Requirement R9 security plan(s).
(R10 Part 10.1) Evidence that reviewing entity staff meets qualifications identified in Part 10.1.
(R10 Part 10.3) Recommendations of third-party reviewer related to Requirement R8 evaluation and Requirement R9 security plan.
(R10 Part 10.3) Dated documentation of modifications and implementation of recommendations or reasons and compensating mitigating measures for not implementing recommendations of the third-party reviewer.
(R10 Part 10.4) Evidence that procedures were implemented to protect sensitive and confidential information.

Registered Entity Evidence (Required):

The following information is requested for each document submitted as evidence. Also, evidence submitted should be highlighted and bookmarked, as appropriate, to identify the exact location where evidence of compliance may be found.					
File Name	**Document Title**	**Revision or Version**	**Document Date**	**Relevant Page(s) or Section(s)**	**Description of Applicability of Document**

Audit Team Evidence Reviewed (This section to be completed by the Compliance Enforcement Authority):

Compliance Assessment Approach Specific to CIP-014-4, R10

This section to be completed by the Compliance Enforcement Authority

	(R10) Review evidence and verify the physical security plan(s) and the Requirement R8 evaluation have been reviewed by an unaffiliated third party. Also, review evidence and verify the following:
	(R10 Part 10.1) Reviewing party has the qualifications identified in Part 10.1.
	(R10 Part 10.2) Review is dated within 90 calendar days of completion of the Requirement R9 security

	plan.
	(R10 Part 10.3) Reviewing entity recommended changes to security plan(s) were made by entity or the reason(s) for not making the change(s) was/were documented within 60 calendar days of the completion of the unaffiliated third-party review.
	(R10 Part 10.4) Review non-disclosure agreement (or other evidence) to verify procedures for protecting sensitive or confidential information between the entity and third party were implemented.
Note to Auditor: The third-party review may occur concurrently with or after the evaluation performed under Requirement R8 or the security plan develop under Requirement R9.	

Auditor Notes:

DRAFT

Additional Information

The full text of CIP-014-4 may be found on the NERC website (www.nerc.com) under "Standards", "Reliability Standards."

In addition to the Reliability Standard, the NERC webpage for the Reliability Standard will have a link to the applicable Implementation Plan.

In addition to the Reliability Standard, there is background information available on the NERC website. Capitalized terms in the Reliability Standard refer to terms in the NERC Glossary, which may be found on the NERC website.

Sampling Methodology

Sampling is essential for auditing compliance with NERC Reliability Standards since it is not always possible or practical to test 100% of either the equipment, documentation, or both, associated with the full suite of enforceable standards. The Sampling Methodology Guidelines and Criteria (see NERC website), or sample guidelines provided by the ERO help to establish a minimum sample set for monitoring and enforcement uses in audits of NERC Reliability Standards.

Regulatory Language

See FERC Docket No. RD23-2-000.

Revision History for RSAW

Version	Date	Reviewers	Revision Description
1	05/27/2026	NERC Compliance Assurance	Initial Draft

[i] Items in the Evidence Requested section are suggested evidence that may but will not necessarily, demonstrate compliance. These items are not mandatory and other forms and types of evidence may be submitted at the entity's discretion.

DRAFT

Standards Announcement

Project 2023-06 CIP-014 Risk Assessment Refinement

Final Ballot Open through June 8, 2026

Now Available

A final ballot for **2023-06 CIP-014 Risk Assessment Refinement** is open through **8 p.m. Eastern, Monday, June 8, 2026**.

Balloting

In the final ballot, votes are counted by exception. Votes from the previous ballot are automatically carried over in the final ballot. Only members of the applicable ballot pools can cast a vote. Ballot pool members who previously voted have the option to change their vote in the final ballot. Ballot pool members who did not cast a vote during the previous ballot can vote in the final ballot.

Members of the ballot pool(s) associated with this project can log into the Standards Balloting and Commenting System (SBS) and submit votes here.

- *Contact NERC IT support directly at https://support.nerc.net/ (Monday – Friday, 8 a.m. - 5 p.m. Eastern) for problems regarding accessing the SBS due to a forgotten password, incorrect credential error messages, or system lock-out.*
- *Passwords expire every **6 months** and must be reset.*
- *The SBS **is not** supported for use on mobile devices.*
- *Please be mindful of ballot and comment period closing dates. We ask to **allow at least 48 hours** for NERC support staff to assist with inquiries. Therefore, it is recommended that users try logging into their SBS accounts **prior to the last day** of a comment/ballot period.*

Next Steps

The voting results will be posted and announced after the ballots close. If approved, the standard will be submitted to the Board of Trustees for adoption and then filed with the appropriate regulatory authorities.

For more information on the Standards Development Process, refer to the Standard Processes Manual

For more information or assistance, please contact **Ben Wu via email or at 470-542-6882.**

BALLOT RESULTS
